But woods sold under this name have also reddish, greenish, or yellowish hues, and are distinguished in commerce as red, green, and yellow ebones, though these are in much less esteem than the ebones which are jet black, free from veins, and close-grained. Mottled ebony is furnished by some species of Exoreccora, Nectandra, and Jacaranda. The jet black kinds are employed for ornamental furniture, cabinet and turnery work, for rulers, handles for doors, knives, piano-forte keys, philosophical, musical, and surgical instruments, mosaic work and inlaying, though cheaper woods, dyed black, are frequently substituted. It is much affected by the weather, on which account it is seldom used in the plank solid. It is mentioned in Ezekiel xxvi. 15, but in the plural, when the men of Dedan are described as bringing horns of ivory and ebony. Herodotus (iii. 97) mentions ebony as part of the presents brought in considerable quantities to the king of Persia by the people of Ethiopia; and Dioscorides describes two kinds, one Ethiopian, which was considered the better, and the other Indian, which was intermixed with whitish stripes and spotted. Diospyros eburnum, Retz, affords the most valuable ebony of Ceylon; but other allied Indian species, as D. melanopanax, afford excellent cabinet wood. D. quaesita of Ceylon affords the beautiful calamander wood. Other Indian species, however, yield ebony, characterized by its extremely dark colour and hardness, the heart-wood (duramen) of the tree; the sap-wood (alburnum) being white and not durable.

The ebones of the Mauritius, Ceylon, and the south and east of Asia are equal to those of any other part of the world. The ebony in the south of the Peninsula of India is chiefly obtained from Coorg and Canara, from various species of Diospyros, and takes of a superior description, being perfectly black in colour. Smaller pieces are procured from Cuddapah, Salem, Nuggur, etc., but there is no steady demand, though for ornamental cabinet work it is peculiarly fine-veined.

That of Ceylon, from the Diospyros ebenaster, is of great value. And another heart-wood, that of the Kadoen beriyie, or bastard ebony of western Ceylon, also from species of Diospyros, is occasionally met with of extraordinary beauty. The ebones of the Palghat and Combutare districts are supposed to be from species of Diospyros, ebanaster, and Bauhinia. In none of the trees is the entire bole black, only the heart-wood, the outer and white wood being the tendua of the Mahrrats. The ebony tree of the Malabar forests, Diospyros melanoxylon, is also found growing in those of N. Canara below the Woolwa Cliffs, and near Meerjan inland. Ebony is procurable of a very superior quality in the hill stations of the Eastern Ghats, and in the annexed districts of the Northern Circars, particularly in the Ganjul district; also inland from Ellore in the Musilupatam district. Logs of Diospyros ebanaster yield an ebony richly variegated with bright brown stripes and mottled, similar in appearance to calamander wood, and also which is from species of Diospyros. The Karens have distinctive names for four different species of Tenasserim ebony trees, the salt water swamp ebony, the water ebony, the yellow ebony, and the true ebony. Under the Burmese term yendika, the wood of two different trees is sometimes seen,—one a species of ebony, and the other a leguminous tree, which, according to the descriptions of the Karens, is a species of dalbergia, and the wood resembles the blackwood of Hindustan. There is an inferior kind of ebony often seen at Moulein, from a species of Diospyros. A similar wood at Payoy is often denominated iron-wood. The Burmese ebony, known as tan, is found in the direction of Shoony-Gen, but is very scarce.

The ebony used in China is chiefly imported from the Straits, but Diospyros melanoxylon and D. eburnum grow in the island of Hainan, Yung-peh-ting in Yunnan and in Kwang-si. An inferior kind of ebony, known as camagon in the commerce of China, is supposed to be a product of the D. tomentosa. West Indian ebony is furnished by Brya ebenus? A. de C., a small tree of Jamaica. It takes a beautiful polish, and is used for making walking-sticks, inlaying, etc. Bastard ebony of the Brazil is the Jacaranda mimosifolia. Ebony sells in England at £5 to £10 a ton. The exports of it from India from 1874-75 to 1879-80 ranged in value from Rs. 3558 to Rs. 15,917.—Med. ; Smith, Chn.; Drs. Gibson, Wright, Mason, Tredgold, Holzgang, Faulkner, Cruafurd, Thevates, Voigt; Captain Dance; Mr. Rohde; Eng. Cyc.; F. v. Mueller.

ECBATANA. Lay near the Zagros mountains. It was also called Achemetha, and was the chief city of Media. According to Herodotus, Ecbatana was built near the close of the 8th century B.C., by Dejobes, the founder, or (as other authors say) the restorer of the Median monarchy. But, according to Diodorus Siculus, orientals not only described it as the capital of the first Median monarchy founded by Arbebas, but also as existing prior to the em of Semiramis. That queen in her royal progress arrived at Ecbatana, a city situated in a plain, and there built a magnificent palace. Alexander deposited in it the treasures taken from Persopolis and Pasargada; and one of the last acts of his life was a visit to Ecbatana. Williams (Essays, p. 9) affirms that the ancient Ecbatana is the modern Isfahan, the capital of Irak.
Ajami. But Sir William Jones and the chief French orientalists place Ecbatana at Tauris; and Galilius, who has been followed by D'Anville and later geographers, at Hamadan. Media for the most part is high and cold; such are the mountains to the east of Ecbatana, the mountains near Rhage and the Caspian Gates, and thence to Matiana and Armenia. It is usually now thought to be the modern Hamadan.—Williams' Essays, pp. 2-67; Strabo, xi. 13.

ECHALAT, Khassya, is the Nernium piscicidum, Roxb., the Wrightia piscicida, G. Don. Its bark yields a useful fibre. Steeped in water, the fishes die. — Voigt.

ECHENESIUS NAUCRATES, the Indian sucking fish. E. remora, Linn., the remora or sucking fish, is usually found attached to the shark. They are 6 to 12 inches long. Magnellivray says (pp. 237-8) that E. remora caused much annoyance to the fishermen by carrying baits off hooks, and appeared suddenly on the alert, darting out in a bow of 20 or more feet before the ship's bottom, when any offal was thrown overboard.

ECHINOCARPUS DASYCARPUS, Benth. A timber tree of Darjiling hills.

ECHINOPS ECHINATUS, Roxb. Oontka-tara, Hind. Camel thistle. Very common in Rajwara; canals consume it readily. Said to be also a native of Mysore. Dr. Hoffmeister says this plant occurs among the flora of the villages from the Errenghal pass to Shikpie in Chinese Tartary. — Roxb.

ECHITIS, a genus of shrubs and trailing plants of the natural order Apocynacae. Dangerous lacetaceous plants, of no known use.

ECHIUM GRANDIFLORUM, one of the Boraginaceae. E. simplex is the bugloss.

ECITON, a genus of ants. E. rufonigrum, worker, length about 11-24ths of an inch; is very common in the Karnatic; makes its nests in boles of trees, old palings, bamboo rafters, and such like. It does not care for sweet; is never seen on flowers, but devours dead animal matter. It stings very severely. E. nigrum, worker length 9-24ths of an inch, rare in Malabar, but tolerably common in parts of the Karnatic; same habits as the last. Females winged. E. rutipes, worker, length 11-48ths of an inch. E. minutum, worker, about 1-6th of an inch long, is found in the Karnatic and in Malabar on trees. — Jerdon.

ECLIPSE.

Munkhas; Munkhasif, Ar. Ecclesiis, . . . Fr.
Girhan, . . . Hind. . . .

Of Sun—Nay-kyat-hgying; of Moon—La-kyat hgying.

Celestial observations were made at Babylon B.C. 2234. The Chinese wrote of 96 eclipses, of which two are uncertain, but of the others there is no doubt, according to the missionary Gaubil, and the first mentioned by them was observed B.C. 2175. Varaha-mihira, a Hindu astronomer of the 6th century A.D., correctly described eclipses of the moon and of the sun. He says, 'In an eclipse of the moon, she enters the shadow of the earth; in a solar eclipse she obscures the sun by her shadows. Hence the commencement of a lunar eclipse does not take place from the west side, nor that of a solar eclipse from the east.' But at the present day, amongst ordinary Hindus, an eclipse is still considered to be caused by a snake's endeavouring to eat up the luminary. The Hindu myths on this point vary; but usually the Iraku or black, and Keatun or red, snakes, two giants with snake heads who seized the ambrosia, are mentioned. Another myth relates that Rahu, once a chief of the Asuras, who, from having obtained some of the ambrosia, now dwells immortal in the sky, but from time to time darts out on the sun or moon and seize them. These myths are connected with the myth of the vaishnava Hindus about the churning of the milk-sea ocean. When the Deva and the Asura, with Mount Mandara as a churning rod propped on the god Vishnu as the tortoise Kurma, and using the serpent Sesa as a whirling thong, produced the Chauda-ratna, fourteen precious products called gems. Of these fourteen products was one of which Rahu by stealth obtained a portion, and became immortal. Another product was the poison, or medicine, which the god Siva, to protect mankind, drank up. On the occurrence of an eclipse, modern Hindus, to escape from the poison, everywhere bathe themselves. On the morning of the eclipse of the sun in 1868, the Lucknow train conveyed into Cawnpur no less than 27,000 passengers to bathe in the Ganges. The learned amongst the Hindus are perfectly acquainted with the causes of eclipses. See Ketu; Rahu.

ECLEPTA ERECTA, Bhangara, dodak, nigmat, bamaro; juice used to dye hair black, also used in elephantiasis.—Powell, i. p. 359.

EDAGAI, Edagai Kula, also Edangai, meaning the Left-hand race, or successors, is, amongst the Tamil and Teling people near Madras, a social classification of certain traders and artisans, who in the early part of the 19th century assumed an importance demanding the care of the police. The sections are nine in number, viz.:

1. Pancheala, comprising five subdivisions, viz. Kammarunu, or blacksmith; Badage, or carpenter; Kanagar, or brazier or copper-smith; Kaluriga, or mason; Akasale, or goldsmith.

2. Berisith, traders.

3. Devangada, weavers.

4. Ganiagar, oil-makers.

5. Gollur, accountants of treasuries.

6. Palivan and Palawan? two tribes of cultivators, perhaps for Palligavva, a villager, a peasant.

7. Bedar, an aboriginal race of Mysore and Central Travancore.

9. Maniga, a worker in leather, a tanner, a shoemaker. The last is generally most active in contests with the Right-hand castes.

EDDANGALLI or Yeddangali. Maleal. A dry grain measure in use in Malabar, cylindrical in form, 2½ inches high, 6½ inches in diameter, or 56 cubic inches. It ought to contain 57,000 grains of kahna nuts, a kind of rice.

EDEN, a Hebrew word signifying pleasure or delight, and which was made the name of several places remarkably fruitful in their soil. The first is that province which the prophet Amos seems to notice (i. 5), when he divides Syria into three parts, viz. Damascus, the plain of Aven, and the house of Eden, called Celsius-Syria, or the hollow Syria, because the mountains of Libanus and Anti-Libanus enclose it on both sides, and make it to resemble a valley. A second place wherein several learned men have sought for the country of Eden of the Scriptures is Armenia, between the sources of the Tigris, the Euphrates, the Araxes, and the Phasis, which they suppose to be the four rivers specified by Moses (Genesis ii. 10, etc.). A third place which some have fixed on as the country of

1027
EDICTS.

EDEN.

Eden, is Chaldean, not far from the banks of the Euphrates, a country remarkable for its extreme fertility (Joel ii. 5). Chaldean tradition located it and placed it in the city of Eridhu, whose position corresponds with the modern town of Rata. Babylon has also been so named; also Ceylon, with its Adam's footmark, peak, and bridge. The Eden mentioned by Ezekiel (xxvii. 23) as a great commercial place, is supposed by some to be the modern Eden, but it presents no signs of ancient grandeur. Eden is also supposed to have been in High Asia, between the common sources of the Jihun and other grand rivers, where there was abundance of the Ficus Indica or burr-tree, sacred to the first lord, Adinath or Mahadeva. Milton (Paradise Lost, book ix.) uses this tree to describe whenAdam and Eve 'Both together went Into the thickest wood; there soon they chose The fig tree; not that kind for fruit renowned, But such as at this day, to Indians known, In Malabar or Dekhan, spreads her arms, Depending so broad and long, that in the ground The bended twigs take root, and daughters grow About the mother tree, a pillar'd shade High overarched, and echoing walks between. There oft the Indian herdsman, shunning heat, Shelters in cool, and tends his pasturing herds. Those leaves They gathered, broad as Amazonian large.'—Rajasthan, i. 25; Robinson's Travels, ii. 337.

EDEN. Sir Astley Eden, a Bengal civil servant who rose to the high offices of Chief Commissioner of British Burma, Lieutenant-Governor of Bengal, and Member of the Council of the Secretary of State for India. When the ryots of several districts in 1800 revolted against the hereditary cultivation of indigo, because it had never repaid them, he was the first to point out that every tenant-proprietor in Bengal was the virtual owner of the soil, and ought to be allowed to sow it with rice, or, under contract, to cultivate indigo or any other crop; but that this supposed freedom of contract had been overridden for two or three generations by the influence and power of the planters, backed by the wealth of merchantile houses. It remained for the Indigo Commission, for Sir J. P. Grant, the Lieut.-Governor, and for Sir Charles Wood, then Secretary of State, to refuse assent to all projects for compelling ryots to sow indigo under any law making a breach of contract a criminal offence, and to cancel a temporary enactment passed with this object. As Lieut.-Governor, the education in Bengal, the jails, the roads and railroads, the finances, all received his care. He displayed some of the best characteristics of a paternal administrator, while skillfully and surely educating the people to do something for themselves.

EDENTATA, an order of mammals, so named because some have no teeth, and others none in the jaws. They are divided into two groups, the Tardigrada or sloths, peculiar to America, and the Effodients or burrowers, comprising the armadillos of S. America, Cape, and New and Old World ant-eaters. Of these, the pangolins, of the family Manidice, of the genus Manis, occur in British India, China, Burma, Malay Peninsula, and Java. See Manis.

EDESA, now called Orfa, was the Ur of the Chaldees whence Abraham removed to Haran. It is a city on the Euphrates, where Christian, Jewish, and Buddhist tenets were discussed. Here Ephraem Syrus taught, and Syriac translations were made of the Greek and Christian works, which have preserved to us the original.—Max Müller. See Orfa; Sarug; Semitic Races.

EDGWORTHIA BUXIFOLIA. Fale. Yields an edible fruit in Kâbul, unknown in England. It is the Reptonia buxifolia, A. de C. E. chrysantha grows in great abundance in China. E. Gardneri, Meisson, is a beautiful shrub with globes of waxy, cowslip-coloured, deliciously-scented flowers. This plant is allied to daphne, from the bark of which the Nepal paper is manufactured, and is similarly utilised. E. papyrifera, Mitsu, Jap.; its bark is made into one of the papers of Japan.—Hooker, Him. Journ. i. 205; Sir J. E. Reid, p. 43.

EDIBLE BIRD NESTS are made by the Colloca bivirestris, M'Clelland; C. nidifica, Gray. The nests are found in the caverns of the limestone cliffs in the Peninsula of India, and are well known in the commerce of the Archipelago. In Java they are sold at from £500 to £589 per pikul of 1384 lbs. avoid. See Bird's Nests.

EDIBLE SEA-WEEED, Plocamia candida. Yonk puen, . BURM. Agar-agar, . MALAY. A sea-weed abundant on the Tenasserim coast, and valuable for its nutritious and medicinal properties. It was brought to notice by Dr. O'Shaughnessy as the edible moss of the Eastern Archipelago, and referred by him to the genus Fucus. The fructifications, however, being in small tubercles, the Rev. Mr. Mason considered it as a species of Agardhs genus, Sphercococcus, which now constitutes a member of the genus Plocaria. It is an allied genus with the Ceylon moss (Gigartina lichenoides), first described as Fucus amyloceleus by Dr. O'Shaughnessy, the Plocaria lichenoides of Mr. Mason; also with a species found on the coast of Devonshire in England, Pl compressa, with the Corsican moss of the Mediterranean, P. helminthochorton, also with the Agar-agar, Pl. tenax, but differs from the Irish moss or Chondrus crispus. It is not of the same natural family as the Iceland moss, which is a lichen, the Cetraria islandica. The Tenasserim moss is said to be superior to all others, as it is wholly free from the bitter principle which renders other fucil so objectionable. 100 parts contain—sulphate and muriate of soda, 9.5; sulphate and phosphate of lime, 1.0; iron, a trace, 1.47; vegetable jelly, 54.5; true starch, 15.0; wax, a trace, 0.57; ligneous fibre, 18.0.

For use, steep it for a few hours in cold rainwater, next dry by the sun's rays, and grind to a fine powder; to 250 grains add 125 of water; when hot, pass through muslin or calico, strain, and boil down till a drop placed on a cold surface gelatinizes sufficiently. With milk and sugar, and flavour with lemon-juice or sherry.

EDICTS. Asoka, the first great Buddhist regal convert, carved many edicts on the rocks at Cuttack, in Gujerat, and on the banks of the Upper Indus, besides engraving them on pillars all over the country. From these we learn that Asoka's first care after his conversion was to send missionaries to proclaim his new faith in the neighbouring lands. It does not seem, however, that they penetrated beyond Kâbul or Balûk westward. The most interesting record is that contained in the thirteenth edict of the rock-cut inscriptions, where he mentions having formed
EDOM. The patriarch of the Edomites was Esau, and they dwelt on the Dead Sea, from which they were driven by an earthquake. They were a warlike, unsettled race of Arabs, whose property was in their cattle, their waggons, and what their waggons could carry. They did not cultivate the soil, nor had they any respect for a landmark. The Nabateans were at an earlier time the tribe called Edomites. But they lost that name when they carried it to the southern portion of Judea, when called Idumeans; for when the Jews regained Idumaea, they called these Edomites the desert Naboth or Nabateans. The Nabateans professed neutrality between Antigonus and Ptolemy, the two contending powers; but the mild temper of Ptolemy had so far gained their friendship, that the haughty Antigonus, though he did not refuse their pledges of peace, secretly made up his mind to conquer them. Petra, the city of the Nabateans, is in a narrow valley between steep overhanging rocks. Not more than two horsemen can ride abreast through the chasm in the rock by which it is entered from the east, while the other entrance from the west is down a hill-side too steep for a loaded camel. Their temples and huts were cut out of the live rock, and hence the city was by the Jews named Selah, the rock, and by the Greeks named Petra, from which last the country was sometimes called Arabia Petraea. The existence of rock-cut viharas or monasteries at Petra, in the dominions of Antiochus, is of similar excavations at Cyrene, so far to confuse and elucidate this; for, though travellers have hitherto called every excavation a tomb, there can be no doubt that many of those at Petra and Cyrene and elsewhere were the abodes of living ascetics, and not burial-places.—Bunsen's Egypt, pp. 314-431; Sharpe's Egypt, i, pp. 250-51.

EDIRSI, a Nubian geographer who visited the court of Sid Râd Jye Singh, the ruler of Ahalwara Puttan, A.D. 1094 to 1145. Edrisi states that Jye Singh was then a Buddhist. Edrisi lived A.D. 1099-1186. He mentions porcelain, and the fine cotton fabrics of Coronamel, the pepper and cardamons of Malabar, the camphor of Sumatra, nutmegs, the lemons of Mansura (near the old course of the Indus, N.E. of Hyderabad), on the Mekran (Indus), the asafetida of Afghanistan, and cæbebs, as an import of Aden. He names the Konkani as the country of Saï, i.e. of the sag or tiger-jeer. Marsdon says that Edrisi is improperly called the Nubian geographer, that he dedicated his work to Roger, king of Sicily, in the middle of the 12th century, and that he describes the island of Al-Ramî; but the particulars so nearly correspond with those given by the Arabian traveller, as to show that the one account was borrowed from the other.—Marsdon's Sumatra, p. 4.

EDUCATION.

Education in the village schools of India is usually conducted in the vernacular of a house, or in the open air. School for which there are three sections are held under trees in Bengal, and children who are beginning to learn, write the letters of the alphabet in the dust. This is the old oriental custom, and is alluded to in John viii. 6, when Jesus stooped down, and with his finger wrote on the ground. A general mode in India of teaching writing, is to write with a pencil of soapstone on a wooden board, or on thick pasteboard stained black. The writing board in Sind, called a furaha, is a thin board made of hard fine-grained wood, stained red, black, green, or yellow. The ink contains no mineral substance, and is therefore easily washed off, the board being smeared with a thin layer of clay and water. When the pupil has become somewhat skilful in the management of his pen, he lays aside the board, and uses a papier-mâché material called daftari. It is made of several sheets of writing paper pasted together, strengthened with a composition of verdigris, and glossed with a material which is a finishing or coating made of steel, so that it may be washed when dirty (Burton's Scinde, p. 396). In the Peninsula of India, the ground, the writing-board, and the pasteboard are written upon, in the schools, but the ordinary material is the olay or dried palm-leaf, which is written on with an iron style. The education of the Brahmins of India in the vernacular of their district, has usually been conducted along with a knowledge of Sanskrit. Since the middle of the 19th century, many of them have acquired a knowledge of English. The lower caste Hindus have restricted their acquirements to the vernacular languages of their district. Numbers of them know English; very few know Sanskrit. The Mahomedan throughout India learn Arabic, Persian, and a small number know English. The Lubbâh Mahomedan has the Koran in the Tamil tongue. Some of the Tamil women have been learned, one was an authoress, and many of their girls are now being sent to school. On the 29th July 1859, the Bethune School for Native Girls was founded at Calcutta. The English East India Company resolved to introduce a national system of education in a despatch from the Board of Control 19th July, No. 49 of 1854. The most important feature in the despatch was the measure of grants-in-aid. It offered to all schools, already existing, or that might hereafter be established, provided they were found efficient, pecuniary aid to an amount in each case not exceeding the sums arising from local sources, subject to conditions that in no way interfered with the perfectly free action of the managers of such schools, and only requiring that they should be submitted to Government inspection, with a view to ensure the secular instruction therein furnished being of a satisfactory character. It in fact threw open the field of Indian education to any one who chose to cultivate it, offering on the part of the Government to bear half the expense. The missionaries, with few exceptions, received the proffered aid, submitting without a dissentient voice to the conditions imposed.
EEDGAH.

Up to that year, 1854, during the rule in India of the English East India Company, only small and local efforts had been made by the state to educate the people, and even these had languished. The college of Fort William, established during the Marquis Wellesley's administration, was again abolished in 1853. But in 1881, Calcutta, Madras, and Bombay cities each had a university, with professors, and granting degrees in arts, medicine, law, and civil engineering. In the ten years 1872 to 1881, there had been 56,547 candidates for matriculation, of whom 21,182 had passed.

In 1881 there were 79,953 institutions for youths, and 2,590 for girls, with 2,195,614 scholars, of whom 120,365 were females. At the B.A. examination at Calcutta University in 1888, for the first time in the history of that body, two young Bengali ladies appeared as candidates, and were declared to have passed. The two girls graduates are named Chandramukhi Bose and Kadambini Bose. They were educated at the Bethune School in this city. The receipts in 1881 were Rs. 1,65,91,016, and expenditure Rs. 1,75,95,329. In 1882, during the Earl of Ripon's administration, Dr. W. W. Hunter was placed at the head of a commission to investigate the position of the Indian Government towards the people, in connection with the questions of high education and primary education.

During Hindu and Mahomedan supremacy, except in a few rare places, the education of their subjects was left to the benevolent efforts of learned men, who taught gratuitously such pupils as sought instruction; and this practice is continued to the present time. Since the arrival from Europe of Portuguese, Dutch, Danes, Italians, French, and British, their Christian missionaries of all sects have striven to spread education amongst the people, and there are Christian schools and colleges in which the English language is the medium of instruction, which compete successfully with the institutions established by the Indian Government.

Education in China is very general, and is largely encouraged by the state, but few women are educated. Children at six years of age are sent to school. The successful competitors for the literary degrees of M.A., B.A. and others are congratulated. Papers bearing Chinese characters are greatly venerated. See Han-lin.

EDWARDES, Sir HERBERT, K.C.B., K.O.S.I., born January 1820, died 1868, an officer of the Bengal army. He served under Sir Hugh Gough at Sobraon and Moodkee; served under Sir Henry Lawrence in the Panjub in 1848 and 1849. He subjugated the valley of Bunnu in 1848; and in May 1848 he defeated Murulj, aided in the settlement of Kashmir and establishing the authority of Gulab Singh, and aided in the rescue of the British prisoners at Multan. In the revolt and rebellion of 1857–58–59, he served in the Panjub along with Sir John (Lord) Lawrence, Generals Nicholson, Cotton, and Chamberlain. His views extended to ruling India as a Christian country, and his purse and pen were ever ready to aid in extending Christianity. The Indian Council decreed a monument to his memory.

EDWARDSIA HYDASPICA, E. madraspatana, and E. mollis are shrubs of the natural order Fabaceae. It is doubtful whether these be different species. The flowers of E. mollis are pretty, and is supposed to be the second kind of argawhan (see Bantuha variegata) mentioned by Baber (or his translator) as growing at Baber's tomb at Kâbul. It grows in the Panjub and on the Sutlujan range, up to 8000 feet. Run, Rohen, and Malan are the Pushtu names for E. hydaspica.—Dr. J. L. Stewart.

EDYE, JOHN, wrote on the Native Vessels of India, Ceylon, Malabar, and Coromandel coasts, Lond.; also on the Timber Trees of Ceylon and Malabar, As. Trans. I. 1–15; and a Description of Seaports on the Malabar Coast. Ibid. ii. 324. By a residence of five years in India, as His Majesty's master shipwright in Ceylon, he had singular opportunities of becoming perfectly informed on the subjects of which he treats in his memoirs. He describes in a clear and concise manner the various vessels of the coasts of Coromandel and Ceylon. He was afterwards employed in the department of the surveyor of the navy.

—J. R. As. Soc., No. i. of 1834, pp. 1 to 14.

EED, ARAH. There are five eed or religious festivals held annually by Mahomedans. The two principal are the Ramzan or Eed-ul-Fitr, and the Bakr-eed, which are farz and sunnum, i.e. commanded both by God and Mahomed to be observed. The other three are, Muharram, Akhri-char-sham-bah, and Shab-i-Burat, and are only sunnum, or commanded by Mahomed. The Eed-ul-Fitr, or Ramzan-ki-Eed, is held on the first day of the tenth month, Shawal, on which Mahomedans put on new clothes, make congratulatory visits, and make charitable offerings, farz or sadka. All of them move in procession to the Eedghah, where the khutbah is read. The Eed-ul-Fitr means the festival of breaking the fast, and follows the Lent of the Ramzan. The Bakr-eed is also called Eed-i-az-ha or Eed-ul-Kurban, the festival of sacrifices, and is held on the tenth day of the month Zil-haj.

EEDEE are holiday presents, given in Mahomedan schools at the several festivals by masters, who receive a small gift from each scholar in return, at the festivals of the Kurban, Shab-i-Burat, and Ramzan. They are sometimes a verse relating to the eed (or feast), written on coloured or illuminated paper. The custom is followed in Hindu schools at the festivals of the Holi, Basant panchami, and other similar religious festivals.

EEDGAH, a place of festival or of prayer; a building raised by Mahomedans of India, generally without the walls of a town, often amidst gardens. It is erected on a platform or a pediment three or four feet above the level of the ground, and on an eminence, consisting of a straight wall with two or more minarets, and having in the centre, on a level with the ground, three steps, which forms the minbar (or pulpit), from which the khutbah (or sermon) is read on particular occasions, or on particular feast days, such as those of Bakr-eed and Ramzan-ki-Eed, which occupies from an hour and a half to two hours. It is said that Mahomed, in addressing the congregation, stood on the uppermost step; Abu Bakr, his successor, on the second; Omar, on the third or lowest; but Osman, observing that at this rate we might descend to the bowels of the earth, fixed upon the middle as the one from which to deliver the sermon; since then it has continued so. This building is merely intended as a signal post for people to assemble at, to hear the khutbah read. A bamboo or any other post might answer the same purpose,
but a brick building is usually preferred, as being more durable, and affording individuals an opportunity of handing down their names to posterity, by being at the expense of erecting them. It is by no means a sacred edifice.—Herk.

EEITA-AKU. Tet. The leaf of Elata sylvestris; Eeita khallu, the toddy; Eeita pandu, the fruit.

EEK, also Eekh. HIND. Saccharum violaceum. Sugar-cane, a sugar-cane field. Eek'hraaj, also Ook'hraaj, is the day on which sugar-cane is planted, and which, in Northern India, is performed with some rural ceremonies.—Elliott.

EEE-GYWOT-SHA, a bast of Arakan; strips five to six feet in length, composed of several layers, of which one side is smooth and compact, and the layers on the other side thin but cancellar; all having a considerable degree of toughness.

EEES or Isa. Arab. Jesus. Eesa-ul-Masih, Jesus the Christ. Hazrat-Eesa, the Lord Jesus.

EEESA-KHAIL, an Afghan clan whose country extends to within 30 miles of the province of Delhi Ismail Khan. It is a strong and mountainous strip of land. The mountains of the Eesa khail and Khusur rise so abruptly from the Indus, that for the access to this country on other sides, it might make successful resistance.—East India Papers, Cabool and Afghanistan, 1859, p. 22.

EEESAWITAI or Isawiyah, a sect of Mahomedans in N. Africa, who take their name as disciples of Sidi Mahomed-ibn-Isa, a Maghribi. They are known to Europeans as the dancing darwesses, of whom there are a number in Cairo, almost all of them Maghrabi Arabs of Northern Africa. Mahomed-ibn-Isa was a native of Moqinay in Morocco. His followers at Kairwan are guilty of fanatical self-torturing. A writer in the Times of 18th November 1859, describes a circle of musicians in the centre of a room, playing a slow monotonous tune on earthenware drums and tambourines, gradually increasing in cadence until most of the devotees commenced to bow their heads and shout a refrain, swaying to and fro in time to the music. Suddenly one after another threw off their clothes and shouted discordantly. A Tunisian soldier slashed his stomach with a sword; a second forced a long iron prong against his side, which another drove in with a mallet; and others pierced their cheeks with iron skewers and their shoulders with daggers. One crunched glass; a sheep was killed, and torn and eaten raw and bleeding.

EESHWRA. Sansk. From Eesh, to be grand, hence Eeshwara, the glorious; Eeshwari, feminine of Eeshwara.

EGERTON, Mr., a Bengal civil servant, who wrote an account of his journey through Spiti, London 1874. In 1877 he was appointed to be Lieutenant-Governor of the Panjabs, was created in 1875 a C.S.I., and in 1878 a C.I.E.

Eggs as food articles are in varied estimation in the East Indies. Hindus have a religious objection to eggs. Their sacred books class both fowls and eggs in the category of unclean things, and no strict Hindu will touch anything so unholy, on any possible pretext. With Mahomedans they are largely eaten, usually in the form of omelet. The Europeans in the East Indies adhere to the customs of their race. Eggs are used in worship by the women of the Kuchari, and in divinations by the Khassyrrane. Fowls' eggs are largely consumed by the Chinese couriers or postmen, who take them nearly raw; in China they are seldom boiled and eaten as in Europe.

Hatching of fowls' eggs and eggs of fishes is largely practised by several nations. Ducks' eggs are artificially hatched in China in large quantities, particularly in Chusan at Fa tee, and Poce-taihne and Nam-tong near Canton.

In Chusan, every spring, thousands of ducks' eggs are hatched by artificial heat. The establishment is situated in the valley on the north side of the city of Ting-hua. The hatching house is a kind of large shed, with mud walls, and thorp, in which it is hatched with straw. Along the ends and down one side of the building are a number of round straw baskets, well plastered with mud, to prevent them from taking fire. In the bottom of each basket there is a tile placed, or rather the tile forms the bottom of the basket; upon this the fire acts,—a small fireplace being below each basket. Upon the top of the basket there is a straw cover, which fits closely, and which is kept shut whilst the process is going on. In the centre of the shed are a number of large shelves placed one above another, upon which the eggs are laid at a certain stage of the process. When the eggs are brought, they are put into the baskets, the fire is lighted below them, and a uniform heat kept up, ranging from 95° to 102°; but they regulate the heat by their own feelings, and it will therefore vary considerably. In four or five days after the eggs have been subject to this temperature, they are taken carefully out, one by one, and a door in which a number of holes have been bored, nearly the size of the eggs; they are then held against these holes, and the Chinsmen look through them, and are able to tell whether they are good or not. If good, they are taken back, and replaced in their former quarters; if bad, they are of course excluded. In nine or ten days after this, that is, about fourteen days from the commencement, the eggs are taken from the baskets, and spread out on the shelves. Here no fire heat is applied, but they are covered over with cotton and a kind of blanket, under which they remain about fourteen days more, when the young ducks burst their shells, and the shed teems with life. These shelves are large, and capable of holding many thousands of eggs; and when the hatching takes place, the sight is not a little curious. The natives who rear the young ducks in the surrounding country know exactly the day when they will be ready for removal, and in two days after the shell is burst the whole of the little creatures are sold, and conveyed to their new quarters.

In the East, during the hot summer months, some of the pond fish estivate in the mud, where they await the advent of the succeeding year's rains. As soon as the monsoon bursts, the ground becomes saturated, and fish are perceived dispersing in all directions. In a very few days fry are also discovered in every little piece of water, while the time which elapses between the commencement of the rains and the appearance of the little fish does
EGYPT.

and third, the dominions under native Egypt include the provinces of the country from the Sambulir salt lake in Rajputana, which overflows during the rains, and when the waters subside, a deep inerustation of salt is deposited on its shores for several miles around. In the water of the lake is a peculiar form of crustacea, said to be Artemia salina. These are about half an inch in length, are provided with numerous feet, while between the body and tail there exists a small sac full of eggs. These vary in colour from a pale fawn to a brilliant crimson; and as the brine approaches saturation they die off, but before dying they deposit their eggs, which are carried by the water to the edge of the lake, where immense layers, upwards of an inch in thickness, are found. These layers of eggs are subjected to the intense heat of the hot season, and are hatched at the commencement of the annual rains. — F. Day.

EGG-SHELL CHINA, a manufacture in Japan, in the provinces of Fozen and Setsamua.

EGRET, the common name of several species of the Cullrostres tribe and family Ardeidae of birds,—Herodias alta, H. egrettoides, H. garzetta, Demi-egretta asha, Buphous coronandus, and others. In Australia, what, in India, are called white paddy-birds, and in Britain are the much-prized egrets, have come to be denominated cranes; and the real crane of that country is known as the native companion. See Birds.

EGYPT, in the highway from Europe to the East, is ruled by the Khedive, a hereditary viceroy under the emperor of Turkey. The Egyptian dominions are equal in extent to Russia in Europe; its population, 53 millions. But Egypt proper, the Balad-ul-Misr (the Misraim of the Bible), though 550 miles in length, is, as distinguished from the surrounding deserts, the narrowest country in the world. The area of its cultivable tract, which has remained unaltered since the remotest antiquity, is about 11,342 square miles, the Delta measuring about 6550 square miles; and the Egyptian valley of the Nile and the Taghum, 4992 square miles. The Nubian portion of the valley of the Nile, 980 miles in length, does not exceed 1050 square miles of cultivable area. Lower and Upper Egypt are arranged into seven provinces (Mudiriyeh), the Fayum forming a county by itself. The seaports on the Red Sea are under a Governor General, Khedive: and the Sudan have sometimes had one or two separate Governors-General, and Gordon Pasha for a few years ruled in the Sudan. The total amount of land under cultivation, roughly speaking, is 5,000,000 feddans, the feddan being equal to three-quarters of an acre. Of these, 1,000,000, or one-fifth, belong to the Khedive; one-tenth, or 500,000 feddans, are held by other large landed proprietors; while the remaining seven-tenths are in the hands of the fellaheen,—these latter being subjected to taxation varying in amount from thirty to seventy shillings per feddan.

Egypt has been much resorted to by Asians and Europeans from the most ancient times, but it is only since the middle of the 19th century that its more ancient history has been traced. The skulls of the mummies prove that Egypt has been peopled with a variety of tribes; and physiologists have divided them into three classes,—first, the Egyptian proper, whose skull is shaped like the heads of the ancient Theban statues and the modern Nubians; second, a race of men more like the Europeans, and these mummies become more common as we approach the Delta; third, is an Arab race, and is like the heads of the labourers in the pictures.

Egyptian chronology now runs back to B.C. 5004 according to Mariette, and to B.C. 3892 according to Lepsius; and the earliest monuments which belong to the close of the third dynasty are therefore more than 6000 years old by one calculation, and more than 5000 by the other. The ancient Egyptians excelled in making glass, linen, and in dyeing, and they had a knowledge of metallurgy.

In the 19th century A.D., Count de Lesseps successfully completed a canal from the Red Sea to the Mediterranean.

Three times during the 19th century the British have invaded Egypt, but since Cambyses, son of Cyrus, king of the Medes, led his hordes of Persians and Phoenicians against the last of the Pharaohs, and reduced him to the position of a Persian satrap, Egypt has been subject to alien races. The first invasion of which we have exact details, and the most successful with the least materials, was that of Amru, general of the Khalif Omar, 639 A.D., which won Egypt from the Greek empire for the Mahomedans. Amru entered Egypt from Syria in the month of December with 4000 men. The reduction of Pelusium fortress, close to the present Port Said, took him a month. He then marched straight upon Memphis, but was kept for seven months before Babylon, near the modern Cairo, notwithstanding that the nation rose in his favour, detesting its Greek rulers. But when, at length, in August, partly through treachery, Babylon surrendered, the country was practically won. The Greeks, though defeated in a pitched battle, after twenty days' fighting, made good their retreat to Alexandria. Alexandria held out for fourteen months, and only in December 641 the garrison finally abandoned Egypt to the Mahomedans. Many efforts for its recovery were made by Christians, the most strenuous and most disastrous being that under Louis ix. in 1250. He arrived at Damietta on 5th June with 700 knights, out of 2000 with whom he had started from Cyprus, representing probably a force of some 7000 men. The next day he defeated the Saracen, and took possession of the town. Here he wasted his time till the 6th of December, when he moved on to Mansurah, where he stayed two months more. On the 6th of February he attacked the enemy, now strongly reinforced, was hopelessly defeated, and taken prisoner with his whole army, being only ransomed by the surrender of Alexandria, and the total evacuation of Egypt.

Napoleon Bonaparte reached Alexandria with some 30,000 men on the 1st of July 1798. Next day he was in possession of the town. On the 13th he fought a bloody battle at Ramaniach with the Mameluks. On the 21st he became master of the country by the total defeat of Muray Bay, with 6000 horsemen and 20,000 foot, in the battle of the Pyramids. On the 29th he entered Cairo.

1082
When Nelson arrived on 1st August at Alexandria, notwithstanding his total destruction of the French fleet in Aboukir Bay, he could not shake the position of Napoleon, now firmly planted in possession of the country. A year afterwards, notwithstanding his loss at Acre, on the 11th of July, Napoleon totally defeated the Turks at Aboukir. Repeated British bombardments of Alexandria had no effect, and on the 2d of March 1801, Abercromby, with 17,000 men, cast anchor in Aboukir Bay. On the 8th he effected a landing, and on the 21st he won the battle of Alexandria against 27,000 French, and lost his own life. Rosseta was taken, but the British troops hesitated to advance for two months. At length, in May, when some paltry reinforcements had arrived, they moved onwards, and again defeated the enemy, and took Ramania on the 7th, and Cairo capitulated on the 20th.

Meanwhile General Baird had started from Bombay in the end of December 1800, but only arrived at Kossir, on the coast of Upper Egypt, on the 8th of June. In nine days, with a force of 6400 British and native troops, he traversed 140 miles of desert to the Nile, and reached Cairo on 10th August with hardly any loss. The united force then marched down on Alexandria, and on 31st August Menon capitulated, and the whole French army evacuated Egypt.

The next British expedition to Egypt was in 1807. The Turks had declared war, and in March a force of 5000 men was despatched under General Fraser to Egypt. They arrived off Alexandria on the 15th, landed on the 18th, and took it on the 21st. On the 22d a fruitless attempt with a small force was made on Rosetta.

Next month, General Stewart besieged Rosetta for thirteen days, and on 22d April he fought his way back to Alexandria, with a loss of 1000 out of 2500. On 23d September Alexandria was surrendered to the Turks, and Egypt evacuated. As on this occasion the Mameluks and the country were in our favour, the failure can only be attributed to the want of vigour in the attack.

In 1822 the British for the third time invaded Egypt. Their army disembarked at Alexandria, and occupied the line of the Suez Canal, and a contingent of British and Native Indian soldiers from the armies of India embarked at Bombay for Suez, and Ismailia and Alexandria were the headquarters. The Egyptian army was checked by General Wolseley at Kassassin; utterly defeated, on the 13th September 1822, at Tel-ul-Kabir; Cairo was occupied by the British and Indian troops on the 14th, and Egypt won. The army and leading civilians had combined against the Khedive, because all posts of value were being given to foreigners.

Some of the numbers were—Germans, 41, with salaries amounting (monthly) to £E18; Americans, 8, £E508; Englishmen, 174, £E678; other British subjects, 94, £E1208; Austrians, 101, £E2369; Belgians, 12, £E32; Dane, 1, £E96; Spaniards, 12, £E252; French, 326, £E908; Greeks, 115, £E1469; Dutch, 9, £E340; Italians, 348, £E5011; Norwegians, 2, £E106; Roumanians, 3, £E34; Russians, 5, £E341; Swedes, 1, £E96; Swiss, 14, £E210; European policemen, 59, £E368;—total, 1325 persons, with monthly salaries amounting in the aggregate to £E31,588. This list comprises both the administrations which exist in virtue of special conventions, such as the Public Debt Department, Domains, Daira, Sanieh, and international courts, and also the State Administrations properly so called. The latter employ 970 foreigners. Altogether, 3,114,241 piastres per month, equal to £E373,704 a year, were spent in salaries to foreign officials, or £264,000 a year, if the Domains, Dairas, and international courts are excluded.

The population of Egypt proper is 5,250,000, or about 463 to the square mile. The total population under the sway of the Khedive is between 16 and 17 millions.

**Fellaheen** (peasants) form the bulk of the population of Egypt proper. They are Mahomedans.

**Copts** amount to about 300,000. They are mostly dwellers in towns. They profess Christianity.

Turks in Egypt form an aristocracy. They number barely 100,000 souls, and are supposed to be diminishing.

In 1822 Egypt sent to India merchandise to the value of Rs. 4,81,964, and took Rs. 1,68,42,831 of Indian produce. The E. coast of Africa sent to the value of Rs. 30,51,623, and received Rs. 23,54,896 of Indian produce, and Rs. 22,95,396 of re-exported foreign goods.

**EGYPTIAN BEAN,** a name sometimes given to the bean fruits of Nelumbium speciosum, *Wild.,* from the notion that they were the beans which the disciples of Pythagoras were forbidden to eat.

**EHRAHIM** or Iram, Arab., meaning any sacred or holy thing or place. It is applied in Egypt to the peculiar dress worn by pilgrims during the performance of the required ceremonies in Mecca, and until the completion of the pilgrimage. It consists of two pieces of cotton or linen or woollen cloth without seam or ornament, one of which is wrapped round the loins, and the other thrown over the shoulders. The instep and heel of each foot and the head must be bare; but umbrellas are now used by many of the pilgrims.

**EHRETIA,** a genus of shrubs of the natural order Boraginaceae. *E. aspera* and *E. buxifolia,* small trees of the south of India; *E. internodia,* a tree of the Mauritius; *E. levis* and *E. serrata,* trees all over India; *E. arenaria,* *Griphi,* is one of the sand-binding plants of the Indian coasts; *E. Wallichiana,* *H. f. et Th.,* grows in the Darjiling hills. The root of *E. buxifolia* (Kuruvivi vagy, *Tam.,* Pale ke jar, *Hind.)* is given in decoction as an alterative in syphilitic cachexia, and its fruit is eaten. Wight gives Ehretia aspera, cuneata, levis, ovalifolia, umbellata, viminea, Wightiana.

**EHRETIA ARENARIA,** *Griphio,* found between 12° and 28° N. lat.; binds together loose sand in a minor degree. It may be the same as *Ehretia Cuneata.*

**Wight Icon. iv. t. 1385, which grows on sands banks in the beds of all our rivers.**

—Cleghorn. See Sand-binding Plants.

**EHRETIA ASPERA.** *Robz.* A small tree of the Panjap plains, Siwalik Hills, and Salt Range. In times of dearth, its bark is said to be ground, mixed with flour, and eaten. Its wood is valued for its hardness.—*J. L. Stewart.*

**EHRETIA BUXIFOLIA.** *E. Cordiaretusa,* *Vahl.*

—Visser-pallam maram. *Dravid.*

—Bapana-buvi.

A shrub of the Peninsula of India, and abundant in the hot, drier parts of Ceylon. Fruit eaten by the poor; some part of the plant taken internally in a cathartic state of the body.—Thce.
EL. 

EHRETIA LEVIS. R. Beurrieria levis, G. Don.

Peda pulinera, Circars. [Secrada, ... Tel. Paldantam, God., Tel.]

A pretty large tree, common in the drier parts of Ceylon, and in the Peninsula of India; is a native of the Cercar mountains; grows in Hindustan, in the Dehra Doon, Kamaon, Kheeere pani, and in Bengal. It furnishes a hard, valuable small wood, which in the Circars is used by the hill people for many purposes; might be used in turnery.—Ainslie; Thur.; Cleghorn; Beddome.

EHRETIA OVALIFOLIA. W. I.

Gundan, ... Mahi. Naraga maram, ... Tam.

In the Coimbatore district, a common but generally small tree, and found about towns on the Bombay side, never in forests. The wood is said to be of no account.—Wight; Gibson.

EHRETIA SERRATA. Rozb.

E. pyrifolia, D. Don. Nulishma, ... Nip. Kala aja, Ben. Puna, ... Purhu.

A small tree growing in Bengal, Chittagong, the Khassya mountains, Napal, Bhutan, Kamaon, and the Dehra Doon. It furnishes a tough, light wood, easily worked and durable, made into sword handles.—Rozb.

ELAK. Turk. The term given by the pastoral Daurani to their summer residence,—Kishlak, also Turki, being that of their winter station.

EIMLIEE, a subdivision of the Tuga tribe dwelling in Husumpur, Dhubari, Dlaka, and Oojhari, in the zillah of Muradabad; many of these are Mahomedans.—Elliot.

EIN-SHE-MEN. Bum. Lord of the Eastern House; the distinctive appellation of the declared heir to the Burmese throne.

EIN WIN. Bum. A tree of Moulinne, used for all ordinary purposes of building.—Cat. Cat.

E-JIN or Ee- gin of Malaca, a grain from, seemingly, one of the Leguminosae. In 100 parts,—moisture, 12-90; nitrogenous matter, 29-06; starchy matter, 59-40; fatty or oily matter, 0-89; mineral constituents (seh), 4-05.

EJOO or Ejaa, also Gomuti, a strong black horsehair-looking fibre obtained from the Arenga saccharifera tree. This fibre is much esteemed for making rope, especially cables, for which purpose it is peculiarly adapted, from not being liable to injury if stowed away below when wet with salt water.

EK. Hind., Pers. One. It enters into many compound words, as Eka, Sansk., chief. Ekatasha, also Ek-bara, in distillation, the spirit once passed over. When re-distilled it is called Dotatsha or Do-bara, double-distilled; Shiva-atasha, or thrice distilled.

Ekachhatra, also Chhatrapati, a vaulted horizontal umbrella, always reserved exclusively for royalty. It is the source of the word Satrap.

Ek-fardi, also Ek-faali, land yielding one crop annually.

Ekhartha, a one-wheel well. A domals or dolah well has two wheels.

Ekha or Yaka, a slight carriage drawn by one horse.

Eksutti, coarse, thin, single-thread cotton cloth, Eka-chakra, the modern Arrah. The Pandavas dwelt in it for a short time during their exile.

Eka-danta or Eka-danshtra, from Eka, one, and Danta, a tooth, a name of the Hindu god Ganesh.

Eka-dashi, literally one and ten, the 11th day of the moon's increase or decrease. It is one of the Hindu fast days, or Bart.

Eka-dasi vrata, fasting on the 11th lunation.

EKALBIR. Hind. Datisicus cannabinus. Its root is a dyestuff; also Verbasum thapsaee.

EKAMRA or Ekamra Kanana, a forest in Oriessa (Utikala), which was the favourite resort of Siva, and became the great seat of his worship, at the city of Bhuvaneswara.—Dowson.

EKLINGA, a celebrated Saiva temple in the defiles of the Vindhya. The most antique temples are to be seen in such spots, within the dark gorge of the mountain, or on its rugged summit, in the depths of the forest, and at the sources of streams, where sites of seclusion, beauty, and sublimity alternately exalt the mind's devotion. In these regions the image of creative power appears to have been the earliest, and at one time the sole object of adoration, whose symbols, the serpent-wreathed phallus (lingam) and its companion the bull, were held sacred even by the children of the forest. In these silent retreats the Mahadeva long continued to rule triumphant. The temple of Eklinga, ascribed in one of the narrow defiles leading to the capital, is an immense structure, though more sumptuous than elegant, it is built entirely of white marble, most elaborately carved and embellished. The brazen bull, placed under his own dome, facing the sanctuary of the phallus, is nearly of the natural size, in a recumbent posture. It is cast (hollow), of good shape, highly polished and without flaw, except where the hammer of the Mahomedan had opened a passage in the hollow flank in search of treasure. Amongst the many temples where the brazen calf forms part of the establishment of Bal-Cesar, there is one sacred to Nanda alone, at Naen, in the valley. This lordly bull has his shrine attended as devoutly as was that of Apis at Memphis, nor will Eklinga yield to his brother Serapis. The changes of position of the Apis at Naen are received with indignity, as the fruitfulness of the seasons, though it is not apparent how such are contrived.

The physiological worship of the god Siva, with his emblem the lingam, priapus, or phallus, and his vahan, the bull Nandi or Basava, seems to have entered India on its western border. But it is now very general, and Nandi, in stone or brass, is to be seen everywhere; perhaps half a million of them are in India, generally couching, looking to the lingam.

EKOJI, the first of the Maharra rulers of Tanjore. He was the son of Shah-ji (A.D. 1644), a subahdar of the Kurnatic under Aurangzeb, who gave Tanjore to Ekoji as a jaghir. The last of the Tanjore rulers died in 1855, and the country was annexed to British territory.

EKSHA MAIL, a Nepal ruler, who in A.D. 1600 divided Patam, Khatmandu, Banepa, and Bhagatang between his daughter and his three sons. His full name was Jaya Eksha Mail, also written Jye-Kush Mail.

El, the Arab-Egyptian pronunciation of the article Al, answering to 'the.'

EL. Heb. The strong. Many Jewish names are compounded with this name of God, as Daniel, Ezekiel, Gamaliel, Urieil, Elion, the highest. Several nations, in addition to the Hebrews, used this name, in one or other mode, as relating to the Supreme Being. El, also named Kronos of the Egyptians, according
to the doctrine of Byblus, was the son of heaven and earth. He conspired against his father Ouanos. El is the root of Elohim. Bethel of Genesis xxviii. 19 is a compound word,—Baith-El, the house of El, meaning God's house. El of the Greeks (Yl in Hebrew and Phoenician), i.e. God, the strong; whence comes Elohim, literally, the gods, and the Greeko-Phoenician Betyla, or sacred stones supposed to have fallen down from heaven, perhaps aërolites, which were honoured and held sacred on account of the divine power supposed to be inherent in them. Jacob, as he rose from his dream, exclaiming (ver. 17), 'How holy is this place: this is none other but the house of God (Baith-El). ... And Jacob ... took the stone that he had made his pillow, and set it up for a pillar, and poured oil upon the top of it, and called the name of the place Beth-el.'—Huxely, iv. 242-3. See Betyla; Bait.

ELAGNACEAE. E. oleasters, a small natural order of plants, consisting of trees or shrubs whose leaves are either opposite or alternate. Several species of the genus Elagnus occur in the south and east of Asia. Thunberg enumerates eight in Japan. E. parviflorus, Royle, valuable as a hedge plant, grows from the Himalayas to China. E. hortensis and E. orientalis bear a brown fruit about the size of an olive, which is brought to market in Persia under the name of Zinzyed; in quality it is like a jujube. The red drupes of E. conferta, the large olive-shaped ones of E. arborea, and the pale orange-coloured ones of E. triflora, are eaten in India. The ripe berries of E. angustifolius are eaten in Kashmir, as also are those of E. dulcis, E. hortensis, and E. orientalis. E. Moorcroftii has ornamental flowers. The wood of E. conferta is the winter fuel of the people of Iskando; and the honey gathered by bees from the sweet flowers of E. orientalis is much esteemed. E. latifolia, Linn., is very common in Ceylon up to 5000 feet. It is very sweet and is the same species as conferta, and parviflora, Roxburgh, and the ferruginea, Kologa, Thwaitesii, and Wallachiana of Schlegel.—Mueller; Stewart; Roxb.; Wight; Hooker; The.

ELAGNUS ORIENTALIS. Sanjit, Sanjad. ... Pers. ... Sanzilloh, ... Pers. ... Zindul. ... Pers.

Grows along the banks of watercourses in Afghanistan and Persia. The trees are remarkable for their silvery lepidote and aromatic foliage. The fruit is eaten fresh, or boiled with rice, like the apricot. It sells at Peshawur several seers for a rupee.—MacGregor; Powell.

ELAIIS GUINEENSIS is the oil-plant, or Maba of the natives of Congo. It is common all along the west coast of Africa, and might with advantage be introduced into India. The fruits afford the important product palm-oil, of which upwards of 1,000,000 cwt. were imported in 1871. The oil is obtained by bruising the fleshy part of the fruit (and not the kernel, as sometimes stated), and subjecting the bruised paste to boiling water in wooden mortars; an oil of an orange-yellow colour separates, which concretes when cool to the consistency of butter, and has when fresh the smell of violets or of the root of Florentine iris, with a very slightly sweetish taste. The oil is used by the Africans in cookery and for anointing the body. In Europe it is chiefly employed in perfumery and medicine. The Elais occidentalis of Swartz, the thatch-tree of Brown's Jamaica, and the Avoira of Amblet, are probably all identical with the Maba or oil-palm, of the African coast.

ELAEOCARPACEAE. E of Lindley, an order of plants comprising species of Elaeocarpus, Ganitrus, and Monocera. Dr. Roxburgh describes E. aris-tatus, fruticosus, ganitrus, lanceaefolia, lucidus, robustus, rugosus, serratus, and tuberculatus; and E. cuneatus occurs in Malabar, Quilon, and Ceylon. In Japan are E. japonicus and photiniefolius. E. amennis, Thu., a very beautiful tree, is common in the central provinces of Ceylon up to 4000 feet, and is also cultivated in gardens. E. ferrugineus, Wight, the Monocera ferruginea, Wight, Icones, tab. 225, is a good-sized tree, very common on the Neelgierries, Animalayas, and Pulneys, at the higher elevations. The margins of the leaves are always convoluted, rendering the leaves quite boat-shaped. The timber is used for building purposes. Wight figures the ovary as four-ocell'd; but in several flowers that Colonel Beddome dissected it is three-ocell'd. E. lanceaefolius, Roxb., is a tree of the Darjiling Hills. E. venustus, Bedd., a fine large tree, only observed in the Muti Kulivayal, South Travancore, at 4500 feet elevation; in flower in August. It is truly beautiful when covered with its snow-white large flowers, which it produces in great abundance. E. robustus grows on the Khassya Hills. E. longifolius, Bl., is of Java and Burma. E. Indicus, R., and E. lucidus, R., are trees of Chittagong. E. montanus is a middle-sized tree of Ceylon. In Burma are several species, undetermined, which the Burmese name Taun-mang-ye, Than-lwen, and Wa-hso-ben.

Elaeocarpus ganitrus, Roxb. Ganitrus aphasis, Gurtin.

Utrasmum head tree, Eng. ... Radura-kai. ... Tam. ... Radourasha. ... Sansk. ... Radura-chali. ... Tel.

A tree of Java. The seeds, about the size of marbles, are worn as necklaces by Brahmans and ascetics; they are commonly called Utrasmum heads. Elaeocarpus hisnus, the binau of New Zealand, is a large timber tree. Its berry is edible, though taste harsh.

Elaeocarpus lanceaefolius, R. Ootaradique manke, Dukh. ... Utrasmum? ... Tam. ... A tree of the Khassya Hills, Assam, Moulinme, and Java. The seeds are very rough, and about the size of small nutmegs. Saiva Brahmas and Pundurums, religious devotees of the Saiva sect of Hindus, who live by alms, wear strings of them round their heads and necks, and form them into rosaries. This small tree is covered over with a profusion of white flowers.—Mason; Ain.; Roxb.

Elaeocarpus oblongus, Gurtin., Kassow, Dukh., is a handsome tree of the Dekkan; flowers in May, petals beautifully fringed; the foliage is frequently tinged with red, giving an autumnal appearance to the tree. Elaeocarpus tobovatus, Ainicie, E. coriacus, Hook. This tree grows at Newera Ellis and other elevated parts of the island of Ceylon, at an elevation of from 6000 to 8000 feet.—The.

ELAECARPACEAE. Elaeocarpus tuberculatus, Roxb.

Monocera tuberculata, ... E. serratus, Roxb. ... W. Jc. ... E. bilocularis, Roxb.

Radura-kai, Radurach, Tam. ... Raduracha, Raduracha, Tel.

This truly magnificent tree is very common in Coorg, the Animalayas, Malabar, and Travancore, up to an elevation of about 4000 feet. Very large trees of it may be seen about the foot of the Neelghierries and Makurty Peak; and the seeds
are worn as ornaments, also as rosaries by Vaishnava Brahmanas and by fakirs.—Mr. Rohde, MSS.; Royce; Thuc.; Riddell; Ward, p. 371; Beddome, Fl. Sylv. part x. p. 113.

ELBOCOCA VERRUCOSA. Ad Juss. Dryandra cordata, Thunb. | D. oleifera, Lam. The Ying-tze-tung or Yu-tung of the Chinese, is a tree of China and Japan and the Mauritius. It grows plentifully in the valley of the Yang-tze river. Its seeds or nuts furnish the wood-oil (tung-tse-yu) of Chinese commerce. The fruits are very acrid.—Hogg, p. 461; Smith.

ELBODENDRON, a genus of plants belonging to the Celastrina, growing in Ceylon, Berar, Garhwal, Darjiling Teral, and Burma. The wood of E. Roxburghii weighs about 55 lbs. the cubic foot.

ELBODENDRON INTEGRIFOLIA. M Cl. Hsoak and Jouk-bin, Burma. This is a very plentiful, strong, fine timber tree found throughout the forests of L. Tounghoo and Pegu districts, as well as about Rangoon. It is adapted for fancy work and cabinetmaking.—Dr. M'Clelland.

ELBODENDRON PEIRSICUM, a tree of Burma. Its leaves form the principal ingredient in the hla-pet or pickled teak.—Imp. Gaz.

ELBODENDRON ROXBURGHII. W. and A. Neerija dichotoma, Roxb. | E. glaucaum, Wall. Bleed, paniculatum, W. A. Tamrooj, ... Can., Mahr. Irukuli, ... Tam. Merandu, Padraam, Panj. Karkava, ... Jamos, ... | Nirija, Neradi, ... Tel.

This tree is not uncommon in the eastern part of the Siwalik tract E. of the Ravi. It is found in Garhwal, throughout the Madras Presidencies, Bombay, Bengal, and it is very variable. In the dry Sermoon the site of the city of Elam, its wood is found of immense girth; and in the moist forests of the Animallays, at 2000 feet elevation, it is a very large tree. Again, in the Combatore plains it is met with as only a shrub, with sharply serrated leaves, but differing in no other way. The wood is not very strong or stiff, but is tough, close, and even-grained, and the surface beautifully curlcd and flowered, and of a reddish-brown colour, and suited for cabinet work; it is used by the natives for the manufacture of combe, etc., and is suited for picture frames, etc. A cubic foot unseasoned weights 60 to 65 pounds, and 46 pounds when seasoned; and its specific gravity is 736. The root and bark are used medicinally by the natives.—Dr. J. L. Stewart; Drs. Wight and Gibson; F. r. Mueller; Beddome, Fl. Sylv.

EL AJAM. Ajam, in Arabic, literally means foreign; but in the southern parts of Arabia, El Ajam is applied to the opposite parts of the coast of Africa.

ELAKOLA or Yelakola. M ALEAL. A form of accounting in which words are used in place of figures; each syllable has a numerical value, and the whole is read backwards.

ELAM or Susiana was the country on the east of the southern portion of the Tigris, south of the Luristan mountains, and was the cradle of ancient sovereignty. Berosus mentions a legend to the effect that the first dawn of civilisation was there, and that the teachers of mankind came from the shores of the Persian Gulf. Susiana was known as Elam, and all the Babylonian and Assyrian dynastic arrow - headed inscriptions, hitherto deciphered, refer to Susiana as the cradle of sovereignty, where the ruins of great cities were discovered by Sir H. Rawlinson. The Elamites were a powerful nation in the early days of Abraham, before either the Assyrian or Babylonian governments rose into power. Chedoraemon, king of Elam, held Cauna and Arabia Petrea in subjection.—Bunche, iii. 352. See Iran; Jud.

ELABAM. Tel. Its Sanskrit name is Sahakara, a fragrant kind of mango; hence the name from Ela, cardamom, fragrant.

ELAND, an antelope of Africa, the Oreas canna. In shape and general aspect it resembles a Gujerat ox, not unfrequently attaining the height of 19 hands at the withers, and weighing from 1500 to 2000 pounds. It might be introduced into India. It breeds readily in confinement.

ELANUS MELANOPTERUS, the black-winged falcon or claret, is a pretty little hawk of Asia, Africa, and S. E. Europe.—Jardine.

ELAPRUS DAVIDIANUS, Smith. Su-puh-siang, ... Chin. | Chau; T'lu-huh, ... Chin.

This is found in the eastern part of Manchuria, the S.W. of Koko-Nor, the district of Tarbagatay on the frontiers of Ili, and the northern parts of Sze-chuen province. The tail is used by the Taoist monks as a fan.

ELAPIDE,E, a family of venomous colubrine snakes. See Reptiles.

EL ARAM, mentioned in the Koran as the Sail-ul-Aram, or Flood of ul-Aram, is the dam of Mareb, built by Queen Balkis above the city of Saba. It burst a.d. 120. See Mareb.

ELARAMU. Tel. A root employed in tropicall affections, supposed to be that of Opbixylon serpentinum.

ELATER. See Firefly: Fulgora: Insects.

ELASTER NECTILCUS, one of the lantern flies. There are over 70 species of Elater in tropical America.

ELATERIUM, the Ku-kwa-chih of the Chinese.

ELATINACEE. Lindley. Water pepper tribe of plants, comprising two species of Bergia.

ELA-VANNIAR of Telingana, a caste of cloth merchants.

ELAYNE, a town of Nejid in Arabia, the birthplace of Mahomed-ibn-Abdul-Wahab. He founded the puritan Wahabi sect. He was born A.D. 1691. See Wahabi.

EL BAKIA, the companions of Mahomed, the Astuwannat-ul-Asbab, the column of companions, are buried at El-Bakia.—Barton's Mecca, iii. 396.

EL BEIT, a town founded by Tobia-ul-Akram (A.D. 90 - 140), grandson of Shammir Yeraesh. Shammir, in an invasion of China, perished with his army in the deserts of Tibet. Tobia, to revenge his grandfather's death, marched from Yemen, rebuilt Shammir, and according to Shammir, carried war into China, where he built El-Beit, in which he left a colony of 30,000 Arabs, who continued a distinct people when Hamadou wrote in A.D. 553. See Samarcand; Shammir; Yemen.

ELBURZ. The mountains of Elburz, at the foot of the southern slopes of which the town of Teheran is situated. They extend from the plains of Kazvin on the west, to the town of Demavoud.
EL-CHASAI.

ELEPHANT.

EL-CHASAI or Elkesais, called also Mugh tasilah, or washers, a sect found in the 1st century of the Christian era.

ELCHEE. PERS. An ambassador.

ELCHI, according to the maps Hitai, is the city known to older travellers as Khoten.

EL-DOZ. After the death, in A.D. 1205, of Mahomed of Gour, his kingdom was divided amongst his generals, and Kebul and Kandahar in Afghanistan fell to his slave El-Doz. He was, however, soon dismissed by a prince of Kharmas, whose successor, Jadal-Din, was compelled to yield to Chengi Khan.

ELECAMpane ROoT.

Elecampane root has an aromatic and slightly fetid odour. Formerly prescribed in dyspepsia, pulmonary complaints, and palp. — O'Sh.

ELECTRICITY is evolved abundantly in tropical Asia, at the beginning and close of the monsoon rains. The close of the S.W. monsoon is often attended with much electric disturbance. The N.W. storms at Calcutta are always attended with a great evolution of electricity. The art of sending information by means of electric currents passed along wires, was early perfected in India by Sir William O'Changhnesey, and all British India is communicat, and in connection with Europe and America. Electric lights are often seen in the swamps of India, and in storms on the masts and spars of ships at sea.

ELEMENTS. In the philosophy of the Hindus, as stated in the Puranas, the elements enumerated are the same as given by Empedocles and Pythagoras. The order of Empedocles was ether, fire, earth, water, air. Pythagoras arranged them into fire, air, water, earth, and ether. In the Hindu Puranas are ether (akas), air (ayu), fire (tejas), water, and earth. The Chinese name them earth, water, fire, metal, and wood, each denoting five innate essences, and the nature of each essence is indicated by its corresponding form of matter. The Chinese consider that health or sickness depends on the proportions in which the five elements are present in the body.

ELEMI. Lan-hiang, CHIN., occurs in yellow transparent masses, which readily soften by the heat of the hand, and have a strong aromatic odour, and a hot, spicy taste. It is a gum-resin, and is said to be the concrete resinous exudation from one or more genera of plants, Amyris, Balsamodendron, Canarium, Elphrium, and Icica. The Elphrium elemiferrum, Royce, yields Mexican elemi. Canarium commune, Lan. (synonym of Canarium zeyherinum, Rumph.), of the Spice Islands and Ceylon, also C. balsamiferum of Ceylon, are said to yield a resin which in odour and general appearance strongly resembles elemi. The resin called arbol-abrea at Manila, which somewhat resembles elemi, is considered by some to be the product of Canarium album, a Philippine tree. Brazilian or American elemi is, from the Icica Icicariba, Marcy, and the resin of Courina from I. ambrosica. It is abundantly produced from a Canarium in the forests of the Philippines, where it often assists in giving a cheerful blaze to the fire of the traveller. It is also exported from Manila as a drug. This gum-resin forms an essential ingredient in many of the finest varnishes. — Waterstone, Franklin; Clegh.

ELECHOARISTUBEROUS, or Scirpus tuberosus. A kind of arrowroot is prepared by the Chinese from its tubers.

ELEPHANT.

Heen, ... BUM. Hasthi, ... SANSK.

Fel, ... AR., PERS. Tel, ... TURK. 

Pil, Gaja, ... PUSHTU.

The source of the word elephant is doubtful. Sir J. E. Tennant supposes it to be the Hebrew Eleph, an ox, and Hindi, Indian. Pietet derives it from Airavata or Airavana, the elephant vahan of Indra, from Airavata, son of the ocean. Burton says (Pilgrim, i. p. 275) it is from Pilu, in Sanskrit, or, as we now have it in Pushtu, Pil, in Persian Fel, which in Old Persian becomes Fil, and, with the Arabic article, el-fil, turned to Elephas in Greek. Lassen thinks it may be from the Arabic al, and the Sanskrit Ihabanta. The elephant is mentioned but two or three times in the Big Veda, by the name Mrigo-losiit, the beast with a hand, and in such a way as to show that he was still an object of wonder and terror. In the Arthavara he occurs also, only rarely, under the name Hastin (the mirga now left off), and is exalted as the mightiest and most magnificent of animals. Nothing appears there to show that he had been reduced to the service of man. In the Syrian armies, anciently, the elephant seems to have been much employed. According to the Apocrypha (1 Maccabees vi. 33, 37), Antiochus, when warring against Judas Maccabaeus, had in his army elephants guided by Indian drivers, each
stated to have had on his back a strong wooden tower, containing thirty-two fighting men. But this would amount to about 2½ tons weight, quite beyond what any elephant could easily carry.

The African elephant is not now known to be tamed, but there is no doubt that the Carthaginians availed themselves of the services of this species. Also, on the stupas at Bharhut, at least 2000 years old, there is a representation of a captive untamed elephant being led off by monkeys.

The elephant is the largest of terrestrial mammals. Though the Sumatran has been considered to differ, there is, according to most authors, only one African and one Asiatic species. The Asiatic species, *E. indicus*, is found in Ceylon, in the southern and western parts of the Peninsula of India, in the forests at the feet of the Eastern Himalaya, in Nepal, in the sal forests, Tipemh, Chittagong, Burma, the Malay Peninsula, and the larger islands of the Eastern Archipelago. There are differences: the elephants of the same locality even vary in form and character. They attain their full height when 18 or 24 years of age, and range from 7 feet to 10 feet in height, up to the top of the shoulder. Twice round its forehead gives nearly the exact height of an elephant. Elephants of Ceylon do not average above 8 feet in height, and never exceed 9 feet; yet Wolfs says he saw one taken near Jaffna which measured 12 feet 1 inch, of course to the arch of the back. The Ceylon elephants are not so large as those of other parts of India. Mr. Corse says the greatest height ever measured by him was 10 feet 6 inches. He met this elephant belonging to the Nawab of Dacca, which was said to be 14 feet high. The driver assured him that the beast was from 15 to 18 feet, yet when carefully measured it did not exceed 10 feet. The skeleton of an elephant in the museum at St. Petersburg, which was sent to Peter the Great by the Shah of Persia, measures 10 feet 2 inches in height, and probably this is the tallest authentic instance on record. In Ceylon an elephant is measured at the shoulder, and 9 feet at this point is a very large animal. The African elephant is perhaps not inferior to that of Pegu. Major Denham, in his expedition into Central Africa, met with some which he guessed to be 16 feet high; but one which he saw killed, and which he characterized as 'an immense fellow,' measured 12 feet 6 to the back. The fossil remains of an elephant discovered at Jubulpur measured 15 feet to the shoulder.

In India they are classed according to their outer forms, viz. the Kumariah or princely, a strong-bodied animal; the Mirghi or deer-bodied; the Sontarhiah, or mixed breed between the Kumariah and Mirghi; and the Mirghabali, approaching the Mirghi. The Dantela is the tuskered elephant. The Munka has a head like that of the female, with comparatively small straight tusks. The elephant with nicely curved tusks is called the Polang (or bed) dant; and a one-tuskered elephant is the Ek-dant or Ganesh, after the Hindu god of wisdom, who is represented with the head of an elephant, and one tooth.

The Kumariah is the most valuable, and is marked for the smallness of its head, the stoutness of its body, and the hardness of its nose, lifting its foot no higher than is sufficient to clear intervening obstacles. The Mirghi has a large head, and long legs in comparison to the size of its body; its paws are high, and rather clumsy. The cross between the Kumariah and the Mirghi is called Nasl, and partakes of the qualities of both. The Munka is a tuskless male of either variety. They are large and strong animals, having been longer able to suck. Not more than one in three hundred has tusks; the others are merely provided with short grinders. Those with tusks are usually males.

Elephants are gregarious, averaging in a herd about eight, although they frequently form bodies of fifty and even eighty in one troop. Each herd consists of a very large proportion of females, and they are constantly met without a single bull in their number. Baker has seen some small herds formed exclusively of bulls, but this is very rare. The bull is much larger than the female, and is generally more savage. On each side of the elephant's temples is an aperture about the size of a pin's head, whence in the season of rut a secretion exudes, which is called mada or dama. Whilst it flows the elephant is called motta, and at other times nirmada. The odour of this fluid, frequently alluded to in Hindu poetry (see Wilson's Meghaduta, i. p. 132), is compared to that of the sweetest flowers, and is supposed to deceive and attract the bees.

White elephants, either lepers or albinos, possibly in both of these conditions, are occasionally found; and the kings of Burma and Siam take, as one of their titles, the appellation of Lord of the White Elephant. Indeed, the presence of a white elephant in Siam is considered as a palladium for the kingdom. The king of the Peninsular state, Patan, would not permit of the sight of a white elephant; while Crawford saw six in the king's stables. In Enaen, in eastern Central Africa, a white elephant is reverence. When Jaya Chandra of Benares and Kanouj was defeated and slain by Shahab-ul-Din, Mahomed Ghoir, in A.D. 1194, on the banks of the Jumna, between Chandwar and Etawa, a white elephant was captured; which is related to have refused to make obeisance to the sultan, and had almost killed its rider who endeavoured to force the animal to comply. In the time of Mahomed's grandfather, when Abrahah, the Christian king of Himyar, advanced against Kenanah in Hijaz, to revenge the pollution of the Christian church at Senna, he was seated on an elephant named Mahmoud, distinguished by its bulk and skin of pure white.

Elephants rarely breed in captivity. They are becoming scarce in S. India; and in 1868 the Madras Government began to preserve female elephants. They frequent hilly and mountainous districts. They are met with in Ceylon at heights of 7000 and 8000 feet, and in the south of India at about 4000 and 5000 feet. In the Ceylon forests they come forth to feed about 4 P.M., and they invariably retire to the thickest and most thorny jungle in the neighborhood of their feeding place by 7 A.M. In these impenetrable haunts, says Baker (Rifle, pp. 10, 11), they consider themselves secure from aggression. The period of gestation with an elephant is supposed to be twenty months or two years, and the time occupied in attaining full growth is about sixteen years. The whole period of life is supposed to be a hundred years, but Baker would increase that period by fifty.

These great mammals have been trained to take
part in theatrical representations. At present the elephant is usually employed for the transport of large tents and other articles of equipment, beyond the power, or of size inconvenient to be carried by camels or bullocks. Its load for steady work varies from about 15 to 20 cwt., exclusive of the pack or pack saddles. With this it travels at the rate of 5 miles an hour, and four from 16 to 20 miles per diem; but it can perform and bear longer marches for some time without injury. On an emergency, a riding elephant can travel at the rate of 5 miles an hour, and will go about 40 miles in a day; but for a continuance its performance will not much exceed that of the baggage elephant. In India there are elephant batteries of heavy artillery needed for sieges, and the nobles of the Dekhan Hyderabad use them largely for riding.

The Agadir swordsmen of the Hamram Arabs hamstrung the Abyssinian elephants with swords. The Abyssinsians still eat the flesh and that of hippopotami, as described by Strabo (lib. xvi. p. 772, and Diod. Sic. lib. p. 161).

In India, at the present day, the herds driven into the kraal or kheddah are sometimes very numerous. In January and February 18—? Mr. Sanderson captured 106 in the comparatively small forest tract near Dacca; and immediately afterwards, 28 more near the Garo Hills; and in 1879 (1st July) he captured 53 of an elephant in Mysoor.

The Ceylon elephants are found in all the uncultivated parts of the island, but their favourite haunts are near to the farms, to which they prove so destructive, that the colonial government paid 7s. 6d. for every tail of the animal which was brought to the authorities. Mr. Talbot paid £200 during one year for tails, which would give 600 as the number of elephants destroyed. One officer actually killed, during his residence on the island, no less than 600 of those gigantic animals. They are ordinaryst shot with a rifle. The sportman approaches his game in front, so that he may aim at either of the only two vital parts upon which a rifle ball will have any effect, one being directly in the forehead, through which the brain is penetrated, and the other behind the ear.

The catching and taming of elephants furnish a large source of revenue to the Nepal government. The Tharoos use a number of traps to catch elephants, such as 'the wild herd of 300 or 400 elephants, about 200 Tharoo collect together, mounted upon elephants, and accompanied by two large 'taking elephants,' highly fed, and thereby kept always must (sensual). The herd of wild elephants having been started, they get away trumpeting and whistling into the thickest part of the forest, hotly pursued by the mounted Tharoo, each of whom is provided with three or more nooses, called the moosack, which is made of very strong raw hide, well soaked in oil, and so ingeniously contrived, t hat when once attached to the elephant, the hind legs are gradually drawn together at every step it takes, until it is brought to a complete stand-still. The chase continues frequently for 20 miles at full speed, until in fact the wild herd becomes blown, and is brought to a stand. The danger then commences, for the wild ones dashing at their pursuers, in their turn causing the most intense excitement during half an hour, until the arrival of the two must elephants, whose bulk prevents their keeping up with the more active ones ridden by the Tharoo. These two elephants, each having three keepers upon their backs, dash into the herd. Their appearance, accompanied by the powerful nauseous odour emitted by must elephants, creates an immediate panic among the wild ones, and soon paralyses their efforts of resistance. The active little Tharoo now come down from their steeds, and, under cover of one of the must elephants, who pushes himself forcibly against the wild ones, selected from the herd, in a most dexterous and daring manner slip the moosack on to each of the hind legs, which performance occupies about three minutes. The noosed elephant is then allowed to depart, and he goes off evidently delighted; but as the moosack becomes contracted at every stride, he finds his intended flight brought to a close at a distance of sixty or seventy yards. After operating upon about fifty wild elephants in a similar manner, the Tharoos permit the remainder of the herd to abscond, and employ themselves in fastening the noosed elephants to separate trees, where they are detained from two to three weeks under the careful charge of the takers. If any of the captured show symptoms of violence, they are immediately punished most severely by two of the large tame elephants, who belabour themmercifully with their trunks. Two such thrashings effectually cure the most insubordinate, and at the expiration of six weeks the once free and independent denizen of the forest has a keeper on his back, and becomes as quiet as if he had been in a state of subject to all his life. The full-grown female elephants of Nepal seldom exceed 7½ feet in height, but the males of forty years old, at which age they are considered to be full grown, average from 9 to 11 feet.

Elephants are captured in Siam by loosing female elephants in the forests at certain seasons, when the wild males return with them, and are captured.

In Ceylon, the Peninnauls of India, Cachar, and Assam, the capture of herds is effected by driving them into a kraal or kheddah. In Travancore, the state and private persons have about a thousand pits as elephant traps. The pits are 8 feet square, rounded off towards the bottom, from which, with the aid of tamed elephants, the animal is raised and tamed. The tamed elephant is guided by the ankus (Ankasa, Sansk.; Arpe, Greek; Cuspis, Latin; Ihndoo, Singh.), a goad and guiding rod, in shape resembling a small boat-hook. It is figured in the medals of Caracalla of the identical form in use at the present day in India.

In August 1880, Mr. Sanderson delivered before the Viceroy at Simla, a lecture on the elephant. Out of many hundreds which Mr. Sanderson had measured in the south of India and Bengal, he had only found one male of 9 feet 10 inches vertical height at the shoulder, though the raja of Nahum had a tusker which measures 10 feet 6½ inches. Few female elephants attain 9 feet at the shoulder. A dead elephant, one that has died a natural death, is so rarely if ever seen, as to have given rise to the belief among some wild tribes, that wild elephants never die; whilst others believe that there is a place unseen by human eye, to which they retire to end their days. Mr. Sanderson had never seen the remains of an elephant that
had died a natural death, and had never met any one among the jungle tribes or professional hunters who had. The Singhalese have a superstition that on feeling the approach of dissolution, the elephant retires to a solitary valley, and there resigns himself to death. There is a similar belief in India.

Elephants are expert swimmers, though they cannot jump a trench 8 feet wide. Large numbers of them are annually sent across the Ganges between Dacca and Barrackpur, and are sometimes six consecutive hours without touching the bottom. Mr. Sanderson had seen an elephant swim a river 300 yards wide with his hind legs tied together. They are sometimes drowned.

At that lecture Mr. Sanderson gave the opinion that there is no diminution in the numbers now obtainable in Bengal; and that in Southern India elephants are annually appearing in places where they had never been heard of before. But the diminution of the forests, the increase of population, the destruction of the weaker by the stronger males, the captures of such great number, the deaths during the capture, and the cessation of breeding amongst the captives, cannot but greatly diminish the numbers of the free elephants. Out of the 33 driven into the kheddah in Mysore on the 1st July 1874, no fewer than 9 died before they could be tamed.

During the three years previous to Mr. Sanderson’s lecture, 508 elephants had been captured by the Dacca kheddah establishment in a tract of country 40 miles long by 20 broad, in the Garo Hills, whilst not less than 1000 were met during his hunting operations. Baber states that in his time elephants abounded about Calpi, and in Karrah and Manipur; and Akbar fell in with a herd near Colhua, in the east of Malwa.

Under Mr. Sanderson’s arrangements, when an elephant chases the takers, they betake themselves to the shelter of tree trunks, bamboo clumps, or long grass, and it is astonishing to see how they frequently escape uninjured. He had known many cases of men standing against a tree, or hiding in tufts of long grass, within a couple of yards of elephants that were passing in indecision, without being discovered, though the elephants were evidently aware of their close proximity, as they kicked up the ground in anger, and then made off. In such cases the slightest movement would have led to the hunters being instantly trampled to death. Men are frequently killed, but they are almost always young hands who are learning. He saw one such make a narrow escape. He ran from an elephant and climbed a tree; the elephant butted the trunk, and the man fell down, but his pursuer was so astonished at the sight, that she fled at once. Sometimes drives are conducted by torchlight, and these seldom fail, owing to the elephant’s fear of fire. The scenes on these occasions are exciting beyond description.

The African elephant is usually less in size than the Asiatic species. The head is rounded, the front is convex instead of concave, the ears are much larger, and the general physiognomy is quite different from that of the Indian elephant. The tusks of the adult males of this species are very large, and of great value. They are imported into England in great quantities from different parts of the African continent, in the unexplored interior of which this huge animal is still met with in great abundance.

The elephant has, besides the tusks, only grinders, twenty to twenty-three on each side of the jaw. The milk grinders, four in number, one in each side of either jaw, are completed soon after birth, and are said to cut in about eight or ten days. The tusks may be 8 or 10 feet long, or only as many inches. They may weigh 225 lbs. the pair, or they may not reach as many ounces. In rare instances a considerable portion of the tusk is found to have been injured by a musket ball, the iron or leaden bullet being enclosed in it. Two instances, if not more, have occurred in which these bullets were of gold, showing that the shot was fired by royal hands, for it is the reputed custom among Eastern potentates to use gold or silver bullets in their sports. Some of these golden bullets is stated to have been cut through by a comb maker in dividing a tusk. The portion of the tusk thus injured is generally useless for any ornamental purpose for many inches each way around the ball; but cases have occurred in which a ball, and even a spear-head, has entered at the thin part near the skull of the animal, and become embedded without injury to the external surface.

The elephant has been discovered fossil in the strata of the Nerakka and in Burma. Amongst the remarkable remains brought from the Siwallik Hills in Northern India by Captain Cauley and Dr. Falconer, were the remains of several species of the genus Elephas and other proboscidean animals. This fossil fauna is composed of representative types of mammalia of all geological ages, from the oldest of the tertiary periods down to the most modern, and of all the geographical divisions of the old continent, grouped together into one comprehensive assemblage. Among the forms contained in it, there are, of the Pachydermata, several species of mastodon, elephant, hippopotamus, rhinoceros, anoplotherium, and three species of equus; of the Ruminantia, the colossal genus swithaurum, which is peculiar to India, with species of camelus, bos, cervus, and antilope; of the Carnivora, species of most of the great types, together with several undescribed genera; of the Rodentia and Quadrupms, several species; of the Reptilia, a gigantic tortoise (colossochelys), with species of enyms and trionyx, and several forms of galrials and other crocodiles. To these may be added the remains of struthiones and other birds, and also fishes, crustacea, and mollusca. The genus Elephas, in the collection which has been desposted in the British Museum, includes six species or varieties, viz.:

E. planifrons, distinguished by the flatness of the forehead and the intermediate character of its molar teeth.
E. namadicus, with a great development of the cranium, and teeth closely allied to those of the Indian species.
E. bryndicus, with a turban-like vortex of the skull and teeth, whose structure approaches that of the African elephant.
E. Gansea is the most remarkable of the Siwallik species. A skull exists, with remains of the other species, in the British Museum. The total length of the cranium and tusks is 14 ft; length of the skull, 4 feet 2 inches; width of the muzzle, 2 feet length of the tusks, 10 feet; circumference of the
ELEPHANTA.

Tusk at the base, 26 inches. The other two species are named E. insignis and E. bombifrons. Besides these, the Bengal Asiatic Society's Museum had one called E. Cliftii. — Owen's British Fossils; Falconer and Cautley, Fauna Antiqua Sceletis; Elephantina; Crawford, Embassy; Beng. As. Soc. Cat.; Smith's Nepal; Yale, Emulsion; Yale; Cathay; Gosse, Nat. Hist.; Teeman's Sketches; Birkmore, Trav.; Wallace, Archip.; Aide, Memoire; Studies, pp. 24–26; Williams' Story of India, p. 195.

ELEPHANTA, or Gharapuri, is an island about six miles from Bombay, and four from the mainland. It was named Elephanta by the Portuguese, from a large stone elephant, 13 feet 2 inches in length, and about 7 feet 4 inches high, that stood near the old landing place on the S. side of the island. The most striking of the sculptures are the lingas and colossal three-faced busts on the trimurti, or tri-form figure. The central face is mild; on its right is that of Rudra (Siva), and on its left Vishnu. — Ferg. and Burgess, 465, 568.

ELEPHANTA, the designation which the October storms bear, all over the western side of India, is conferred on them as occurring about the time when the sun is in the constellation Hasthil, the Sanskrit for elephant. But as they reached Bombay from nearly due east, their name is there not unnaturally imagined to have been conferred on them from the celebrated island Elephanta, or Gharapuri. The elephantas commonly makes its appearance a fortnight or so after the S.W. monsoon weather has fairly cleared up, when showers have almost ceased to fall, the barometer has become high, the sky bright and clear, and the alternating sea and land breezes have set in. For three or four evenings before its appearance, superb piles of thunder-clouts are seen to accumulate about 9 o'clock, or on the evening or after the Ghats; they soon ascend some way in the air, advancing apparently against the sea-breeze, — that is, the upper and lower strata of air move opposite ways to each other. Magnificent displays of lightning, with low growling thunder, prevail as twilight sets in; an hour or two after sunset the sky resumes its serenity. At length the clouds grow darker and more watery, the thunder becomes louder, the lightning more brilliant; they tumble up the sky, rolling in vast masses over each other, till a sudden squall bursts, and a deluge of rain follows. This scarcely ever occurs earlier in the day than 3 P.M., and it very seldom continues till dawn, though after three or four hours it is sometimes resumed before noon the next day. When once the gloaming over, the sky in general clears up, the clouds vanish, the alternate winds resume sway, the hot days and dewy nights succeed, and the settled season commences. From 1840–1857, Bombay was five times without a squall from the east, with rain and thunder; it has usually happened between the 7th and 10th October. — Bombay Standard and Chronicle of Western India.

ELEPHANTIASIS.

Dav'A Fel., ARAB. Goni-parangi, SINGH. Hapa'ii-ka-paon, DEHK. Ani kal, TAM. Gaj'a-pada, SANSK. Yenuga-kalu, Tel. 3u 1041

ELEPHAS INDICUS.

This disease generally attacks the legs and feet; but the arms, the skin of the scrotum, are sometimes affected by it.

ELEPHANT MOUNTAIN, five miles N.E. from Madura. It is a block of granite, 2 miles long, a quarter of a mile wide, and about 250 feet high. A porch and a temple have been hewn out of one side of it.

ELEPHANTOPUS SCABER. Linna. Shamshulun, ... BEN. Hishi kaaska, ... Tel. Samdalun, ... HIND. Eungu bira, ... Ani soupali, MAL. TAM. Eddu malike chuta.

This plant grows in the Peninsula of India, and its leaves are used in medicine.

ELEPHANT ROCK. In Ceylon, Allagalla, Etagalla, and Goomeragalla, all signify the Elephant Rock. The former—the grand mountain up whose precipitous sides runs the railway incline of 1 in 45 for 13½ miles—is simply the Allia (Untusked Elephant) Rock. The rock which, like an elephant couchant, guards Kornegalle, Etagalla, is the Tusked Elephant Rock; and the strange massive block which towers over and gives its name to one of the finest estates in the Knuckles, is the Goomeragalla, Speckled Elephant Rock. The rock at a distance gives the outline of an elephant, and the patches of cryptoganas which spot its precipitous sides has led to the specific name, — the Goomer elephant being a semi-leprosous one, in an advanced stage of the cutaneous affection.

ELEPHANT'S TAIL, Hair of Hath'i-dum-ka-bal, DUKH. Ani kal myr, ... TAM. Beram rambut, MALAY.

Of this article, Yenuga toka ventraneuhi, Tel., rings, bracelets, and other female ornaments are made in India. — Mis. Mat. Med.

ELEPHANTS' TEETH are obtained in South Africa, India, Ceylon, Burma, Siam, and Cambodia. They should be chosen without flaws, solid, straight, and white; for if cracked or broken at the point, or decayed inside, they are less valuable. Every specimen, however, is useful to a greater or less degree, and can be entirely used. The largest and best delivered in China weigh from 5 to 8 to a pikul, and decrease in size to 25 in a pikul. The number of articles which the Chinese make of it, and the demand for them on account of their exquisite workmanship, render the consumption very great. The circular balls which the Chinese make of ivory, as well as their miniature boats, fans, chequers, boxes, and fancy articles of all descriptions, are specimens of carved work unequalled in any other part of the world. From a quantity of ivory not weighing over three pounds, they will make toys worth a hundred dollars. The largest teeth are sometimes valued at 120 dollars a pikul, but the article usually ranges from 50 to 80 dollars per pikul. A large proportion of the ivory brought to China is re-exported in fancy carved ware. — Morrison, Co. D.

ELEPHAS INDICUS. Cuv.

Asi. CAN., TAM., Tel. | Hath, DUKH.

The elephant occurs in Ceylon, in the south of the Peninsula of India, at the foot of the Himalayas, in Burma, and in the Eastern Archipelago.

Elephas primogenus, the mammoth. One was discovered in 1799 by a Tungus, near Lake Oucool in Siberia.
The various vernacular names and the botanical synonyms will show that both the scientific and the unscientific world have believed that the round and conical-seeded cardamoms are the products of two species; but Mr. Thwaites, after a careful comparison of growing specimens, was satisfied that the plants producing respectively the round and the long cardamoms of commerce are not distinct species, but merely two varieties of the present species. In every essential particular the structure is similar in the two plants, the only difference being that var. \(a\), which produces the round cardamom, is a little taller, with rather narrower and less firm leaves, and that its fruit is more aromatic as well as different in form from that of var. \(b\). The seeds of both varieties are used by the Singhalese to chew with their betel, and as medicines. The long cardamom, called Easal in Ceylon, grows wild in the Ceylon forests up to 3000 feet; but the round cardamom is there only a cultivated plant, and is called by the Singhalese Ambal or Ambi. The wild or natural cardamom is of no less value in the market than those of Malabar. In the Travancore forests they are found at elevations of three or five thousand feet. The mode of obtaining them is to clear the forest of trees, when the plants spontaneously grow up in the cleared ground. Before the commencement of the rains in June, the cultivators seek the shadiest and woodiest sides of the loftiest hills; the trees are felled, and the ground cleared of weeds; and in about three months the cardamom plant springs up. In four years the shrub will have attained its full height, when the fruit is produced, and gathered in the month of November, requiring no other preparation than drying in the sun. The plant continues to yield fruit till the seventh year, when the stem is cut down, new shoots arising from the same root. The seeds are gathered from the fruits. Cardamoms are much esteemed as a condiment, and great quantities are annually shipped to Europe from Malabar and Travancore. In commerce there are three varieties, known as the short, short-long, and the long-long. Of these the short are more coarsely ribbed, of a brown colour, and are called the Malabar cardamoms or Wynad cardamoms. They are reckoned the best of the three. The long-long are more finely ribbed, and of a paler colour. The seeds are white and shrivelled. The short-long merely differ from the latter in being shorter or less pointed. It is usual to mix the several kinds together when ready for exportation. Some care is required in the process of drying the seeds, as rain causes the seed-vessels to split, and otherwise injures them; and if kept too long in the sun, their flavour be comes deteriorated. In Travancore they are chiefly procured from the high lands overlooking the

Dindigul, Madura, and Tinnevelly districts. In these mountains the cultivators make separate gardens for them, as they thrive better if a little care and attention be bestowed upon them. Cardamoms are a monopoly in the Travancore State, and cultivators come chiefly from the British provinces, obtaining about 200 or 210 rupees for every caddy delivered over to the Travancore Government. The average number of candies for the years 1845-54 was about 300.—**H. D.**; *Thc. E. Pl. Zeyl.* p. 318. See Cardamoms.
ELEUSINE INDICA.

ELEUSINE INDICA. Grev.
Cynosurus Indicus, Linn. | Panicum compress, Forsk.
Grows throughout India. Tufts of it are conspicuous everywhere among other grasses of Tussariser.-*Mason.*

ELEUSINE STRICTA. Radd.

This species is larger in size and more productive than *E. coracana.* It is cultivated in *S.* India to a large extent, and, like Dolichos uniflorus, yields in favourable seasons more than a hundred-fold. The spikes are straight and large, and their great weight bends the head down in a horizontal direction.

ELEUSIS. The mysteries of Osiris and those of Eleusia were of the same character, commemorative of the first germ of civilisation, the culture of the earth, under a variety of names, Ertha, Isis, Diana, Ceres, E. In the terra-cotta images of Isis, frequently excavated about her temple at Paestum, she holds in her right hand an exact representation of the Hindu lingam and yoni combined; and on the Indian expedition to Egypt, of 1862, Hindu soldiers deemed themselves amongst the ancestors of our own goddess Iswara (Osiris), from the abundance of their amorous representations.-*Tod.* See Earth; Mirttika.

ELEUTH, a tribe of the Kalmuk, dwelling in Zangaria. See Kalkas.

EL-FYN. Arab. The evil eye.

EL-FATTAH, a town at the southern opening of the Hamrin Hills, at which the Tigris makes its exit from the hills.

ELGHAR or Yelghar. Pers. The forced march of an army, or sudden incursion, or raid.

ELGIN. The Right Honourable James, Earl of Elgin and Kincardine, K.T., G.C.B., and G.M.S.I., succeeded Lord Canning as ViceroY of India on 12th March 1862. He was born in London in 1811, and died and was buried at Dharmasala in the Kangra valley of the N.W. Himalaya on the 26th November 1863. In April 1857 he was appointed Ambassador to China; and in August 1858 he concluded a treaty at Tien-tsin. He subsequently concluded a treaty with the Japanese at Jeddo, and he returned to Great Britain. In March 1860 he was appointed Ambassador to the Emperor of China, and a treaty was signed at Pekin. The French convention was signed the following day.-*Toch, Narrative of Events.*

ELIJAH, also called Elias, a Hebrew prophet of Tishbeh beyond the Jordan, in Gilead. The Ali Ilii sect of Karund revere him as an incarnation of the deity. A makan or resting-place of Elias exists on the borders of the Kassan and Suleiman governments of Kurdistan. The Mahomedans believe that Elias never died, but is still on earth, awaiting the second coming of Christ. These views they derive from the Jews, some of whom even took Christ for Elias. The Syriac and Arabic identify Elias with Bokhsh Khaz. A well and a chapel in the ascent to Mount Sinai are named after the prophet Elias, whom the Scriptures state to have sought refuge from the persecutions of Jezebel in the solitudes of Horub (see 1 Kings xix.). Its presence in this situation, mentioned also by Edrisi, seems to be an argument for the identity of Jabil Musa with the Sinai of the Scriptures.-*Hamilton's Sinai,* p. 28. See Karund.

ELIM, mentioned in Numbers xxxiiii. 10, "they removed from Elim, and encamped by the Red Sea."—Wellsled (Tr. ii. p. 44) supposes to be Girandel, where there is still water and palm trees.

ELIJUN, also Helian, the Most High God of the Egyptians,—Hightanah kabiri.

EL-KADA. Arab. Trichelia emetica, Poir. A tree 60 to 100 feet high. Its fruit is fragrant, and is an ingredient of the abhr or beaten, with which the Mahomedans often wash their hair.—*Hogg.*

EL-KASS, a lofty, extensive, but disturbed mound in Babylonia, supposed by some to have been the site of the royal palace of Nebuchadnezzar, and the hanging gardens of his queen Amytis.

EL. KUSH, an ancient town of Babylonia; its ruins are 11 miles E.E.S. of Felujah. The ancient kingdom of Babylonia comprehended a narrow tract along the river Euphrates, extending from the neighbourhood of Erekh, or from about the modern town of Shink-el-Shuyukh, to Babel, a distance of about 164 miles in a direction westward of north, and continuing from thence 287 miles further in the same direction to Calneh, on the Khabur. The kingdom extended eastward till it joined Assyria, including Akkad and two other cities no less remarkable. One of them bears the name of El Kush, extensive ruins about the miles E.E.S. of Felujah, and the other is the supposed site of antediluvian Sippura, Sircrah of the Arals (Lient. Lynch), which is within the Medina wall, near the southern extremity.

ELU.

The ell measure is taken from the length of the forearm. Aratni, SANSK., is the short ell measure.

ELLA, in Hindu mythology, is the earth personified,—the Eartha of the Saxons, Ard in Hebrew. She is sometimes described as the daughter, sometimes as the sister, of Ishwacu. In Hindu mythology, according to Colonel Tod, the serpent (Buhas) ravished Ella, daughter of Ishwacu, the son of Men, whence the descent of the Pharaohs, his descendants in the East, Manus, or men. He says that in Portiess there is a lingam entwined with a brazen serpent, brought from the temple of Isis at Pompeii; and many of the same kind, in mosaic, decorate the floors of the dwelling-houses; and that there are wreaths of lingams and of the yoni over the doors of the minor temples of Isis at Pompeii, while on another front is painted the rape of Venus by Mercury. The Lunar race, according to the Puranas, are the issue of the rape of Ella by Buhas. See Eleusis; Il.

ELLA KUDA, a term given to the Eastern Ghats, from Vella, white, Konda, mountain.

ELLAMMEN, one of the Grumma-devata in Southern India. She has been identified by Hindus with Renuka, the wife of Jamadagni, father of Parashurama.

ELLENBOROUGH, EARL OF. ELLENBOROUGH, EARL OF.

ELLENBOROUGH, EARL OF, Governor-General of India from the 28th February 1842 to the 29th July 1844. He had been President of the Board of Control during the Duke of Wellington's administration. While holding the office of Governor-General, he moved armies into Afghanistan to recover the positions which had been lost during
his predecessor Lord Auckland's time, by the retreat and destruction of a division of the British Indian army. And the officers who won distinctive in this forward movement were Pollock, Nott, Sale, Dennic, Montech, Broadfoot, Fenwick, Mayne, Havelock, Pattison, and Oldfield.

During his administration, General Sir Charles Napier defeated the Amirs of Sind, and that country was annexed, and slavery abolished. After the death, without heirs, of the Maharaja Sindia, in December 1843, the Maharani, with the approbation of the Indian Government, adopted the deceased's nearest relative, a boy named Jungi Rao Sindia, who assumed the title. But in the dispute which occurred as to a regent, Dada Khango Selchul obtained power, and was opposed to the British, and an army under Lord Ellenborough moved against Gwalior, and two battles were fought on the 29th December 1843, one at Maharajpur by Sir Hugh Gough, the other at Punniar by General Grey. The Gwalior fort was then surrendered. In April 1844 Lord Ellenborough was recalled by the Court of Directors, under the provisions of Mr. Pitt's bill of 1784.

ELLICHPUR, a town in East Benar, of considerable size, though greatly decayed. A military cantonment of the Hyderabadi contingent is near. The town is in lat. 21° 15' 20" N., and long. 77° 29' 30" E., and has about 27,017 inhabitants.

ELLIOT, CHARLES MORGAN, Captain Madras Engineers, obit 1853? brother of Sir Henry Elliot. He was employed from 1846 to 1849 in the Magnetic Survey of the Indian Archipelago. In this duty he visited Moulucin, Madras, Nieoer, Sambungin, Penang, Pulo Dinding, Borneo, Celebes, Pulo Penang, Singapore, Carim, Pulo Buaya, Sumatra, Batavia, and the Kokos or Keeling Islands.—Magnetic Survey.

ELLIOT, SIR HENRY MIERS, K.C.B., one of fifteen children of Mr. John Elliot of Piniclo Lodge, Westminster. He was born in 1808; was educated at Winchester School and Oxford, from which he passed into the civil service of the E. I. Company in Bengal, and twice filled the post of Foreign Secretary. He published, in 1846, a Supplementary Glossary of Indian Terms. In 1849 he published the first volume of his Bibliographical Index to the Historians of Mahomedan India. He collected many manuscripts, Persian, and Urdu manuscripts for a History of India, as told by its own Historians, but he died, aged 45, in 1863, at the Cape of Good Hope, before he could write more than the first volume. His widow finally entrusted the completion to Professor John Dowson, M.R.A.S., of the Staff College at Sandhurst; and in the ten years 1867 to 1877 that learned man produced eight volumes, containing extracts illustrative of Indian and Central Asian history from about 200 authors. The eight large volumes gave detailed accounts of 143 historical works, with extracts from their contents in English. Besides the original text of nearly all these works, he collected a large number of local histories, biographies, collections of letters, geographical treatises, etc., illustrating Indian history, and some works on other subjects. It consists of 421 manuscripts, chiefly Persian, and a large quantity of unbound papers, partly notices on historical manuscripts preserved in various Indian libraries, and partly translations of historical works prepared for him. He was possessed of a vast store of information, which his early death prevented him giving to the public.

ELLORA, in lat. 20° 2' N., and long. 75° 11' E., in the Dekhan, N.W. of Aurangabad. The entrance to the caves is 2064 feet above the sea. It is called by the people Yerula, and Ballor, and Varula, and is near Roza in the Dowlatabad province of the Dekhan. The plateau of Roza, in the face that looks into the valley of the Godavery, is scarped, and the porphyritic greenstone amygdaloid rock has been excavated into great caves and temples, and dwellings about thirty in number. They are partly Buddhist, partly Jaina, and partly Brahmanical.

The Buddhist group of cave-temples occupies the southern extremity of the crescent in which the caves of Ellora are excavated. Later on, the northern horn was taken possession of by the Jains, who excavated there a remarkable series of caves. But between these two, at an intermediate age, the Brahmanas excavated some 15 or 16 caves, rivalling those of their predecessors in magnificence, and exceeding them in richness of decoration. The series culminated in the Kailasa, which is the largest and most magnificent rock-cut temple in India, and is the one in which their Brahmanical authors emancipated themselves from the influence of Buddhist cave architecture. The most northern there is a magnificent temple, known as Sita's Nani or Dunnar Lema; others are Ravan ka Khai, Raunswara, Nilakantha, Teli-ka-Gana, Kumharwara, Janwasa, and the Milkmaid's Cave, the last near a high waterfall.

The Ellora Buddhist caves are the Dherwara, Do Thal, Makarwara, Tin Thal, and Viswakarma chaitya.

The Brahmanical caves are Dasi-Avatara, Dunnar Lema, Kailasa monolithic temple-caves between Kailasa and Raunswara, Raunswara, Nilakantha, Teli ka Gana, Kumharwara, Janwasa, Milkmaid's Cave, and small caves above the scarp.

The Jaina caves are Chota Kailasa, Indra Sabha, and Jaganath Sabha.

The chief structure, called the Kailasa, is a perfect Dravidian temple, complete in all its parts. It is one of the most wonderful and interesting monuments of architectural art in India. It is a model of a complete temple such as might have been erected on the plain. In other words, the rock has been cut away externally as well as internally. It measures 138 feet in front, 247 feet in length by 150 feet in breadth, the height in some places being 100 feet. This temple is said to have been built, about the 8th century, by Raja Edu of Ellipich, by whom the town of Ellora was founded, as a thank-
offering for a cure effected by the waters of a spring near the place. The lofty basement of the temple has a row of huge elephants and sardulias or lions, griffins, etc. It is surrounded with figures also of Vishnu, and the whole Puranic pantheon.—Fergusson’s Eastern Architecture, p. 384: Ferg. and Burg, p. 450. See Architecture.

ELLORE, a town in the Godavari district of the Madras Presidency, in lat. 16° 42’ 35” N., and long. 81° 9’ 5” E., with 25,487 inhabitants; it is to the west of the Kolar lake in the Northern Circars. It is but little elevated above the sea, and is a civil station of the Madras Presidency. It is called by the natives Upu (or salt) Ellore, to distinguish it from Rai (or stony) Ellore, the Vellore of the madras.

EL-M-BARK is the Yu-pi, Fen, or Tsien-yeh-yu-pi of the Chinese. The liber of the banks of Ulmus Chinensis and U. pumilla are used in China medicinally.—Smith.

ELOHIM, God, the eternal Lord, is sometimes so called in the Bible, the meaning being Godhead or Gods; also called Jahvah (pronounced Jehovah), but the word was not spoken.—Adonai, the Lord, was used instead. Gen. ii. 3 alone uses Jehovah.—Bussens, iv. p. 379. See Elin.

ELPHINSTONE, the Honourable Mount-Stuart, a civil servant of the East India Company, who went as ambassador to Shah Shuja-ul-Mulk, king of Afghanistan. In 1802 Shah Mahmud was driven out by Shuja-ul-Mulk, the younger brother of Zaman Shah, and Shah Shuja was still in possession of the undivided empire of Ahmad Shah at the time of Mr. Elphinstone’s mission in 1809. This mission was sent for the purpose of connecting with Shah Shuja the means of mutual defence against the threatened invasion of Afghanistan and India by the Persians, in confederacy with the French. He proceeded through Bikanir, Bahawulpur, and Multan, and reached Peshawur on the 25th February. The expenditure was lavish, and on the 14th June the mission left Peshawur on its return. He had scarcely left Kábul ere Shah Shuja was driven out by Shah Mahmud, with the aid of Futté Khan. He was afterwards Resident at Poona, while the last Peshwa, Baji Rao, was ruling the Mahrrata states, and subsequently was Governor of Bombay. He wrote—Account of the Kingdom of Caubul, and its Dependencies in Persia, Tartary, and India; History of India, Hindoo and Mohammedan Periods; Report on the Territories conquered from the Paishwas. He is the most judicious and impartial of all Indian historians.—Dr. Burton’s Catalogue.

ELPHINSTONE, Lord, Governor of Madras 1836 to 1840; Governor of Bombay at the period of the revolt of the solildery of Bengal, during which some of those of Bombay also were implicated. Died 19th July 1860.

EL-SHAM-I-SHARIF, also Sham, the eastern names of Damascus.

EL-SHARK (Us-shark), the East, the popular name in the Hejaz for the western region as far as Baghdad and Basra, especially Najd. The latter province supplies the Holy Land with its choicest horses and camels.—Burton’s Mecca, ii. 4.

ELTAZAI, a branch of the Kambarati tribe, who occupy Baghan in Baluchistan.

ELTHAM, descendants, more or less pure, of Rajputs, and other Kshatriyas of the plains, who sought refuge in the Nefal mountains from the Mahomedans, or took military service as adventurers. The Elthamians speak only the Khas language.

ELUKA JIDI CHETTU. Tel. A plant resembling mimint, eaten in times of dearth; perhaps Hydrocotyle rondifolia or Marsilea dentata.

ELUTH, also called Sangarium, a Mongol tribe, whose mode of life, in habitations, food, and drink, resembles those of the Kirghis. Along with the Torgot, Kalkas, and Khoit, they occupy the country about Lake Koko Nor. See Kalkas.

ELYMAIS, according to De Bode, the modern Tengu-Sakul in the province of Pars. The name, according to Professor Max Muller, has been derived from Aliana, a supposed corruption of Airyana. The Persians, Medians, Bactrians, and Sogdians all spoke, so late as the time of Strabo, nearly the same language, and claimed for themselves one common name, in opposition to the hostile tribes of Turan. And when, after years of foreign invasion and occupation, Persia rose again under the sceptre of the Sassanians to be a national kingdom, we find the new national kings the worshippers of Masdanes, calling themselves, in the inscriptions deciphered by De Lacy, ‘Kings of the Arvian and Asian races’; in Pehlevi, Iran wa Aniran; in Greek, Αραυαοι και Αραυαοι. Colonel Chesney says that Elymais or Sosriata was the capital of the province from which the hardy Cossai spread their conquests over Susiana and the districts eastward. The Elymaeans inhabited Mount Zagros, which is on the southern confines of Media, and overlooks Babylon and Susiana.—Chesney: Max Muller’s Lectures, i. 226; De Bode. See Turban.

ELYTRA, or wing-sheaths, of several of the beetles of India are highly lustrous, and are articles of trade. See Beetles; Insects.

EMBELIA, a genus of plants of the natural order Myrsinaceae. E. baseal, nutans, ribs, robusta, and villosa are known. The leaves and berries of E. baseal of the W. coast of India are used in medicine (Roxb. i. 587). E. pentandra, Ambut, Dukh, is a scaldent shrub with alternate polished leaves; flowers in the cold season; fruit red; size of a currant.—Riddell.

EMBELIA RIBES. Burm. E. glandulifera, Roxb. | E. ribesoides, Linn.

Babirung, Bai-barung, BHS. | Visha-al. | MALEAL.

Kar-kunnii of | BOMBAY. | Vayu velagamu. | Tel. | Vishal, Veilai, | TAM.

Wai-warung. | Yavn velungamu. | Tel.

A scaldent shrub growing in the Peninsula of India and at Sylhet. Its berries are pungent, and used to adulterate black pepper. They are stated to be anthelmintic and cathartic.—Roxb. i. 586.

EMERIZINE, a sub-family of birds of the family Fringillidae. They comprise the genera Emberiza, Euphiza, and Melophus, the buntings, ortolans, corn buntings, and reed buntings. Three or four visit India during the winter.

Emberiza pittyornis, Pallas, white - crowned bunting.

E. cia, Linn., white - browed bunting of S. Europe, is common in the W. Himalaya.

E. pusilla, plentiful in Sikkim, has occasionally been observed in Europe, even so far west as Leyden.

E. fucata of N. Asia, Japan, and common in the W. Himalaya, occurs sometimes in considerable numbers in Lower Bengal.

E. melanocephala of S. Europe is common in parts of India.
EMBROIDER S. "EMBROIDER Y."

EMBROIDERY. - F. miliaria, the common bunting of Europe, W. Asia, Arabia (Schlegel), Barbary. F. citrinella is the yellow bunting of Europe, to beyond the polar circle; and is replaced in the W. Himalaya by F. pithyornis, an inhabitant also of Siberia, which occurs rarely in W. Europe.—Blyth. EMBROIDERY OFFICIAL. Geirn. Phyllanthus emblica, Linn. | Myrobalanus emblica, B. Amola, Amola, ... Beng. Kakodong, ... Malay. Embile myrobalan, Eng. Embile, Ambila, ... Panj. Myrobalan u. Ang, Gl. Umriti, Amalaco, Sansk. Amalika, Amalika, ... Hind. Anuessa nelli, ... Singh. Aruhi, Aungara, ... N. Tam. Malay. Malai, Malai, ... Malai.

A crooked tree, almost the thickness of a man’s body. It grows in Ceylon, in the southern part of the Peninsula, in Ceylon, the Southern Mahtratta country, the Konkan, the Dekhan, in the forests of the Godavery and Ceylon, in Bengal, on the banks of the Jumna, the Panjab, all over the forests of Kamnaon, in the outer Himalaya, and eastwards in the Malacca. The wood is hard and durable, is used for boxes, and for veneering. It is good for well rings, does not decay under water, and is well adapted for turning. The strongly astringent bark is used as a tanning material, and in dyestuffs and diarrrhea. The myrobalan fruit can be pickled or preserved in sugar. Native women consider the powder they use to possess cologne properties, and to be good for the hair, and use it mixed with either water or milk. The fruit is also used for making ink, and to obtain a black dye.—Beddome; Mr. Rohde; Cleg. Rept.; O’Sh.; Stewart; Honigberger.

EMBROIDERY.

Tatia, ... Arab. Chikawado, ... Hind. Brodie, ... Fr. Chikankari. Stickerei, ... Ger. Ricamatura, ... It. Kashida Zarodo, ... Hind. Bordado, ... Sp.

The art of embroidery is one consonant with the habits of the people of India; their patience and delicate handling render success certain, and there is scarcely a town or city where creditable embroidery on silk is not found. Those who have ever been celebrated for their skill in the art of embroidery, which appears to have been practised in Assyria, and introduced from thence into India. Pliny, however, mentions that it was a Phrygian invention, and in Rome embroiderers were called Phrygiones. The art of embroidery was known and practised with great skill in ancient times, in Egypt, Assyria, and Persia. The Israelites learnt the art before their exodus; the Babylonians were famed for their rich tapestries; and the Assyrian monuments display richly embroidered robes and trappings. In Babylon, clothes were woven of different colours, and called Babylonica. During the early part of the middle ages, Europe obtained its most important embroideries from Greece and the East. In the present day, the embroidery of Kashmir, Lahore, and Delhi is the most beautiful. Sikh embroidery has a character of its own, and it is very re cognisable. In India, embroidery is done on muslin, silk, velvet, merino, or cloth, in gold or silver thread, in a variety of styles, and very elegant and ingenious designs, on shawls, scarfs, jackets, bottle-stands, tablecloths, tablecovers, footstools, chess cloths, cushions for chairs, mats, bags, slippers, dresses of women, aprons, parasols, and book covers. In the embroidered fabrics of India, it may be mentioned, as a principle, that their patterns and colours diversify plane surfaces without destroying or disturbing the impression of flatness. They are remarkable for the rich diversion shown in the patterns, the beauty, distinctness, and variety of the forms, and the harmonious blending of several colours. Embroidery in gold and silver is an art which furnishes some of the most gorgeous, and expensive manufactures for which India has been long celebrated. In the taste and judgment evinced in the blending of brilliant colours, and contrasting them with gold and silver on grounds of velvet, satin, silk, or muslin, India in this manufacture stands unrivalled. Some are very gorgeous shaminahs and elephant saddle cloths. The gold and silver fancy fringes of Hyderabad are deserving of mention. Small samples of solid silver wire fringes and ornaments from Madura were deemed worthy of notice, but they are surpassed by the silver thread of Hyderabad. The embroiderers of India, though bringing into use, especially on her thinner textiles, a great deal of tinsel, the articles do not look tinselly, and the tasteful application of foil, tinted in various colours, often lends great beauty. Long deep borders and large centres embroidered in gold and silver are wrought with much skill, and the admirable contrasts made by the mingling of silver with gold, as well as the happy way in which the dispersing is managed, is well worth the attention of European embroiderers. The artistic judgment with which the golden embroidery is tastefully encrusted by finely executed scrolls done in silver, while the bright scarlet flowers lend and receive back brilliancy from the golden ground, out of which they are made to sprout, as well as the admirable dispersing itself of the gold, ask for, and ought to win, the notice of Europe.

Delhi is a great place for embroidered fabrics, both in silk and gold threads. In Lahore and Amritsar, the manufacture of kalabatsu, or gold thread, is extensively carried on. And Benares has long been famed for gold and silver threads, and especially its cutwork and embroidery. ‘From Dacca,’ says the Abbé du Goyon, writing in 1744, as quoted by Dr. Taylor, ‘come the finest and best Indian embroideries in gold, silver, or silk, and those embroidered neckcloths and fine muslins which are seen in France.’ There has always been a demand for such scarfs for the markets of Bussora and Java. In the present day, they have silks and woollens, muslins and nets, Kashmir shawls, European velvets embroidered with silk or tasar, that is, wild silk of either floss or common twisted silk thread, or with gold and silver thread and wire in great variety. The cloth to be embroidered is stretched out on a horizontal bamboo frame, raised about a couple of feet from the ground, and the figures intended to be worked or embroidered are drawn upon it by designers, who are generally Hindu painters. On woolen cloths, however, the outlines are traced with chalk, and then by needle and cotton, and the body of the design copied from coloured drawings. The embroiderers, seated upon the floor around the frame, apply the needle by pushing it from instead of towards them. In place of scissors they commonly use a piece of glass or chinaware to cut the thread. Among the embroidered articles at the Exhibition of 1851, those from Dacca and from Delhi were probably the best known. In Delhi, small shawls
EMBROIDERY.

and scarfs are chiefly embroidered both with floss and twisted silk. In Dacca, both nets and muslins with floss silk of various colours. But Dacca is also famous for its embroidery of muslins with cotton, which is called chikan kari or chikan dodi. One kind is formed by breaking down the texture of the cloth with the needle, and converting it into open meshes. Dr. Taylor states that Kashida is the name given in Dacca to cloths embroidered with muga silk or coloured cotton thread, and, though generally of a coarse description, gives occupation to a number of the Mahomedan women of Dacca. Though the scarfs of both Dilli and of Dacca are much admired, muslins or nets, worked so as to be suitable for making ball dresses, would probably be in demand, as those which are now sold in Britain for such purposes are very inferior in taste and elegance to the Indian embroidery. The beetle-wing embroidered exhibited in 1851 from Madras was particularly elegant; and the velvet awnings, musnad covers, hook and carps, elephant trappings, embroidered with gold and silver, chiefly at Murshidabad and Benares, were admired as well for richness as for the skill with which the groundwork was allowed to relieve the ornaments. The embroidered saddles and saddle-cloths and floor-coverings from Patiala, Multan, and Lahore were of the usual style of what are called the works of that famed valley, and which was conspicuously shown in the dresses, caps, and slippers from Kashmir itself. But that the skill and taste are not confined to one part of India, was also to be seen in the tablecovers from Tatta in Sind, and in the embroidered boots from Khyrpur, which Mr. Digby Wyatt illustrated.

In Southern India this art is practised, chiefly at the towns of Tanjore, Madras, and Secunderabad on lace, tussah, silk lace, muslin. The Tanjore and Madura web-stories are very superior in quality, and consist of a variety of elegant articles, particularly pocket-handkerchiefs, worked muslin dresses, scarfs, which show great taste in the patterns and beautiful finish.

The Chinese are famous for their skill in silk embroidery, and in Canton are shops for its sale. Buddhist nuns largely embroider silk. The skill of the Chinese, says Mr. Williams (Middle Kingdom, ii. p. 123), in embroidery is well known, and the demand for such work to adorn the dresses of officers and ladies of every rank, for embellishing purses, shoes, caps, fans, and other appendages of the dress of both sexes, and in working shawls, tablecovers, etc., for exportation, furnishes employment to numbers of men and women. The frame is placed on pivots, and the pattern is marked out upon the plain surface. All the work is done by the needle, without any aid from machinery. There are many styles of work, with thread, braid, or floss, and in one of the most elegant the design appears the same on both sides, the ends of the threads being neatly concealed. This mode of embroidery seems also to have been known among the Hebrews, from the expression in Deborah's song (Judges v. 50), 'of divers colours of needlework on both sides,' which Sisera's mother vainly looked for him to bring home as spoil. In China, books are prepared for the use of embroiderers, containing patterns for them to imitate. The silk used in this art is of the finest kind and colours; gold and silver thread is occasionally added to impart a lustre to the figures on caps, purses, and ladies' shoes. A branch of the embroiderers' art consists in the formation of tassels and twisted cords for sedans, lanterns, etc., and in the knobs or corded buttons worn on the winter caps, made of cord inter-twisted into the shape of a ball. Spangles are made from brass leaves, by cutting out a small ring by means of a double-edged stamp, which at one drive detaches from the sheet a wheel-shaped disc; these are flattened by a single stroke of the hammer upon an anvil, leaving a minute hole in the centre. Another way of making them is to bend a copper wire into a circle and flatten it. The needles are very slender, but of good metal. In sewing, the tailor holds it between the forefinger and thumb, pressing against the thimble on the thumb, to push it into the cloth.—J. B. Varis, Masterpieces of Industrial Art, Etr. of 1862; Williams' Middle Kingdom, ii. p. 123; Royce, Arts of India, etc., pp. 508, 507; Rev. Casuals.

In the northern province of Ceylon, its timber is used for common house buildings, and the juice of the fruit is used to rub over fishing lines for the purpose of hardening and preserving them; also for paying the bottoms of boats. A cubic foot weighs 45 pounds, and it is esteemed to last twenty years.—Mr. Meudis; Dr. Cleghorn.

EMERALD.

Zamarrud., ARAB, PERS. | Panna. HIND. Emeraude., | Smeraldo, IT. Smarrag., | Permaetej, MAL. Smarragdon., | Esmeralda, SP. Smarraglus., | Fetteche kallu, TAM. Nies Frouge., | HEB. TEL. This precious stone is mentioned in Exodus xxviii. 18; in Tobit, Judith, Ecclesiastes, and Ezekiel. The famous emerald mines in Jabl Zararab in Egypt—the Samarrudus Mens of the ancients—were worked 1560 B.C., in the time of the great Sesostris II., and by extensive galleries. They were again worked in the early part of the reign of Muhammed Ali, and about 1876 a British company undertook them. The mines (Bunsen's Egypt, ii. p. 303) were on the Kosseir road from Koptos to Aennum (Phileoteras). It is the rarest of all gems, of a beautiful green colour, unsurpassed by any gem. When of a deep rich grass-green colour, clear and free from flaws, it sells at from £20 to £40 the carat, those of lighter shade from 5s. to £15 the carat. The finest occur in a limestone rock at Muuz, in New Granada, near Santa Fé de Bogota, 5° 28', at Ondolchelon in Siberia, and near Arv. From ancient times many stones have been famed as emeralds, which can only have been jasper or other green mineral, such as the emerald pillars in the temple of Hercules at Tyre, the emerald sent from Babylon as a present to a king of Egypt, four cubits in length and three in breadth, and the emerald obelisk described by Herodotus, were all doubtless green jasper. The book of Esther describes the hall of king Ahazarus as paved with emeralds. De Carne mentions (p. 125) an emerald statue of Buddha, a cubit in height,
valued at £40,000, now in the pagoda of the king of Siam. It was carried off in 1777 from a pagoda in the city of Vien-chan in Upper Laos. In the United States very large beryls have been obtained, but seldom transparent crystals; they occur in granite or gneiss. One in the imperial collection of Russia measures 4½ inches in length and 12 in breadth. Another is 7 inches long and 4 broad, and weighs 6 pounds. Mr. Powell had seen a flat tablet of emerald, full of flaws, but otherwise of good colour, nearly 2½ inches square, worn as an amulet, and engraved all over. The maharaja of Kapurthala possesses a large oblong emerald of this kind, and the maharaja of Patiala has a round emerald of enormous size. A crystal in the cabinet of the Duke of Devonshire measures in its greatest diameter 3½ inches nearly; its lesser diameter barely 2 inches; its 3d diameter, 2½ inches; the extreme length of the prism is 2 inches. It contains several flaws, and is therefore only partially fit for jewellery. It has been valued at more than 500 guineas. A more splendid specimen, weighing 6 ounces, belonging to Mr. Hope, cost £500. Aquamarine includes clear beryls of a sea-green, or pale-bluish, or bluish-green tint. Hindus and Mahomedans use them pierced as pendants and in amulets. Many of the stones used as emeralds in India consist of beryl. Prismatic corundum or chrysoberyl, says Dr. Irving, is found among the Tora hills near Rajmahal on the Bunus, in irregular rolled pieces, small, and generally of a light green colour. These stones are considered by the natives as emeralds, and are called in Panjabi Panna. The most esteemed colours are the Zababi, next the Saidi, said to come from the city Saidi in Egypt; Raihani, new emeralds; Fastiki, old emeralds, that is, such as have completed their 20 years; Salkki, Zangari, colour of verdigris; Kirasi and Sabuni.

Most of the emeralds commonly in use in India are smooth, cut and bored like beads; they are always full of flaws.—Powell, p. 49; Tavernier's Tr. p. 144; Bausen's Egypt, ii. p. 308; Wellsted's Tr. ii. p. 323; Irvine, Med. Top.; Tomlinson.

EMERY.

This substance is greatly used in the arts for grinding and polishing hard minerals and metals. Corundum, emerald, ruby, topaz, sapphire, and emery are only surpassed in hardness by the diamond. Emery is regarded as granular or amorphous corundum, coloured with iron, and is not known to occur in India, where corundum and garnets are used by the people in its place. It was, however, sent to the Exhibition of 1862, from Monghir; and Callastry, near Madras, is also named as a site, also Ongole. In the mixed corundums of Greece and Turkey the iron seems equally diffused through the mass, imparting to it a bluish-grey colour; but in specimens which reached the Madras Museum from Southern India, the corundum and ore of iron, though occurring together, are not mixed, but remain apart, segregated, the corundum forming one side of a mineral, and the oxide of iron, in a lump or lumps, on the other side; and all such masses are magnetic, and possess polarity. In the arts, that of Naxos is preferred, as it is more uniform in its quality than that from Pulah and Gunuch. That from Naxos is of a dark grey colour, with a mottled surface, and with small points of a nicaceous mineral disseminated in the mass. It frequently contains bluish specks or streaks, which are easily recognised as being pure corundum. When reduced to powder, it varies in colour from dark grey to black, but the colour of its powder affords no indication of its commercial value. The powder of emery examined under the microscope shows the distinct existence of the two minerals, corundum and oxide of iron. The specific gravity of emery is about 4, but its hardness is its most important property in its application to the arts. The only difference in corundum seems to be the absence of oxide of iron. There could be no difficulty in preparing corundum powders of the requisite degrees of fineness. The selling price of corundum in London has ranged from £10 to £25 a ton. There seems no reason why the picked corundums should sell for less than the finest emeries; and Captain Newbold mentions that the corundums near Gram, when sorted into the three sorts known in commerce, viz. the red, the whites, and the scups, of these two are sold to the Arab merchants at Mangalore and Tellicherry at prices from 12 to 15 or 30 rupees the candy, equal to £4, £6, and £12 a ton.—Madras Museum Report. See Corundum.

EMIGRATION from British India and China is in a large and gradually increasing rate. From 250,000 to 350,000 of the Tanjore, Trichinopoly, Tinnevelly, and Madura districts, find employment every year in Ceylon. In the ten years 1872 to 1881 inclusive, 188,712 embarked from Calcutta, Madras, and French ports for the British, French, and Dutch colonies.

EMILIASONCHIFOLIA. D. C.

Emilia purpurea, Cos. | Crassocephalum son., Less. 
Cassalia sonchifolia, Lion. | Seneceio sonchifolia, Mench. 

In Southern Asia it is used in medicine. In China its leaves are used as salad.

EMODUS FLAVESCENS. Gray.

Monitor flavescens, Gray. | Varanus Pipiroti, Dum. 
M. exanthematicus, var. | and Bibb. 
Indicus, Schlegel. | V. Russeli, Schlegel. 
Indian empagasia, Eng. | Kabaara, . . . SINGH.

The colour of this reptile is olive, with yellowish cross-bands. Head-shields sub-equal; eye-brows with a central series of larger plates. It is found in Nepal.

EMU. Emu, or Enew, the Dromaius Nova Hollandiae of Australia, is generally dispersed over the whole interior of the continent. They are strictly monogamous. The whole duties of incubation, as well as the care of the young bird when hatched, devolve upon the male bird. This is believed to be the case with all other struthious birds.

EMYDIDÆ, a family of reptiles. See Reptiles; Tortoises; Turtle.

ENAM. HIND., Pers. Gifts or gifts, generally of land, and commonly in perpetuity, for charitable purposes. A jagir is usually an assignment of lands for service, or as a pension. Altungha is
ENAMEL.

An enamel in the arts is an artificial vitreous mass, the same as a paste, ground fine, then mixed with gum water, and applied by a brush, and fixed by fusion. The art of fixing colours by melting in fire, says Dr. Royle (Arts of India, p. 475), is of very ancient date. It was practised by the Egyptians, and carried to a high degree of perfection in Persia. The art is known in every part of India, and some exquisite specimens were sent to the Exhibition of 1851 both from Central and from North-Western India. It is chiefly employed in ornamenting arms and jewellery, not only in gold, but also in silver. In general, in India, ten parts of lead and three parts of tin are oxidized by continued heat and exposure to air. From the melted oxides add ten parts of powdered quartz, and ten parts of coarse salt, and melt in crucibles. Thus is obtained a white enamel, and the basis of coloured enamel, metallic oxides being added. Oxide of lead or of antimony produces a yellow enamel; reds are obtained by a mixture of the oxides of gold and iron. Oxides of copper, cobalt, and iron give greens, violets, and blues, and a variety of intermediate colours by mixtures. The workmen of Behar are stated to make two enamels, which are applied to the surface of some of the rings. One is yellow. Five parts of lead are melted in a shallow crucible, and to these is added one part of tin, and the alloy is calcined for four or five hours. It is then heated to redness in the crucible of the glass furnace. One part of white quartz is next added, and the mass stirred about for three hours. It is then taken out with a ladle, poured out on a smooth stone or iron, and cooled in water. They then take one part of their palest green glass, and add a fourth part of the other materials, to make the yellow enamel. The green enamel is made in the same manner; and to the melted glass is added, not only the prepared lead and tin, but a small portion of the black oxide of copper. In Mysore they make a bright yellow enamel, by first calcining five parts of lead and one of tin, then adding one part of zine, calcined in a separate crucible. When these begin to adhere, they are powdered in a mortar. When the maker of glass rings is at work, he melts some of this powder, and, while the ring is hot, with an iron rod applies some of it in powder to the surface of the glass.

The finest enamelled work of India is produced at Jeffery, and is considered of great artistic merit. The enamellers there came originally from Lahore. Their enamel is a kind of glass made in earthen vessels, and when fused, the colouring matters are added; the whole is then allowed to cool, and in this state is kept for use. Only pure silver or gold articles are enamelled. From the silver the enamel may come off in course of time, but it never does from the gold. All good enamel is consequently only applied to gold, which must be free from alloy, or otherwise it would tarnish by contact with the enamel in the great heat to which it is subsequently exposed. The gold is first carved of the required pattern; the enamel, having been ground to an impalpable powder, and made into a paste with water, is then placed on the exact spot required by the pattern. The article is then strongly heated, much skill being required to take it out at the precise moment when the enamel is thoroughly fused, but before the colours begin to run into one another. As soon as removed, the workmen then exert the full power of their lungs in blowing upon it as quickly and as violently as possible. The hardest colours are first placed in the furnace and fused, and then those which melt more easily. Afterwards, the whole is ground and polished. The translucent enamels for which Jeypore is famed, are enamel colours on gold or gold leaf, which gives light and brilliancy to the colours. Lord and Lady Mayo exhibited from Jeypore a cup, saucer, and spoon made in fine gold, and designed in most elegant forms. Each of these forms was heightened and defined by enrichment made by incisions into the metal in beautiful conventional ornament, subsequently filled in with transparent and opaque enamel pastes, but principally the former. After the work is perfectly dry, a second surface is heightened yet further by setting in diamonds in various ornamental forms. The result was a specimen of goldsmith's work as lovely (although, of course, in a very different style) as anything Colline or Caradosso ever did. Artisans form a small family, and the real process of enamelling is kept by them as a secret, which descends from father to son like an heirloom.

The Panjab is famed for its blue and green enamels. It is said that Kashmir has long served as a great field for artists emigrating from Persia; and a careful comparison of Persian with Kashmirian products leads one instinctively to the impression that Kashmir must certainly owe much of her delicate perception of the beauty of colour and floral form to her proximity to, and intercourse with, the time-honoured land of the Sun.

Enamelling, as applied in India to jewellery, consists of an extremely fine pencilling of flowers and fancy designs in a variety of colours, the prevailing ones being white, red, and blue, and is invariably applied to the inner sides of bracelets, armlets, anklets, necklaces, ear-rings, sapech, tiara, and all that description of native jewellery, the value depending upon the fineness of the work, and often exceeding that of the precious stones themselves. In general the cost is moderate, as the finest specimens are only made to order. The best come from Benares, Delhi, and the Rajputana states. In the south of India, the manufacture of enamels on articles of domestic use like the above is almost entirely restricted to Hyderabad. It presents no varieties, but in general consists of a blue coating interlined with white on a surface of silver, and is applied to rose-water sprinklers, spice-boxes, basins, and such-like articles. The merit of the manufacture lies in the simplicity of the enamel itself, and in the lightness of the silver article to which it is applied. Though pleasing, it is the coarsest enamel produced in India. At Indore in Central India, the manufacture does not constitute a regular trade. It is invariably applied to articles of personal decoration, such as necklaces, armlets, brooches, ear-rings, etc., which are set by native jewellers, according to the taste of the purchaser.
ENTEOMOSTOMATA.

The number of fish caught is never below 70,000 to 80,000 of all kinds, the principal belonging to species of the genera Circa, Cyprinus, Gobiob, Labes, Cunclodus, Cirrhinus, Cyprinodon, and Silurus. The largest specimens weigh about 55 lbs. each. Crocodiles of all sizes are found in the drag-net, but no casualty has been known to have been caused by them. Some 8000 to 10,000 persons are engaged in the taking and disposal of the fish, of which about 40 tons are annually sold on the spot.—Imp. Gaz.

ENGRAULIS ENCRASTICOLUS, Anchovy. Anchois. 

The anchovies of commerce met with in India are wholly imported. It is a small fish, about 4 inches long, with bluish-brown back, and silver white on the belly, very abundant in the Mediterranean, where, though occurring in other seas, they are chiefly caught at night by nets, their heads immediately taken off, their entrails removed, and pickled. Another Mediterranean species, E. melotta, is largely substituted for and mixed with the true anchovy. A species is said to occur in the Bay of Bengal, and is one of the fish made into faladanghy.

ENKIANTHUS QUINQUEFLORUS, a flowering plant of China, on mountains from 1000 to 2000 feet above the level of the sea, fixing itself in the crevices of the rock, in situations with very little soil. At the Chinese New Year its flowers are in great request in the south of China for: the decoration of the houses, boats, and temples, just as those of the Nandian are in the north with camellias, coxcombs, magnolias, and various plants which flower at this season. The enkianthus is brought down from the hills with the buds just expanding, and, after being placed in water for a day or two, the flowers come out healthy and fresh. At New Year’s day in Canton, the budding stems of the flowering almond, narcissus, plum, peach, and the Enkianthus reticulatus, or bellflower, are forced into blossom to exhibit, as indicating good luck in the coming year.—Fortune’s Wanderings; William’s Middle Kingdom, p. 286.

ENNORE or Katipak, in lat. 15° 14’ N., long. 80° 50’ E., 9 miles N. from Madras, a small hamlet on the southern end of the Falikat Lake, a marine lagoon.

An immense climbing shrub, forming elegant festoons, legumes from 1 to 5 feet long and 4 or 5 inches broad, formed of a series of joints, each containing one seed. They are roasted and eaten; enter into the native Matera Medica as an anti-febrifuge; are emetic, and used to wash the hair. Its gigantic pods excite astonishment in passing through the forests. Its seeds are made into boxes.—Cat. Ex. 1852; Tennant; Riddell; Moseley.

ENTOMOLOGY. See Insects.

ENTOMOSTOMATA OF De Blainville, a family of molluscs, in which are included the genera cerithium, planaxis, subula, teresba, eburnea, buccinum, nassa, harpa, doliom, oniscia, ricinula, cancellaria, and purpura. See Mollusca.

Equisetum Hyemale.

Equis hemipappus, Is. Geoffroy, inhabits the countries to the west of E. onager, viz. Syria, Mesopotamia, North Arabia, etc. The voice is like the bray of the common ass. This is considered by Blyth to have been the hemionus of the ancients.

Asinus teniopus, Henglin, onager of the ancients; Equis, asinus, wild ass. This species occurs wild in N.E. Africa and South Arabia.

Equis hemionus, Pallas, the kiang or dzightai of Tibet and Central Asia, is met with across the snowy Himalaya, in Ladakh, and other parts. It is much darker in hue than the Gor Khar or E. onager, Pallas, Blyth, E. Cuv., the upper parts being of a dull ruddy brown.

The zebras and quagga, genus Hippotigris, are of Africa. The horse has been found fossil in Ava.—Cat. Mus. Ind. Ho.; Jerdon, pp. 236-9. See Horse.

Equisetum Hyemale. Smith. Muh-tshih, Chin. This species of the horse-tail tribe of plants grows to a considerable height in marshy places in Kan-suh and Shen-si, and with E. arvenese is used to polish wood. A large quantity of silex, arranged in a beautifully regular manner in the calcareous structure, confers this property E. debile, Rosz., is a plant of India and Burma.

ERIA. See Chronology.

ERAGrostis, panicum, pennisetum, poa, rothella, saccharum, vilfa, are the grasses of the Deah. Several species of Eragrostis grow in the Panjeb, where they are called chinka, kur, lamb, and mirukar, and are considered good pasture grasses.

ERAN, a village of a tract of the same name in the Sagar (Sangor) district, Central Provinces, 48 miles west of Sagar town, in lat. 24° 5' 30" N., long. 78° 15' E., population (1870) 446; its monumental remains are attributed to Raja Bahrat. The chief of these is a rudely-shaped image of Vishnu in his boar avatar. The tip of the projecting tongue supports a human figure erect. The breast bears an inscription, and, as at Oodeghur (Odaigah), a young female hangs by the arm from the right, task. On one side of Vishnu stands a four-armed deity, above 12 feet in height, with gilt loins, a high cap, and round to his neck and reaching to his feet a thick ornamental cord. On the columns before this statue are seen figures weaving the sacred thread, with twisted snakes, elephants, nude female figures, seated Buddhas, faces of satyrs, and other devices. Besides these and other remains, there are three figures of crouching lions.—Imp. Gaz.

ERANDI. Hind. The castor-oil plant, Ricinus communis. The small plant is called Choti erandi; the larger, Barri erandi. It is the name of a tasar silk-moth, so called because it feeds on the castor-oil leaves.

ERANNOBAS, the same with the river Sone or Heranya. See Pataliputra-baha.

ERECH of Scripture, the modern Warka, near the Euphrates. It was founded under the second ruling dynasty, of the date B.C. 2286. See Karsa.

EREMURUS SPECTABILIS. Bieber, Pott's, Beng., Chineb. Shih, etc. Jhelum.

This magnificent plant grows in the Panjeb to 5 or 6 feet high, with close spikes of white flowers to half that length. It is common at places on the Upper Chnab and in the Jhelum basin, at from 6000 to 9000 feet. The leaves when young are much eaten, both fresh and dry, cooked as a vegetable, and are excellent treated as spinach.—Stewart.

ERI. as in the Madras suburb Vepery, means a tank, a large reservoir or piece of water. It is a Tamil word, sometimes a prefix, sometimes a suffix; Vepery means the Vepa tree (Azadirachta) on the tank.

ERIA. Hind. A silk fabric used in Assam, manufactured from the cocoon of a wild moth. In Assam each household reaps, spins, and weaves his own cloth, and the holiday attire of the Assamese is usually of silk. In Durrung, a than of good silk, measuring 10 yards, can be purchased for from 5 to 10 rupees, according to the fineness. The cloth is occasionally coloured, but the Assam-se silks are usually of the natural colour as wound from the cocoon.

ERICACEEE. De Candolle, the heath tribe of plants, comprising the genera Andromeda, Cassiope, Gaultheria, Rhododendron. Gaultheria fragrantissima, Wall., grows in Nepal, and there are several beautiful species of rhododendron in the Himalaya.

ERIGERON, a genus of plants of the order Compositae; several species occur in India. In Italy large bundles of E. viscousum, Linn., a viscos species, are dipped in milk and suspended in the rooms, to attract the flies.

ERIKA-YADU, the Yerkal race in the Peninsula of India, called also Yera Keddi. See Eruku. ERINACEIDEE, the hedgehog family of the mammalia. Species of the genera Erinaceus and Tupinca occur in India and the Archipelago.

This middle-sized tree is common on the Konkan ghat; flowers yellow, in terminal panicles, appear in September and October; fruit triangular, covered with bristles; angles somewhat winged; has a pleasing fragrance; bark is used for making ropes.—Jeffrey; Beddome.

ERINYS of the Hindus has been identified with the Greek Erinys; the word means the fleet runner.

ERIOBOTRYA JAPONICA. Lindl. Loquat. Mesplius Japonicus, Thumb. Yung-mai, Yang-ma, Chin. Kin-ling-taze; . . . Chinn. Lu-kiah, Kin-lin-tze, " P.F.P.. • • " This small tree of Japan and China has been introduced all over the Dekhan, the Panjeb, and also in Bengal, where it is much cultivated on account of its excellent fruit, the beauty of the tree, and the exquisite fragrance of its flowers. In the Botanic Gardens at Calcutta it blossoms twice in the year, but bears fruit only once, viz. in February and March. It also grows in great perfection in New South Wales, and bears fruit twice in the year, and is highly esteemed both for desserts and preserves. The finest fruit is produced at the second crop, at the end of the cold season, and requires protection day and night, from birds in the former, and flying foxes in the latter. The fruit is of a yellow colour, with thin skin, a sweet acid pulp, one or two seeds in the centre, sometimes more. The seeds grow easily, and the fruit appears to be capable of great improvement. In Ajar it is cultivated in gardens, but does not thrive well. A close connection between Chinese loquat and Chinese fig with peaches, plums, oranges, the Chinese gooseberry, Averrhoa carumbola, the wangi, Cookia punctata, the longan and longehen.—Rox.
ERIOCAULON CANTONIENSE.

The genus \textit{Eriocaulon}, the largest of the family, is also distributed in other parts of the world, especially in the southern hemisphere, and the eastern and western parts of the Indian Archipelago. It is known under the names \textit{Eriocaulon Ctenophorum} and \textit{Eriocaulon Pataginum}, which are found in the eastern and western parts of the Indian Archipelago, and in the eastern and western parts of the Indian Archipelago, respectively.

The genus \textit{Eriocaulon} is characterized by the presence of a slender, erect, and sometimes branched stem, which is covered with small, scale-like leaves. The flowers are small, greenish, and arranged in a raceme or spike, which is enclosed in a sheath of the leaves. The fruit is a small, dry, and seed-like body.

ERIOPHORUM CANNABINUM. Royce. The cotton grass, or bahur of Hindustan, grows throughout the Panjab Sivalik tract, and outer hills to 5000 feet; in the Salt Range most of the baggar or bahur rope appears to be made of Andropogon involutus; but part of the cordage for bedsteads, Persian wheels, etc., is made of this. Its seeds are clothed at their base with a cotton-like substance, with which pillows are stuffed and candle wicks made.—Royce; Stewart.

ERUVIAN, in lat. 40° 10' N., long. 44° 30' E., and 5107 feet above the sea, a town in Russian Armenia, of which it is the capital. It has been repeatedly taken by Turks, Persians, and Russians. From the time of Nadir Shah in 1748, it was in the hands of the Persians till taken by the Russians in 1828. The province of Erivan is watered by a network of canals, by the Karasun, the Zangi, Aharan, and the great Arpa Chai. It contains 408 villages.—Porter's Travels; Macgregor, p. 195.

ERRUKU.

Sinsic, \textbf{Arab.} | Ermelino, | \textbf{Ir.} | Horme, | \textbf{Fr.} | Gornostai, | \textbf{Rus.} | Hermelin, | \textbf{Gel.} | Armino, | \textbf{Sp.}

The prepared skin of a weasel, largely used by the wealthy of Europe and China.

ERNAAD, a naad or district on the western side of the Neihgherries.

ERRODE, or French rocks, 5 miles N. of Seringapatam, a military cantonment. It was a station for a French settlement in the time of Tipu.

ERTHA, the German goddess of the earth, whom Colonel Tod supposed to be the Hindu Eila. The German Ertha had her ear drawn by a cow, under which form the Hindu typifies the earth (Prithivi).—Tod's Rajasth. i. 574. See Euleius.

ERTOGHRIU, father of Usman, the founder of the Turkish empire. He was the leader of a little band, a fragment of a tribe of Oghuz Turk, which, under Ertogrul's father, Suliman Shah, had left their settlements in Khorasan, and journeyed for a time in Armenia. After a few years they left this country also, and were following the course of the Euphrates towards Syria, when their leader was accidentally drowned in that river. The great part of the tribe then dispersed; but a little remnant of it followed two of Suliman's sons, Ertogrul and Dukdar, who determined to seek a dwelling-place in Asia Minor, under the Seljuk Turk, Ala-ud-Din, son of an old chief. The adversaries, from whose superior force they delivered Ala-ud-Din, were a host of Mongols, the deadliest enemies of the Turk race. Ala-ud-Din, in gratitude for this eminent service, bestowed on Ertogrul a principality in Asia Minor, near the frontiers of the Bithynian province of the Byzantine emperors. The rich plains of Sagota along the left bank of the river Sakaria, and the higher district on the slopes of the Ermeni mountains, became now the pasture-grounds of the father of Othman. The town of Sagota or Segut was his also. Here he and the shepherd-warriors who had marched with him from Khorasan and Armenia, dwelt as denizens of the land. Ertogrul's force of fighting men was largely recruited by the best and bravest of the old inhabitants, who became his subjects; and still more advantageously by numerous volunteers of kindred origin to his own. The Turk race had been extensively spread through Lower Asia long before the time of Ertogrul. Quitting their primitive abodes on the upper steppes of the Asiatic continent, tribe after tribe of that martial family of nations had poured down upon the rich lands and tempting wealth of the southern and western regions, when the power of the early kialis had decayed like that of the Greek emperors.

ERU. Hind. Minoru.

ERYKA BOW. This and E. Javanica and E. scandens of Jussieu grow up to 3000 and 4000 feet in the N.W. Himalaya. The flowers have a sweet fragrance, and the woody fruit is used for stuffing pillows.—Stewart.

ERYUKU, also called Erkal, Yerkalvadu, Erika-ud, and Yerakelli, a homeless migrating tribe in the Peninsula of India, occupying themselves ostensibly as basketmakers and in fortune-telling.
But they are notoriously predatory, and steal girls, whom they devote to prostitution. They are found in mat huts on the outskirts of towns, in the border districts of the Teling, Tamil, and Cenarese countries.

ERYULAR, a Dravidian race occupying the skirts of the forests at the base of the Neigherry Hills. They dwell in the clefts of the mountains, and in the little openings of the woods. They arrange themselves into two clans, the Urali and Kurutale, meaning rulers and serfs. The word Eurali means unenlightened or barbarous, from the Tamil word Eral, darkness, and is the term applied to them by their neighbours. They speak a rude Tamil dialect. They sacrifice he-goats and cocks to Mahri, their deity, which is a winnowing fan; and they have minor deities, mere stones, that they call Moishani and Konadi Mahri. They inter their dead in great pits, 30 or 40 feet square, thatched over and planked across, with an opening about a cubit square in the centre of the planking. Across this opening are laid pieces of wood, on which the dead are placed, and covered with earth, and are left so till another person die, when the former remains and the earth are turned into the pit, and replaced by the newly dead. They are in small scattered communities, practising a rude system of agriculture, which scarcely furnishes them with sufficient food. They make use of animal food of every description, even vermin and reptiles. They collect the jungle produce. They hunt and take game of every description, with great cunning and audacity. The other Neigherry Hill tribes do not recognise the Eural as inhabitants of the Blue Mountains, and do not hold much converse with them. The following is the result of the weight and measurements of an average of 25 men, age 26-68 years:

<table>

They are superior in physique to the Kurumbar, and in some respects even to that of the Kotar. They do not recognise the Toda as lords, nor do they pay them good. The women are strong and stoutly built, and very dark skinned. Their feet, of all the S. Indian races, are the most beautifully formed. They wear heaps of red and white beads about their necks, thin wire bracelets and armlets, with ear and nose rings. The women wear a double fold of a wrapper cloth, which extends from the waist to the knees; the upper part of their bodies, with their bosoms, are nude.

At one time the Eural rarely held communication with the other natives, living isolated lives in secluded places and unhealthy localities, and eking out a precarious existence. Their villages were small, seldom exceeding five or six huts, and cattle pens scattered far apart, mostly located in groves of plantain and other fruit trees, and built somewhat after the Kurumbar huts, surrounded by the usual filth and dirt. They are more numerous in the southern than in the eastern parts. But of late years they have improved wonderfully, by mixing with others and taking employment on plantations, and working by side by side with other natives. They give satisfaction to their employers.—Dr. Short, E.G.S.

ERYTHRINA ARBORESCENS.

ERYTHRINA, Erythrina hirsuta. Willd. Lentil.

This is found in the Sutlej valley, between Rampur and Sungnam, at an elevation of 5000 feet, grows in corn-fields in northern India, and is cultivated for fodder.——Clegborn.

ERYTHRINA LENS. Linn. The lentil.

Adas, Aâr, | Arab. Masur parupsa, | Tam. Chiri sangalda; | Tel. Marsura, | Sansk.

This pulse is grown all over India, and is eaten as a dhal in food, but is said to be heating, and to cause eruptions if too much indulged in. By a slight change, Erythrum lens became the Evaletum; and another person, with another little change, sold the same article as Revalenta, adding the term Arabic to denote its Asiatic origin. Its flour is now used all over England by all classes to make a good wholesome soup without meat, though meat, soup, and vegetables can be added. The knowledge of this has rapidly spread.

Stewart; Hogg.

ERYTHRINA CAMPESTRE of Europe grows in Kashmir and Kashmir. E. giganteum and E. Perowskianum are ornamental garden plants, and E. planum grows in Kashmir.——Stewart; Honig; Riddell.

ERYSIMUM PERFOLIATUM is cultivated in Japan for its oil-seeds.——O. S. p. 187.

ERYsiphe taurica is one of the fungi of the Himalaya.

ERYTHRAS, son of Arius, a satrap of Phrygia. Erythras was banished by Darius to Kishin island, and Nearchus was told that Erythras had given his name to the adjoining sea.

ERYTHEAN SEA (Pliny, lib. vi. caps. xxxiii. and xxxiv.) was applied to the Indian Ocean, as well as to the two gulfs which it forms on each side of Arabia. Herodotus includes the Arabian Sea and part of the Indian Ocean under the generic name of Erythraean. And Pliny styles the Persian Gulf a bay of the Red Sea. Greek and Roman authors, however, generally used the term Persian Gulf; but it appears also among them as the Babylonian Sea and the Erythrean Sea, and this has caused a confusion with the Red Sea. The Persian Gulf by many is described as the Green Sea, also in Eastern manuscripts as the Sea of Fars or Pars, of Oman, of Kirman, of Katis, of Basrah, deriving these and other names from the adjoining provinces and remarkable places on its Arabian and Persian coasts. See Red Sea.

ERYTHROXYLUM, a genus of tropical trees and terebinthaceous herbs, with clusters of very large, long flowers, which are usually the brightest red, whence their name of coral trees. Moore, when describing the Indian islands, notes the.

'Gay, sparkling loories, such as gleam between
The crimson flowers of the coral tree
In the warm isles of India's sunny sea.'

Frequently their stems are defended by stiff prickles. Voigt notices 11 and Gamble 8 species as known in India.——Voigt, p. 287.

ERYTHRINA ARBORESCENS. Roxb.

Purulaa, | Bras. | Gul nall dar, | Panji, Thab.
| Girmah, | Gilur, Gadorwa, | Ravi, | Gu, nam.
| Panji. | Budara, | Sutleri.

Grows up to 7000 feet in the Outer Himalayas,

1054
from the Ganges and Bhutan, also in the Khassya Hills; wood spongy.

**ERYTHRINA INDICA.** Lam. Coral tree.

**ERYTHRINA INDICA.** Lam. Coral tree.

**ERYTHRINA INDICA.** Lam. Coral tree.

**ERYTHRINA MODICA.** Benth. & Hook.; K. and B.; Eng. Ker. This is the large tree of all India and the Archipelago, flowering at the beginning of the hot season, its seeds ripening in June and July. Its place in the forests is generally taken by *Erythrina subemarginata*. It supplies a soft white wood, as easily worked as the pine, commonly used for light boxes, scabbards, children's toys, rafta, fishermen's floats, and is hollowed out and made into canoes. The wood used for this purpose in Upper Hindustan is the Bombax eculus. This is the Muchi wood of Madras, and the varnished toys from the Northern Circars are made of it. For sword scabbards it is a first-rate material. It is eaten by white ants eagerly. This tree is employed to support the black pepper vine, being of quick growth from cuttings, with firm, permanent, smooth bark, which never peels off, and gives firm hold to the roots of the vine, and they are full of leaves and very shady during the hottest months of the year, which shelters the vine from the intense heat of the sun, and keeps the ground moist. As soon as the hottest weather is over, the leaves drop, and expose the vines to the sun and weather during the cool season.

**ERYTHRINA RACHYACANTHA.** Roxb. This is a large tree very common on the western side of the Madras Presidency; the wood, as in all the other *erythrainas*, is soft, light, and spongy. It is employed as a substitute for deal, is much in use in the manufacture of toys, trunks, etc., and is afterwards varnished, its large pores admitting and retaining the varnish better than almost any other wood; the wood is not liable to warp, contract, or split. It is also used for the scabbards of weapons.

**ERYTHRINA SUBEROSA.** Roxb. Muni, Motaia, . . . TAM. ; Modugas, . . . Tel. A small tree of all India, growing in every soil and situation; leaves deciduous during the cold season. Flowers in February and March, soon after which the leaves appear; the trunk is generally crept from 8 to 12 feet to the branches. The trunk is covered with deeply cracked, corky bark. It is famed for its wood and is used by the Tartars in 1241. It is the capital of the pashalic which bears the same name, and is about ten days' journey from the Persian frontier. It is built on an elevated plain about 6000 feet above the level of the sea. The soil there is, in December, and lasts usually from September till May. Lying on the high road from Persia to Constantinople, it is the resort of many merchants and caravans; but it has not recovered the Russian occupation in 1829, when its fortifications were dismantled, and many of its most opulent and industrious inhabitants, the Armenians, were in-
danced to emigrate. One of the branches of the 
Euphrates flows at a short distance below the city. 
ES or CEs, according to the translator of the 
Eddas, is the name for God with all the Celtic 
races. So it was with the Tuscanis, doubtless 
from the Sanskrit, or rather from a more pro-
vincial tongue, the common contraction of Esu-
wur, the Egyptian Osiris, the Persian Syr, the sun-
god. Thor is called Asa Thor, the Lord Thor; 
and Odin is also called As or Lord; the Guals 
also called him CEs or Es, and with a Latin ter-
mination, Hesus, whom Lucas calls Eams. Eswara 
is a usual title of Siva.—*Edda*, ii. pp. 45-6; *Tod's 
Questions*, p. 567.

ESKAHIL, an Afghan tribe on the Pan-
jub frontier, who, along with the Shahi Turis and 
the Jaji, dwell on the daman or skirt of the 
Sullimani range. The Esa Khail occupy the 
banks and islets of the Indus in a valley contain-
ing 45 villages. It is a narrow oblong strip 
between the Indus and a long spur of the Khuttak 
range, that runs southward into the plain.— 
Rec. Gort. of India, No. 11.

ESCHICHOLTZIA, one of the Papaveraceae, a 
very beautiful, very delicate little flower, of a 
deep yellow orange colour. E. cristata, *Tatarine*
, the Hiang-ju of the Chinese, is a fragrant plant of 
China.—Smith: *Richbell*.

ESCUAPUS, amongst the Greeks and Romans, the 
deified mortal to whom the care of 
medicine and health pertained. Esum, the 
snake-god of the Phoenicians, is identified by 
Bunsen (iv. p. 259) with the Egyptian Hermes, 
called Tet and Taantes in Phœnician. Esum is 
strictly a Phœnician god. He was especially 
worshipped at Berytus. At Carthage he 
was called the highest god, together with Astarte and 
Hercules. At Babylon, Bel corresponded with 
him. According to Jamblichus and the Hermetic 
books, the Egyptian name of Esclapius was 
Kamoph (Bunsen, iv. pp. 256-7). The Aswini-
Kumara, the sons of Surya, amongst the Hindus, 
correspond with the western Greek and Roman 
Esclapius; but Dhanwantari, a physician, is also 
the analogue. The Esculapian rod has been sup-
posed by some to be a stem of a Bambina plant. 
It is probably, however, the form serpents assume 
when in congress, and which is represented at 
every Hindu serpent shrine. The Hindu Escu-
apius has no rod.

ESDAILE, Dr., ob. 1859 at Sydenham, a 
Bengal medical officer, the eldest son of the Rev. 
Dr. Esdaile, was born at Monrose 6th February 
1808. He devoted himself to the study of 
mesmerism. His first trial was casual. Seeing a 
felon in agony after a surgical operation, he 
thought he would try to mesmerize the sufferer, 
who presently exhibited the phenomena which 
were witnessed in England. After this time Dr. 
Esdaile performed a very large number of surgical 
operations some of them absolutely gigantic  
without pain. In 1846 he removed 21 tumours, 
some weighing 50 lbs., one 40 lbs., and one 112 
lbs.; in 1847-18, one of 40 lbs., and another 
of 100 lbs. in weight; in 1848, 34, some of very 
great size and weight. In 1848 he removed 10 
some very large. In 1849 he performed 62 capital 
or operations. After 100 capital operations, with 
insensibility, only two patients died within a 
month, one from cholera, and the other from 
lock-jaw.

ESKAR. *Can.* A village servant. 
ESPARTO, a valuable paper material of N. 
Africa, in use since the middle of the 19th cen-
tury. See Stipa.

ESSENIANS, a sect amongst the Hebrews, who 
every day saluted the rising sun. 
ESSENTIAL OILS, called also volatile oils, the 
Atr of the Arabs and Hwa-lu of the Chinese, 
are obtained from various parts of odoriferous 
plants, chiefly by distillation, but also by the 
chemical perfuming process of enlithering. The 
best known volatile oils are those of almonds, 
asied, bergamot, cajaputi, chamomile, camphor, 
caraway, marjoram, cinnamon, citronelle, cloves, 
juniper, lavender, lemons, lemon-grass, mint, 
nutmeg, orange, peppermint, pimento, rhodium, 
rosemary, roses (otto), savine, sassafras, mint, 
but in India, sandal-wood, jasmine, nutmegs,  
indeed, every odoriferous plant is by the perfumers 
made to yield perfumed oil. The chambelli-kia 
of Lucknow, extracted from the petals of 
Jasminum grandiflorum, sells at 2 rupees per 
tola. This plant is extensively cultivated in 
gardens in Lucknow for the sake of its flowers. 
Motiah or Belak-kia-atr of Lucknow, Jasminum 
sambac, also extracted from the petals, sells at 
2 rupees per tola. It is cultivated extensively in 
gardens in Lucknow for the sake of its flowers, 
and is coloured red by means of dragon's blood. 
The essential oils of cinnamon, citronelle, and 
lemon grass are made chiefly in the neighbour-
hood of Gallic, in the southern provinces of 
Ceylon. The oil of cinnamon is also made largely 
at Colombo from the broken or inferior pieces of 
bark rejected in packing the bales of spice. 
The Andropogon muriatcum, Jasminum grandiflorum, 
J. sambac, Lawsonia inermis, Pandanus odorat-
tissimus, and the rose flowers are all utilized. 
Common mustard oil is often scented with mall-
agussa, and sold as an essential oil. See Atr; 
Oils; Otto.

ESTHER. In the centre of Hamadan is the 
tomb of All bin Sina (Avicenna), and not far 
from it are those of Esther and Mordecai, which 
are held in great veneration by the Jews of 
the town, and kept in a perfect state of repair. 
On the dome over these tombs is an inscription to 
the effect that Eliaz and Samuel, sons of Kachan, 
finished building this temple over the tombs of 
Mordecai and Esther on the 15th of the month 
Adar, 4474. The tombs are made of hard black 
wood, which has suffered little from the effects of 
time during the 114 centuries they have existed. 
They are covered with Hebrew inscriptions, still 
very legible, of which Sir John Malcolm has 
given the following translation:—*At that time 
there was in the palace of Susa a certain Jew of 
the name of Mordecai; he was the son of Jair 
of Shime, who was the son of Kish, a Benjamite, 
for Mordecai the Jew was the second of that 
name under the king Ahasuerus, a man much 
distinguished among the Jews, and enjoying great 
consideration amongst his own people, anxious 
for their welfare, and seeking to promote the 
peace of all Asia.’ The traveller, unless told, 
would never recognize them as tombs. The entry 
is by a low door, and the tombs occupy the whole 
of the internal space to the ceiling, leaving 
only a very narrow passage for walking round 
the huge stone-like construction in the middle. 
Literally not an inch is left on the whitewashed
walls on which the Jewish pilgrims of a thousand years have not inscribed their names.—Ed. Ferrier, Journ. p. 37.

ESWARA, a title of Siva, who is also styled Mahadeva, the great god; Maheswara, the great lord; Bhuvananwara, the lord of the earth; Brahmswaro, is the lord of lords, or the lord of the first creative energy. See Es.

ETA, an unclean race in Japan, curriers, tanners, about three millions.

E.TAH, a revenue district in the North-Western Provinces of India, lying between lat. 27° 0' 45" and 28° 1' 39" N., and long. 78° 27' 20" and 79° 19' 23" E. Area, 1512 square miles; population in 1872, 703,527. From the 6th to the 10th century, Etah appears to have been held by Ahir and Bhar, and then to have been occupied by the Rajputs. The Rajputs are 57,025, the Banyas or trading castes, 13,056. The Chamars are the most numerous tribe, forming the landless labouring class throughout the whole Doab.—Imp. Gaz.

ETAMU. Tel. Pikota, Tam. A lever for raising water.

ETAWAH, a revenue district in the North-Western Provinces, lying between lat. 26° 21' 8" and 27° 0' 25" N., and between long. 78° 47' 20" and 79° 47' 20" E. Area (1878), 1619 square miles; population (1872), 668,641 persons. The Chamars, 96,923, are agricultural labourers; Ahir, 75,035, come next, and have some landed property of small value.—Imp. Gaz.

ETHER, the air, the atmosphere. In India, amongst the Aryan Hindus of the Vedic times, adoration was offered to Ether as Indra (Zeus), with the sacrifice of milk and the fermented juice of plants. See Elements.

ETHER, medicinal substances obtained by distilling alcohol with an acid. There are several others; they are very inflammable.

ETHERSEY, Lieut., Indian navy, in 1834-36 made an excellent but incomplete survey of the Gulf of Cambay; and the coasts to the westward were surveyed by Lieuts. Whitelocke and Constable and Mr. Jones. Between 1844 and 1852, Lieuts. Saunders, Rennie, Taylor, Constable, and other officers, surveyed other portions of the west coast, and Lieut. Selby completed the off-shore soundings on the west coast.

ETHIOPIA, a country mentioned in the Scriptures, corresponding to the present kingdoms of Nubia and Abyssinia. It was also called Saba, also Meere. It was at one time occupied by Arabs, under a settled form of government, who corrupted Nubia and harassed the Thibans. During the earlier Christian centuries the Arabs were conquered by the Egyptians.—Sharpe, i. 101.

ETREK, a considerable river, about 300 miles long, which drains a wide valley lying between two ranges of hills. It runs nearly N.W. from near Meshed to the Caspian Sea, into which it discharges at its E.E. corner. Its lower course is through wide and fertile plains, over which the Yomut Turkomans roam. They have a village on the left bank.—Collett, C. As.

ETWAR. Hind. Abbreviation of Adityavara, Sunday.

ETYMANDER, of the classics, is the river Helmand.

ETZEL, known to Europe as Attila, was the leader of the Hiong-nu, a pastoral tribe who had been expelled from the borders of China by the powerful dynasty of Han, and formed one of the tribes who roamed in the lands from the Altai to the walls of China. The Hiong-nu, after their inroad on the Gothic empire of Hermanrich, made their way, under Etzel, into the heart of France. Hordes from the same regions, under Togral Beg, and Seljuk, and Mahmud, and Chengiz, and Timur, and Othman, have since then overwhelmed the khilafat and the empires of China, of Byzantium, and Hindustan; and lineal descendants of the shepherds of High Asia still sit on the throne of Cyrus and on that of the great Constantine.

The eucalyptus, a genus of trees, is found in Australia, where the numerous species occur in great profusion, and, with the leafless acacia trees, give a most remarkable character to the scenery. Several eucalyptus have been introduced into India, and are growing on the Neilgherry Hills. Their Australian names—blue, grey, spotted gum trees, etc., iron-bark, stringy bark, blood-wood, box, peppermint, swamp ash, mahogany trees, etc.—are terms which vary in each district. Many of them yield a timber tougher and more durable for shipbuilding than either oak or teak, and not liable to injury from salt water or white ants. An essential oil is extracted from the leaves of one variety, the E. robusta, which was pronounced not unlike cajaputi, and very fragrant. All the varieties tried on the Neilgheries have succeeded, on every description of soil, from the swamp to the poorest clay, at all elevations, but also with a rate of growth little short of miraculous, viz., a foot per mensem, whereas hard woods in Britain progress at the rate of one foot annually. Householders on the Neilgheries are now covering their compounds with the eucalyptus, and with that pretty Australian favourite the Acacia melanoxylon, which is so invaluable as a source of fuel; for, like the perennial grasses, the more it is cut the better it grows. E. acmenoides, amygdalina or white peppermint tree or ash tree, botryoides, calephylla or red gum tree, citriodora, coriacea, cornuta or yate tree, corymbosa or blood-wood tree, diversicolor or karri, doratoxylon or spear tree, Eugeniodes, ficifolia, globulus or blue gum tree, gomphocarpa or toosar, gomioalyx, Gunnii, hephalena or box tree, leucoxylon or iron-bark tree, lexephelea or York gum tree, macrorhyncha or stringy bark tree, mancutula or spotted gum tree, marginata or jarry or mahogany tree, melanoplia or iron-bark tree, meliodora or yellow box tree, microcorys or stringy bark tree, microtheca, obliqua or stringy bark tree, olecea or mallee, paniculata or white iron-bark tree, phoeicis, pilularis or black butt tree, posthlyphra, polyanthemus or red box, ravertiana grey gum tree or iron gum tree, reduca or white gum tree, resinifera, robusta, rostrata or red gum tree, salmonoplia or salmon-barked gum tree, saligna or white or grey gum tree, salabris or ginnala, wood or fluted gum tree, sideroxylon or wooria or white iron-bark tree, Stuartiana, tereticornis or red gum tree, terminalis or blood-wood tree, tesselaria, virgata or manna gum tree, viregata or stringy bark tree. The useful products to be obtained from these trees are very numerous, and include, in addition to timber and potash, oils, tars, acids, dyes, and tans.

E. globulus has acquired a high reputation for rendering habitable localities which were previously

3 x 1057
the unhealthy seats of malaria. In Algeria and Portugal are valleys which only a few years since were most unhealthy, but which have been rendered salubrious by the planting of some of these trees; while a striking example of their fever-preventing properties is furnished by the re-planting of a deserted cluster of vineyards in the midst of the Ostia, in the Tuscan seaboard, where some thousands of the inhabitants are said to have been cured of yellow fever. — Wallis, p. 389. See Beetles; Insects.

EUCHARIS, a genus of beetles, one of the Lamellioseous, said to have similar habits to its congener Lecanus cervus. Euclirrus longimana, the long-armed chaffer of Ambonya, drinks the sap of the sugar palm. It is a sluggish insect. — Wallace, p. 329. See Beetles; Insects.

EUCHEUMA LUXURIANS. Durien. Afodder grass of Guatemala; has been introduced into Northern India.

EUCRATIDES, a Bactrian king, B.C. 185, who ruled over Bactria, Ariana, Patelian, Syrastrene, Larice, Nisa, Gandharitis, Puekhelots, and Taxila. While still ruling, Antimachus Nicophorus seized part of his dominions, and, after the parricide murder of his Heliocles of Eucratidés, his countries remained in the hands of Antimachus Nicophorus and Apollodotus. The Āryan was held as a character adopted first on the coins of the Greek kings, from Eucratidés down to the barbarian king Hermaeus. Eucratidés was the earliest of the Greek Kings of Bactria, Kabul, and Arya who adopted bilingual inscriptions on his coins. It is supposed he did so consequent on his conquest of the Paropamisus after the annexation of the title of Great King. On his murder by his son Heliocles, his wide dominions are supposed to have been broken into several independent kingdoms. His parricide son ruled for a few years over Bactria and Paropamisus, under the title of Eucratidés B.C. According to Cunningham (Hist. Panj. i. p. 57), Eucratidés invaded India B.C. 165, and annexed the Panjab southwards to Patala, in Sind, the modern Hyderabad, which he destroyed fell to Memander or Apollodotus. A list of kings, he says, had been obtained from recently discovered coins, of Greek origin, bearing Aráyan inscriptions on the reverse, ranging from 150 to 120 B.C., who are supposed, upon good grounds, to have been sovereigns of the Panjab, the valley of the Indus, and Kabul.

— Thomas Prinsep; History of the Panjáb, i. p. 57.

EUDEMOS, a Greek ruler in the Panjab, who, along with Taxiles and Porus, was named by Alexander to succeed Philip, on the murder of the latter by the mercenary soldiery. The Greek colonists in the Panjab had first been placed under Philip, while the civil administration remained in the hands of Taxiles and Porus. After Alexander's death in B.C. 323, Eudemos made himself master of the country by the treacherous assassination of king Porus. A few years later, in B.C. 317, he marched with 3000 infantry and 5000 cavalry and 120 elephants, to the assistance of Eumenes, and did good service at the battle of Gabiene, but during his absence Chandragupta roused the nation, and slaughtered and expelled the Greeks. See Chandragupta.

The male bird is greenish black through and the female is glossy dusky green, spotted with white above. Like the cuckoo, the koil lays its eggs in the nests of other birds. The nest of the seven brothers, the saithi, is selected occasionally, and it is a curious sight to see these social birds unitedly feeding the young koil that has been hatched in their nest. Because the koil's song is especially heard at the season of spring, it is called the friend of love—
EUGENIA CYNTHIACANTHA. 

EUGENIA TRISTIS, Griff., and E. truncata, Griff., Bartam, Malay, palms growing on the hills about Ching, Malacca, and Penang. E. truncata, Griffiths, is a stemless palm, growing in thick tufts, which are surrounded by the debris of the old leaves. Leaves numerous, the outer ones spreading, fifteen to twenty feet in length. It is very common, and in Penang is much used in making mats for sides of houses, for thatch, and for the same purposes as those of Nipa fruiticans.

- Griffiths' Palms.

EUGENIA, a genus of plants named in honour of Prince Eugene of Savoy. It still contains nearly 200 species, though numbers have been removed to the genera Nelitris, Jossinia, Myrcia, Syzygium, Caryophyllus, and Jambosa, in which are now contained the clove-tree, the rose-apple, and jamoon of India, formerly included in Eugenia. This genus is confined to the hot and tropical parts of the world, as Brazil, the West Indies, Islanda, and Sierra Leone, and extends from the Moluccas and Ceylon in the south to Sylhet and the foot of the Himalayas in the north. Some of the species secrete a warm volatile oil in their herbaceous parts, abounding in tannin, yield good wood, and a few have fruits which are edible, though not very agreeable, from being impregnated with the aroma of the oil. Dr. Wight gives, in his Icones, 66 species of the E. Indies; and Duthie and Gamble name 77 species. Dr. Thwaites enumerates several species in Ceylon. The generally accepted names of the species are—

acuminata. 
balibora. 
alternifolia. 
amplexicaulis. 
angusta. 
areolata. 
argentea. 
argyrophylla. 
asclepias. 
hemisphérica. 
Heyneana. 
inophylla. 
jambo. 
Jambolan. 
Javanica. 
Jossinia. 
Khasiana. 
Kerr. 
Kunth. 
lacte. 
lanceolata. 
leucophylla. 
liptosperma. 
Aphyllos. 
microcarpa. 
microserpula. 
Malabaria. 
Malaccensis. 
Malaya. 
Mooreana. 
Moringa. 
Mori. 
Moro. 
Myrtifolia. 
Nerur. 
notabilis.

EUGENIA ALTERRIFOLIA. 

EUGENIA CARYOPHYLLATTA. Thu. 

Caryophyllus aromaticus. 
Myrtus caryophyllus, S. 
Lavanga. 
E. caryophyllus, tab. 294. 
E. multiflorus. 
E. nucifera. 
E. caryophyllifolia, Lam., Wight Icones, 553. 

EUGENIA JAMBOLANA. 

Lam., Rox. 

E. fruticosus, tab. 294. 
E. nucifera. 
E. caryophyllifolia, Lam., Wight Icones, 553. 

EUGENIA JAMBOLOANA. 

Lam., Roxb., W. Ic. 

The clove tree of the Moluccas, cultivated in Ceylon, the Malay Peninsula, in the south of India, in Travancore, also in Mauritius and Bourbon. The clove (laung karanful) of commerce are the unopened flowers, the flower-buds. It is hardly found on the Bombay side north of the Savitree. South of that river it is found only in Resses or greenwood jungles, and about temples. The wood appears quite equal to that of the common jambul, the Eugenia jambolana.—Roxb.; Gibson; Voigt.

EUGENIA CARYOPHYLLIFOLIA. 

Roxb. 

Calyptranthes caryophyllifolia, Ains. 

Chote jam, 
Beng. 
Nawal maram, 
Tam. 
Thab-yeh-ga. 
Birm. 
Neredu manu, 
Naradil Vriha. 
TAN. 

It is a native of various parts of India, growing luxuriantly in almost every soil and situation. Flowering time the hot season; bears a round berry, black when ripe, the size of a pea. The wood is very strong, close-grained, hard, and durable.—Roxb.

EUGENIA CYLINDRICA. 

W. Ic. 

Jambosa cynthia, Thu. 

In flower, a middling-sized Ceylon tree, section Jambosa, very beautiful, at 3000 feet elevation.—Beedle.

EUGENIA FLOCCOSA. 

Bedd. 

This is a good-sized and most beautiful tree, section Eugenia, very common in the dense moist woods on the South Tinnevelly ghat above Calcut, at 3000 to 4000 feet elevation, flowering in August and September.—Beed. Flor. Syl.

EUGENIA FORMOSA. 

Wall. 

An evergreen moderate-sized tree of the Sub-Himalaya and Tenasserim, with very handsome large flowers and large fruit.—Wall.

EUGENIA HEMISPHERICA. 

W. Ic. 

A very handsome, large tree, is common in the mountain forests from South Canara down to Cape Comorin at about 3000 feet elevation; is abundant in Coorg, the Animalays, and Tinnevelly ghat, and is also found in Ceylon up to 4000 feet. The timber is used for a variety of purposes.—Beddome.

EUGENIA JAMBOLANA. 

Lam., Roxb. 

Syzygium jambolana, D. C., W. I., W. Ill., W. and A. C. s. caryophyllifolium, D. C. 
Eugenia caryophyllifolia, Lam. 
Calyptranthes jambolana, Wildc. 
C. caryophyllifolia, Wildc. 
Myrtus cuminii, Linn. 

Kalo jam, 
Beng. 
Kotti nagar maram, Tam. 
Rajamun, Jambool, Hind. 
Pula, Neredu, Naranagull, Tam. 
Pera-nagal, Sina-nagal, Tam. 

It grows in Coimbatore, Ganjam, Gumsur, Bengal, and Kamaon. About Madras this tree is generally much destroyed by the carpenter bee. Dr. Gibson says the wood makes excellent beams, but on account, probably, of its brittleness, is never cut up for cabinet purposes. The bark affords a large supply of a kino extract.—Dr. Wight, Gibson, Voigt, Claybro; Captain Macdonald.

EUGENIA JAMBOLANA. 

Lam., Roxb., W. Ic. 

E. fruticosus, tab. 294. 
E. nucifera. 
E. caryophyllifolia, Lam., Wight Icones, 553. 

Syzygium jambolana, D. C. iii. 259. 

Jambool, 
Beng. 
Maddan, 
Sing. 
Narala, 
Can. 
Nawal, Nawar, 
Tam. 
Jamun, 
Hind. 
Naregar, 
Tel. 

This large and beautiful tree is found almost everywhere throughout the plains of India, whereas most of the other species affect the mountains. It is much planted in trees and avenues in the Madras Presidency, but it ascends the mountains to 4000
or rarely 5000 feet elevation. It is also indigenous in the Archipelago and in Australia. The bark is strongly astringent, and dyers excellent durable brown, and it yields an extract like the gum kino. The jaman fruit is eaten; and that from some of the larger fruiting varieties (when it is as large as a cherry, or much larger) is very agreeable. The fruit of the very small fruiting variety (E. caryophyllifolia, Lam.) is not eaten, and is not larger than a pea.—Beddome, p. 197.

EUONYMUS MALABARICA, Bedd., is very common in the Wynn in Malabar, at 2000 to 4500 feet elevation, generally in swampy places, and also occurs in the Animalias.—Bedd. Fl. Sylc.

EUONYMUS ZEYLANICA. Wight, Ill.

This tree is of the Aecema section of Eugenia. It is common on the South Tinnevelly mountains up to 3500 feet, where it generally affects beds of rivers, and in Ceylon, where it is called morang; it is very beautiful when in full flower.—Bedd. Fl. Sylc. p. 262.

EU-HO, called also the Yun-lian-ho, a river of China, a tributary of the Pei-ho river. At the junction is the town of Tien-taing-fu, a place of great trade.

EUOPHIA CAMPESTRIS, Lindley, is found in Oudh, Rohilkhand, in the Siwaliks of the Gangetic Doab, and in low land by the Ravi, close to Lahore. E. herbacea, Lindley, occurs in Southern India and the Outer Himalaya, near the Jumna; and E. vera, Royle, occurs near the Jhelum river, in the Panjub, Himalaya. The tubers of all three are used as selap.—Dr. J. L. Stewart.

EUOPHIA VIRENS. R. Br.

Limodorum virens, Roxb.

Khassiat us Salih, ARAB. Goru chettu gadda, Tel. Whitlow root, _Eng_. Raye duru dumpa, Sake; Salep misri, _Tel_. Orka, Sataryum, YUNAN. Verdularu gadda, _Tel_. Turphylla, . . .

The tubers form part of the saleb misri or salep of commerce. Most of the rhizomata of the family Orchidaceae yield starch in a peculiar form, and are used under the name of salep as an article of diet. The same use is made of the rhizomata of the species of Eulophia.—_Lindley; Birdseed; Hoggy; Voigt, 629._

EUMETA CRAMERII. Westc.

Sack trager, _Ger_. Kundi puchi, _Tam_. Dalmo-kattea, _SINGH_. Muluka rasari, _Tel_.

This is one of the wood moth’s or wood carriers of Ceylon. The insect gathers a bundle of thorns or twigs about it, binds them together by threads so as to form a case. The male, at the close of the pupal rest, escapes from one end of the case, but to the females it is a covering for life. Another species is _E. Templetonii._—_Tennent’s Ceylon._

EUNUCH.

Eunique, . . . _Fr_. Eunusco, . . . _Sp_. Verechitstiane, _Ger_. Khadam, . . . TURK. Khajah, Khoja, _HIND_.

Eunuchs are employed in the households of the Mahomedans and Hindus of Egypt, Persia, Arabia, India, and China. We learn from Herodotus (lib. 6) that the Persians in remote times were waited upon by eunuchs, and some attribute to them their introduction. Ammianus Marcellinus (lib. 14) ascribes the origin to Semiramis. Burton says that they are unknown in Arabia at the time of Mahomed; but in the chapter of the Koran on Nur or Light, men who have no need of women are spoken of as persons before whom women may appear; the learned, however, do not agree as to who these were there meant. Burton also (Pilgrimage, ii. 74 to 155) mentions eunuchs coming to the prophet’s tomb. Nearly all the slave-hunters in Abyssinia, when they catch a young lad, mutilate him completely, and send them over to Mecca; and lads are still said to be mutilated in Rajputana and in Aurangabad. Dr. Wolff (Bokbara, vi. p. 217) mentions that in his time several of the eunuchs were married to several wives, and he instances Manujar Khan, the governor of Isfahan; others of them have wives. Sir John Malcolm had known only two or three instances of eunuchs being employed in situations of trust during the reign of the king of Persia, to whom he went as ambassador. He, however, observed that they were treated with uncommon attention and deference. In Hyderabad, in the Dekhan, eunuchs are few. Eunuchs in India have the title of Agha, also of Khajah, or Khojah. The eunuchs employed in the imperial harem of China sometimes rise to positions of eminence.—_Malcolm’s Persia_, ii. p. 438, 155, n.; _Burton’s Mecca_, iii. p. 408.

EUONYMUS, a genus of plants belonging to the natural order Celastraceae. About thirty species, mostly small trees, are known to occur, in the south and east of Asia. _E. cinnabaris_ of Nepal is a shrub or climber. _E. glaber_ occurs in Chittagong; _E. grandiflorus_, and _E. Hamiltonianus, Wall._, in the Dehra Doon; _E. grossus_ in Nepal; _E. dioctotonus_; _E. Goughii_, and _E. acutangulus_, in the Peninsula. In Japan are _E. japonicus_, _Sieboldianus_, _Thunbergianus_, _subfruticosus_, _Hamiltonianus_, _latifolius_, _Roxb.; Voigt._

EUONYMUS CRENULATUS. Wall. A small tree, common on the Neighberges, Pulneys, and higher parts of Western Ghats of the Madras Presidency. The wood is white, very hard and close-grained, and answers for wood engraving, and is about the best substitute for boxwood in the Madras Presidency; the wood of the other species is very similar.—_Beddome, Fl. Sylc._

EUONYMUS FIMBRIATA.

Saki, Sikh, Papar, HIND. | Bar-phuli, Batal. | HIND.

Wood hard and useful; it is beautifully smooth and white.

EUONYMUS GARCINIFOLIA. Roxb. i. 628.

Nooce of. | NEPAL | Mori of. | STILLET.

A small tree, growing near the Bombay ghats in the upper country to the south. It seems to be often cultivated in Canara, on account of its straightness, as applicable for house rafters. It does not reach a size sufficient to fit it for general purposes.—_Beddome._

EUONYMUS JAPONICUS, the Tu-chung and Muh-mien of the Chinese. It grows in Honan, Shen-si, and Shan-si. The leaves are eaten when young; fruit is astringent; wood used for making pattens. On breaking the bark, a delicate, silvery, silky fibre is seen.—_Smith._

EUONYMUS REVOLUTUS. Wight, Ill. A middle-sized tree of Nawara and other very elevated parts of Ceylon.—_The._

EUONYMUS TINGENS. Wall. The bark in the inside is of a fine yellow colour, similar to that of rhamnus. It is used to mark the tika on the forehead of the Hindus, and is considered by the natives to be useful in diseases of the eye.—_Rogly; O’Sh._
EUPATORIUM TRIPLINEERVE.

EUPATORIUM TRIPLINEERVE. Vahl.
E. ayapanasc, Vent. | E. aromaticum.

Ayapana, | BENG., HIND.

The dried leaves and twigs are used in medicine. An infusion is a very agreeable diaphoretic and mild tonic, and is a favourite remedy among the native practitioners. There are several exotic species, E. Guaco, E. odoratum, E. perfoliatum, and E. rotundifolium, or bone-set, is possessed of greater bitterness and less aroma than E. triplinerve, and is stated to be employed with much success as an antipertussive in the intermittent fevers of the United States of America.—O'Sh.

EUPHORBIACEAE, the Euphorbium tribe of plants, consists of trees, shrubs, or herbs, many of them abounding in an acrid juice. The number of species has been estimated at 1500, and Dr. Roxburgh describes 120 in India. The general property of this order is that of exciting, varying in degree from mere stimulants to the most dangerous poisons. The application of heat is sufficient to destroy the stimulating principle, as seen in the instance of the Jatropha manihot or cassava, which when raw is poisonous, but when roasted becomes a nutritious article of food. A caoutchouc, tursoil, and farliyun are useful products of the order. The more important genera in the East Indies are agynes, aleurites, acalypa, Bridelia, buxus, cercidostachys, coca, clauscia, croxophora, croton, codicium, cumbica, claconia, excocca, euphorbia, flugaea, glochidion, hura, jannipa, jathropa, macaranga, phyllanthus, plute- netia, poincetia, rotteria, ricinus, saphin, stipul- lingia, siphon, sarccococa, stylosicus, xylophylla. Williams says (Middle Kingdom, p. 107) that in China a strong oil is derived from the seeds of two or three plants belonging to the euphorbiaceaus family, for mixing with paint, smearing boats, etc. Voigt enumerates 31 species of Euphorbiium as known in India, viz.:
aculs. | ligularia.
antiquorum. | linearis.
arboreascens. | lophogona.
bojera. | maculata.
buplerfia. | mellifera.
chamaseyce. | nivula.
dracunculoides. | parviflora.
exigua. | peltata.
hirta. | pieta.
hoyafolia. | pieta.
lactea. | uniflora.

In February and March, women are to be seen wherever the milk-bush prevail. They apply the milk to their bodies and limbs, and then stick the places over with tufts of raw cotton. It produces a hot and slightly prickly feeling, and a small degree of blistering. It is considered good for the health, and is supposed to ensure fecundity. The exhibitions seen at this season, in applying the milk, are often indicative in the extreme. The Euphorbiurn plant is sacred with the Kachari. It is the represeatation of their goal Batho, and is worshipped by them.
The gum euphorbiurn plant of Morocco is the E. resinifera. The juice issues from incisions made with a knife. The people who collect the gum tie a cloth over their mouth and nostrils, as the small dusty particles produce incessant sneezing. The branches are used by the tanners, and to it probably the morocco leather owes its reputed pre-emience. Iron coated with the juice of some of the euphorbium does not rust, even though long immersed in water. To this end the gum is dissolved in spirits, and applied as a coating for ships' bottoms, and for ironwork generally, the spirits evaporating, and the gum being left on the surface of the metal. The composition has also been successfully tested in Africa against the ravages of the white ant.

EUPHORBIA ANTIQUORUM. Linn.

Eup. saj. | BENG., Tharu.
Nara sa. | HIND.
Shadra kalli, | MALAI.
Triangular spurge, | ENG., Shadre kalli,|

Euphorbia antiquorum. A common plant in the south of Asia. The inapposited milky juice of this species is said, in common with that of other succulent euphorbias, to produce the drug euphorbium. In India this is mixed with sesamum seed oil, and used externally in rheumatic affections, and internally in cases of obstructive constipation. It is worshipped by Hindus as Manusa, the serpent goddess.—Roxb.; Atinile.

EUPHORBIA CANARIENSIS. Linn.

Eup. saj. | BENG., Tharu.
Sudusudu, | MALAI.
Firfyoon, | Furbinne.,
Shia-dao, | MOCCOBO.
Sheer-darakh-zekoone, | ENG.
Canary spurge, | Pers.

In the Canaries, on volcanic soil, this and E. laphylla form great bushes, with arms like candelabras.

EUPHORBIA CATTIMANDU. W. Ell.

Eup. saj. | BENG., Tel.; Kattimandu, |

Euphorbia cattimandu. In Telugu, literally 'knife medicine,' because used to fix knives in wooden handles. The juice of this plant is used in Telugunga in cementing iron with other substances. At the Madras Exhibition of 1855, Mr. Elliot exhibited a basin, ewer, and tumbler made of cattimandu gum, moulded with the hand, without any preparation. The fresh juice is used as a vesicant.

EUPHORBIA CHAMESYCE. Linn.

Eup. saj. | BENG., Shek young.

Euphorbia chamesyce. Ti-kin, | CHIN. | Tsolbh-ri-nge-tan.,
Grows in Ch'uh-chau in Nган-lwu in China. Juice purgative; also applied externally in skin diseases.—Smith.

EUPHORBIA LATHYRIS.

Eup. saj. | BENG., Sudab.

Euphorbia lathyris. Spurage, | HIND.
Caper spurge, | Eng.

The seed of this euphorbium contains yellow fixed oil, stearine, acid brown oil, crystalline matter, brown resin, an extractive colouring matter, and vegetable albumen. The seeds purge, and cause violent vomiting; they are used in dropsy.—O'Sh. p. 565; Powell, i, p. 376.

EUPHORBIA LIGULARIA. Roeb.

Eup. saj. | BENG., Sha young.

Euphorbia ligularia. A plant sacred to Mums or Manusa, the goddess of serpents. The root, mixed with black pepper, is employed for the cure of snake-bites, both internally and externally.—Roxb. ii, 465; O'Sh.

EUPHORBIA LUNULATA. Smith.

Eup. saj. | CHIN. | Miu-yen-tau.

Euphorbia lunulata. Tsch-tsib., | CHIN.
This is called cat's-eye euphorbium. Its young shoots are edible; used also like E. chamesyce.—Smith.

EUPHORBIA NIVULIA. Buch, W. Ic.

E. mellefolia, Linn., Roeb., Rheede.

Euphorbia nivulia. A plant sacred to Muns or Manusa, the goddess of serpents. The root, mixed with black pepper, is employed for the cure of snake-bites, both internally and externally.—Roxb. ii, 465; O'Sh.

EUPHORBIA NIVULIA. Buch, W. Ic.

E. mellefolia, Linn., Roeb., Rheede.

Pattan, Pat, Sj., Eng. | Elle kalli,|

Euphorbia nivulia. Branches round; juice used by the natives as a
purgative; externally, mixed with nimmer oil, as a stimulant in rheumatism and contracted limbs; leaves diuretic. Grows all over the rocky parts of the Dehkan. Abundant over all the hills within some miles of Ajmir. It has a whitish, dead appearance, except during the rains, and forms a capital fence round fields. etc.—I. E. Stewart, M.D.

EUPHORIA ROYLEANA. Bois. Shakarpitan, Hind. Grows wild in the Siwalick tract; is used as a hedge plant, growing on a dry rock. By boiling down the juice of this euphorbia, adding dates, and again boiling and skimming, a gutta-percha-like material was obtained, better fitted for cementing iron than that from the Ficus indicus or F. religiosa, etc.—J. E. Stuart, M.D.

This little annual plant is common in the south of Asia. Its juice and flowers are purgative, and given in worms. — Rozz. O'Sh. Honig.

Natives of India suspend in their houses a few branches of the milk-hedge to attract flies. On the Bombay side it is used as a dammage material for the flat roofs of houses. The root of old shrubs is adapted for gun-stocks, but plants of sufficient age are seldom met with. On the Godavery it grows to a tree, and the wood seems hard, but is not used there. The plant is much used for hedges. It grows best either upon a bank, or wall of large stones laid loosely for the purpose, having a good cover of earth upon it. Any cuttings will grow, and the plant, if by itself, will attain the height of 20 feet or more. The wood makes the best charcoal for gunpowder. A parasite of it is to be seen in large white, and leafless (the Cassity filiformis), is very destructive to it, and will totally destroy a tree or a whole hedge in a short time, if not removed. The milk, mixed with flour, in doses of a drachm daily, is used to bolster, an Indian specific in syphilis. The inspissated milk is a violent emetic and purgative.—Rozz. O'Sh. Wight. RiddeI.

A concrete gum-resin, obtained from Euphorbia Canariensis of N. Africa and the Canaries, E. officinarum of Arabia and Africa, E. antiquorum of Arabia and India, and E. tetragona. That found in the Indian bazaars is from E. antiquorum and other species. King Juba of Mauritania is said to have called it after his physician, Euphorbus.

EUPHORIA LONGANA. Rozb, Lam.

Seytale longana, Rozl. Nephelium longanum, Comb.

A rather large, handsome tree, common in Ceylon in all the jungles, up to 3000 feet, on the west side of the Madras Presidency, in South Canara, the Animallays, Timneckley mountains, the Sivagerry Hills, Courtallum, in Mysore, Bombay, Eastern Bengal, and China. The wood is said to be hard, close-grained, and white, and worth attention. The succulent aril of the seed is an agreeable acid, and something like the Litchi. As a genus it should not, Col. Beddome thinks, be kept distinct from Nephelium.—Bedd. Pl. Syu.

EUPHORIASIA OFFICINALIS, euphrasy, eye-bright, a native of the heaths and pastures of Europe, of the Himalaya, Kashmir, and all the north of Asia. It is a pretty plant, slightly bitter and aromatic; once celebrated as an application to weak eyes, but now seldom or never employed.—O'Sh. Hogg. Honig.

EUPHRATES, in Arabic and Persian Forat or Forath, in the Hebrew language Pethah or Phrath, words which mean to frustrate or to fertilize. The elevated plateau which extends from the base of Mount Ararat into Northern Armenia, Kurdistan, and part of Asia Minor, contains the sources of four noble rivers, having their estuaries in three different seas. One of these, the Euphrates, rising near the shores of the Black Sea, and in its course to the Persian Gulf almost skirting those of the Mediterranean, at one time formed the principal link connecting Europe commercially with the East. It has two great sources in the Armenian mountains, and the most northern of these sources is situated in the Anti-Taurus, 25 miles N.E. of Erzerum. The branch from thence takes at first a westerly direction, and, after passing through 8 miles of the capital of Armenia, is joined by two small feeders. Its first large tributary, however, is the Mahmah Khatum, which runs into it down the plain of Tejran. From hence the river, which is now a considerable stream, known by the name of the Kara Su, makes a circuit, winding through the mountains and over rapids, into the plain of Erzinger, through which it flows in the same general direction, close to the town of that name. At Erzinger it is fordable only at a few places even in the dry season. As it nears the ancient Hit, with its bituminous fountains, the stream has an average width of 350 yards with a depth of 16 feet, and a current of three knots per hour in the season of the floods, when there are fourteen islands, on some of which are small towns. About 70 miles lower down is the modern castle of Fulujia, situated 220 miles W. 2° N. of Beyhadh. The average width in this part of the river decreases a little, being only about 250 yards, with an ordinary depth of 20 feet; and there is a current of less than 24 miles per hour in the flood season, when the river forms thirteen islands without wood. About Fulujia, at 54 miles N. 60° W. from it, the deviation, or channel, called the Saklawyeh, takes place; this stream crosses Mesopotamia by a tortuous eastern course on the north side of Akar Kuf, and enters the Tigris at a point 5 miles below Baghdad, but, until altered by Daud Pasha to avoid the danger of inundations, it joined the Tigris a little above the city. The distance from river to river (by the course of the Euphrates steamer, in passing, under Lieut. Lynch, in 1838) is about 45 miles. Near the junction of the Euphrates and Tigris in lat. 31° N. and long. 47° E., after a course of 390 miles,
EUPHRAITES.

is the walled town of Kurnah, containing about 800 houses, disposed along the right bank of the Tigris and the left of that of the Euphrates. The Euphrates and Tigris from this form one tidal channel, almost half a mile wide, and which takes nearly a straight course S. 37° E., under the well-known appellation of Shat-el-Arab, and when 5 miles beyond Kurnah, their united waters receive those of the Kerah or Kerkhah, which, coming from the mountains of Ardelan through an extensive tract of country, passes a short distance westward of the ruins of Susa, and likewise of the town of Hawizah. After receiving this accession, the Shat-el-Arab flows through date groves and near several villages, chiefly on the left bank, and at length arrives opposite Basrah, which is 39½ miles by the river, and 36 miles S. 34° E. direct from Kurnah. Basrah is built on both sides of a creek or canal, and contains about 6000 houses, which commence nearly at the edge of the main stream, and on its right bank. Below the city, this majestic river sweeps a little more to the eastward; its width is about 700 yards, its ordinary depth 30 feet, and it forms three large islands between this place and the small town of Mohamarah, that is, within a distance of 22½ miles by water, or 24½ miles direct S. 70° E. Here the Karun enters it, after a long course from the Koh-i-zard, through Shushtar, Ahwaz, and other places. After this great accession to its waters, the Shat-el-Arab inclines a little more towards the south. During the remainder of its course it passes many large villages, and almost continuous belts of date groves, and at length it reaches the sea, which at the bar is 40 miles from Mohamarah. Between this last place and the sea its average width is 1200 yards, and its ordinary depth 30 feet.

The permanent flooding of the Euphrates is caused by the melting of the snow in the mountains along the upper part of its course. This takes place about the beginning of March, and it increases gradually up to the time of barley harvest, or about the last days in May, when it is usually at its greatest height. The river continues high, and its course very rapid, for 30 or 40 days; but afterwards there is a daily decrease, which becomes very rapid towards the autumn. From the middle of September to the middle of October the river is at the lowest. Lieut. Rennie found the quantity of water discharged by the Euphrates at Hit to be 72,804 cubic feet per second; and the quantity discharged by the Tigris at Baghdad to be 164,103 cubic feet.

The Euphrates and Tigris valleys are considerable strips of good land, hemmed in closely by a barren desert. They have long ceased to lie on the track of commerce. They contain no place of importance, with the exception of the pilgrim shrines of Kerbela and Meshed All, and the decayed city of Baghdad, and a few villages, depending for their subsistence on the date palm, the disforesting of the hills in the upper part of their course having rendered both the Tigris and the Euphrates subject to sudden freshets, which overflow the bank and wreck the labours of the husbandman. For 150 miles the latter river passes through a barren desert, succeeded by unprofitable marshes, while the Tigris from Mosul to Baghdad boasts but three inconsiderable villages, and from Baghdad to Busora about six. Iraq, the ancient Babylonia, is now either a swamp, or an unproductive desert covered with reh, the result of over-irrigation in ancient days. Owing to rapid alternations of flood and drought, this vast plain, once so fertile, is neither habitable nor cultivable at the present day. The great irrigation works constructed by captives have fallen into ruin, and the miserable Arab population that now does the work of Iraq, is useless for any kind of sustained labour. So late as the 12th century, Upper Mesopotamia contained several flourishing towns, dependent, however, for their existence on the traffic between Eastern Asia and Europe. As trade declined, these different stations gradually disappeared, and, under the terrible effects of Mongol and Othoman conquests, Western Asia was rapidly depopulated, and reduced to its present condition. South-Western Persia is at present destitute even of nomadic and pastoral tribes, with the single exception of a tract of cultivated land lying between Dizful and Shushtar, and another between Dilam and Bushire. Nevertheless the region will ever be of interest. The valley of the Euphrates and Tigris is the home of man's earliest traditions; and Babylon was on the Euphrates, Nineveh on the Tigris. The Euphrates was crossed by Abraham. The crossing of the Tigris, the passage of which is noticed as Heber (Ether), occurred p. 165, in 5000, subsequent to Nimrud. The mountainous lands at the sources of this river formed the primeval seat of the Semitic races (Bun. iii. pp. 413-460). The western side of the Euphrates, and stretching towards Feliuja, is a tract pregnant with interest; for between the last-named place and the bitumen springs of Hit, the battle of Cunaxa was fought, in which the younger Cyrus lost his life, and whence Xenophon made a retreat more brilliant than victory.—Mignan's Travels, pp. 254, 326; Porter's Travels, ii. p. 252; Skinner's Journey, ii. p. 185.

EUPLEIA MIDAMUS, a very beautiful butterfly of the Malay Archipelago. It is exactly mimicked by two rare papilios (P. paradoxus and P. xenigma). The even more beautiful E. rhadamantia, with its pure white bands and spots on a ground of glossy blue and black, is reproduced in the Papilio camaus.

EUPLECTELLA ASPERGLIUM, a superb sponge found in Japan, the Moluccas, and Philippine Islands. The strangest, as well as the most beautiful, inhabitants of the deep-sea ooze are the glassy sponges, in which the skeleton is composed not of horny fibres, as in the sponges of our dressing-rooms, but of flexible flint, often more delicate than the finest spun glass. The best known of these is this Venus's flower-basket, or Euplectella, which lives embedded in the mud of the seas of the Philippines, supported by a glass frill standing up round it like a Queen Elizabeth's ruff. In Europe it may be now bought into curiosity shop, and is one of the most exquisite, both in form and texture, of all natural objects; it is often seen as a drawing-room ornament.

EUPODOTIS EDWARDSII. Gray.

This noble bird is 4½ to 5 feet long, and extent
EURYALE FERROX. Salis.  
Nymphasatellata, Wildde. | Annenea spinosa, Roxb.  
Machana, Machana, Hind. | Nallani padman, tel.  
A water-lily with a small bluish purple flower, covered everywhere with prickles, and so closely allied to Victoria regia as to be scarcely generically distinguishable from it. It grows in all S.E. Asia and in Japan. The discoverer of Victoria called the latter Euryale Amazonica, and these interesting plants grew side by side in the new Victoria house at Kew; but the Chinese species has been erroneously considered different from the Indian one. In China the plant is said to have been in cultivation for upwards of 3000 years. It is much cultivated there for its stems, rhizomes, and seeds, all of which contain much starch, and are eaten by the Chinese, who also prepare a kind of dry biscuit, called kien-shih-kau, from the meal of the kernels. These biscuits are sold by confectioners, and given to children suffering from the kau disease. The fruit is large, of the size of a small orange, pear-shaped, and indescent; its interior is white, hard, and starchy, and contains from 8 to 15 round black seeds as large as peas, which are full of flour, and are eaten roasted in India. This plant is common in the lake of Kashmir. Its broad round leaf lies on the water like that of the lotus, its under surface being covered with numerous hard, sharp, and hooked spicules. — Mrs. Hervey, Tartary; Royle, Him. Bot. p. 65; Hooker, ii. 255; Thu; Voigt; Smith.  
EURYANGIUM SUMBUL. Kaufman. A plant of Central Asia; yields the true sambul or musk root.

EURYCLIS AMBOINENSIS. Salis.  
Copa sylvestris, Rumph. | Pancratium Ambienense, L.  
Crinum nervosum, L. Her. | Prophyis Ambienensis,  
La-men; Nemen, . . . | Burn. 
This plant, one of the commonest of the Eastern lilies, is peculiar to Madagascar, and from its generic name has been called Bunga Si-kudup. By the Dyaks of the southern branch of the Sarawak river, amongst whom it is held in great esteem, by the Si-boysah sea Dyaks it is called Si-kenyang. By the Dyaks of the southern river the bulbous roots of this plant are preserved with jealous care, being always taken up when the rice is ripe, and preserved amongst it in the

EUSUFZAI.

granaries, to be planted again with the seed—rice in the following season. It bears a beautiful crown of white and fragrant flowers, which rise about a foot above the bulb.—Louv's Narasimuck, pp. 273-304: Mason.

EUSUFZAI, an Afghan tribe whose territory is bounded on the E. by the Indus, N. and E. by the Swat mountains, and W. by the Kâbul river and the Mehrâ or desert plateau between it and Hushanggur. The tract is intersected on the E. by oaks from the Swat mountains, but in other parts it is a perfect plain. The inhabitants are proud, warlike, and extremely sensitive in all matters connected with family custom. In the Peshawar district the Eusufzai are of political importance. As soldiers, they are not inferior to any of the independent tribes. They are the most martial of all the British subjects on that frontier, and the history of many generations attests their military exploits. Partieipators in every war that has convulsed the Peshawar valley, and always the rauous subjects of the Sikhs, they have now literally turned their swords into ploughshares, and are right good subjects of the British. Their customs have been respected, the allowances of the chief and their village headmen have been confirmed. Though constantly tempted with the Swat government to rebel, they only gave yield to temptation. At the battle of Tere, which gave the sovereignty to Peshawar to the Sikh, the Eusufzai formed the strength of the Mahomedan army, which, numbering 30,000 men, withstood a Sikh force of equal numbers, supported by guns and headed by Ranjit Singh himself. The Eusufzai are democratic and in small communities, with patriarchal government. They are agricultural, lying in warm and fertile valleys, touching the Indus on one side and the Punjorka on the other, extending on the south to Kâbul, occupying the northern part of the plain of Peshawar, Bunir, Swat, Punjorka, and Chumla. The Swat, Bunir, Punjorka, and the Eusufzai part of the Kâbul valley, are the lands of the Akkozai, the Mulzezi, and the Lawezai. The clans of the Eusufzai and Mahmudzai have a system of periodic interchange of lands, called Waish. The usual government of the Eusufzai are the Brahman at from 700,000 to 900,000 souls, and are of Afghan, Indian, and Kashmir blood, with the old occupants of the land, the Dehkanie and Swati. Many Eusufzai have fair complexions, grey eyes, and red beards; are stout and brave, quarrelsome and proud, and those in the plains are very immoral.

The Eusufzai were expelled from Garra and Nushky about the end of the 13th or beginning of the 14th century of the Christian era, and soon after settled in the neighbourhood of Kâbul. Ulugh Beg, whose power was at that time strengthened by the accession of many Moghuls, to rid himself of his troublesome allies, began by fomenting dissensions between the Eusufzai and Gugggeeani (for the Khukki has been broken into independent clans), and he soon after attacked them at the head of that tribe and his own army. He was defeated at first, but, having cut off all the chieftains of the tribe at a banquet, during an insidious peace which he had the art to conclude with them, he plundered the Eusufzai of all their possessions, and drove them out of Kâbul. The Eusufzai, reduced to extreme distress, took the way to the neighbourhood of Peshawar. That country was then in a very different state from that in which it is at present. The tribes who now possess it were then in Khorasan; and the plain of Peshawar, with several of the neighbouring countries, was occupied by tribes which have since either entirely disappeared, or have changed their seats. Lachmann was in the hands of the Turko-Pathan, who are now in Bâgour; the tribes of Khaibar and the Bungush had already occupied the present lands, but all the lower part of the valley of Kâbul, the plain of Peshawar, with part of Bajour, Chuch, Hazareine, and the countries east of them as far as the Hydaspes, belonged to the Afghan tribe of Dilkazak, which is now almost extinct. The country between the Dilazak and the range of the Hindu Kush, on both sides of the Indus, formed the kingdom of Swat, which was inhabited by a distinct nation, and ruled by sultan Oveiss, whose ancestors had long reigned over that country. On the first arrival of the Eusufzai, they threw themselves on the generosity of the Dilazak, who assigned them the Doabeh for their residence.

Living among a conquered people, like Spartans among Helots, and enjoying entire independence on all around, every Eusufzai is filled with the idea of his own dignity and importance. Their pride appears in the gravity of their manners, and in the high terms in which they speak of themselves and their tribe, not allowing even the Daurani to be their equals.—Elph. Caboul; Rec. Gort. Ind., No. ii. Parl. Pap. E. I., Cabool and Afg. Suyh.

EUTHYDEMUS has been noticed at p. 222, Bactria. He led the Syrian army through Bactria, i.e. by the route N. of the mountains, to the Kâbul valley and across the Indus, in B.C. 206. There Antiochus made peace with Sophagassenus (Asoka), which that sovereign recorded by edicts on rocks and pillars in various parts of India, in characters exactly resembling those on the coins of Agathocles. In B.C. 205, Antiochus returned by way of Arachotia. The translation of the edicts of Asoka is in the Asiatic Society’s Journal for 1838, and that on the Ginnar rock names Antiochia as Antioch and Asoka as Asoka. son of Euthydemus, obtained possession of Arachotia, and a large portion of Persia; he also made conquests in India, and was in possession not only of Lower Sird, but also of the coast of India, further to the east. He seems, however, to have been excluded from Bactria, of which Eucratides remained master. After the death of Euthydemus, Demetrius made an unsuccessful attempt to dispossess his rival, and in the end lost all his Indian conquests, which were seized by Eucratides.

—Elph. p. 245.

EYAPORATION.

M. Lamanieres mentions that the engineers in the Madras Presidency allow for a large rate of water in irrigation by evaporation, of 3 inches daily per square yard of land irrigated. In the Red Hill tank, near Madras, in the five months April to August the water went down 75 inches, in spite of 8 inches of rain, in all 83 inches. Of that, 53 inches were lost by evaporation, and 30 inches used in irrigation. In the years 1864-65, in the same months, at Pondicherry, the mean daily evaporation was 0.329 inch; at Red Hill tank, Madras, in the tank, 0.374, and in the open, 0.469. The depth of the waters, the prevalence of dry winds, and the degree of tree shelter for the waters, exercise great influence over the rates of evaporation. It
EVE.

The evil eye alluded to in Proverbs xxviii. 22 and Mark vii. 22, is still a subject of dread in all Eastern countries, as well as in many of those of Europe. The Irish and Scotch as much believe that their cattle are subject to an injury from the blight of the evil eye, as did Virgil's shepherd when he exclaims, Nescio quis teneor occlusus miliati fascinae agnos. The Greeks of the present day entertain the same horror of their Kako mazi as did their ancestors in their Baskanos ophthalmos, and the Mal occhio of modern Italy is the traditional fascinatio of the Romans. Mr. Buckingham relates that, when in Persia, being ill, his companions attributed his sickness to the ill-wishes of a malignant enemy; to remove which, a fakir took some rags from his body and deposited them in the new-made graves of some holy personages, believing that they thus acquired a virtue potent enough to dispel the supposed evil influence. The Arabians and Turks believe in it, and apologise for the profusion of jewels with which they decorate their children, on the plea that they are intended to draw aside the evil eye. The Mahomedans suspend objects from the ceilings of their apartments for the same purpose; and the Singhalese and Hindus place whitened chatties on the gable ends of their houses and in fields, to divert the mysterious influence from their dwellings and crops. The Mahomedans hang round their children's necks, and suspend in their houses, or place over the lintels of their doors, charms consisting of verses of the Koran, which are inscribed by holy men, or incantations by pretended exorcists, written on paper, or engraved on potstone, silver or gold, to guard against the evil eye. And Hindus resort to their temples to make offerings to their deities for the same object. Hindus and Mahomedans alike think that jewels on children tend to attract on the jewels the evil eye. Hindu mothers, when they suspect that the evil eye has fallen on their child from home, on returning to their house, take some chillies and salt in their hands, and describe a circle round the infant's head, and thereafter place the chillies and salt in a well or in the fire, to destroy the evil eye and its charm together. Pretending exorcists, both men and women, also exorcise those blighted with the evil eye, by reciting a charm over cow-dung ashes, and rubbing it on the forehead and body of the child. In Italy, Pope Pius ix. is supposed to have had the evil eye. Popular superstition has generally divided them into two classes,— those who involuntarily and innocently possess the fatal power, and are unconscious of its exercise, and those who knowingly acquire it, and take a delight in exercising it against all who offend them. The maleficent power has been known by several English words. It is to 'eye-bite,' to 'overlook,' and to 'take.' The French and Italians simply call it fascination in the evil sense of the word; the Germans, the Scheelenauge, or squint-eye, ascribing the power to a squid; and the Zauberklick, or enchanted glance. To 'take,' in Shakespeare, means to blast or blight by witchcraft. In King Lear, act ii, scene i, occurs the imperative, Strike her young bone, you taking airs, with lameness.' He says of Herne the Hunter, in The Merry Wives of Windsor, that he 'blasts the tree and takes the cattle, and makes milch kine yield blood.' In Hamlet, speaking of Christmas time, he says,—

EYE.

'The nights are wholesome, then no planets strike, No fairy takes, no witch hath power to harm, So hallowed and so gracious is the time.'

And this meaning, somewhat modified, still holds good amongst English women.

Pliny speaks of 'those among the Triballians and Illyrians who with their very eyesight can kill those whom they look wistfully upon for any long time,' and Plutarch states, on the authority of Philaretus, that 'the Thibyens who inhabited Pontus were deadly not only to babes but to men grown, and whomsoever their eye, speech, or breath would reach, were sure to fall sick and pine away.'—Buckingham's Travels, p. 172; Miller's Seven Churches, p. 120; Burton's City of the Saints, p. 129; Somnerat's Voyage, p. 89; Sir J. E. Tennant's Ceylon. See Somal.

EXEVULUS ALSINOIDES. Linn., Roxb.

Sankh pushpi, . . . HIND. | Vishnu kranta, . . . TEL. | Vishnu kariand, . . . TAM.

This, the F. hersutus, Lam., is common in many parts of India. The different parts of this plant are used in medicine.—J. L. Stewart, M.D.

EXACUM BICOLOR, Roxb., has long been used as a bitter tonic. It grows in Cuttack, at Mangalore; rare on the Neilgherries below Kottagerry, and abundant a mile below Neduwuttam, where it flowers during the autumn months, and enamors the Ghat Ghats with its beautiful blossoms. It has the same bitter stomachic principles for which the Gentiana lutea is so much employed. It is sold in Mangalore at 1 anna 6 pice per pound, and is used as a substitute for Andrographis paniculata.

EXACUM TETRAGONUM. Roxb. Purple cherryta.

Koochuri, . . . BEN. | Ooda cherryta, . . . HIND.

A very elegant plant growing throughout British India. Its large flowers are beautifully blue, with gold-coloured anthers. Other species are E. carinatum, pedunculatum, and teres.— Roxb. i. p. 398.

EXEOCARIA AGALOCHA. Linn.

Arbor excoecans, Rumph, Amb. ii. 179. 

Ugaru, . . . BEN. | Gengwa, . . . HIND. 

Ya tau, Ka yau, BURN. 

Bute bay-a-zu, . . . Tella keeriya gass, Singh. 

Bute baya-za, . . . Tella chettu, . . . TEL.

This small tree grows in Ceylon, where it is very common in salt swamps near the sea. It grows freely in the Sunderbuns, is plentiful in the Rangoon and Tounghoo districts, and grows through the Eastern Archipelago. The Bengal name, Ugaru, indicates a belief that it yields the fragrant aloeswood of commerce, but this does not seem to be the case. Dr. O'Shaughnessy at one place says (p. 668) that its wood is knotty, grey or blackish, smooth and resinous. But Dr. M'Clelland describes it as white-coloured, and adapted to every purpose of house-building. The sap is described as extremely acrid, and as causing great agony, if, in cutting down the tree, any of it fall into the eyes. Hence Rumphius' name, Exoecans, or blinding; and this is probably correct, as Rumphius himself became from some cause blind at the early age of 44.—Thee; M'Cle; O'Sh.

EXEOCARIA JAMETTA. Spreng.

Tiger's milk tree, . . . ESC. | Kametti, . . . MALAE. 

Grows on the western coast of India. It abounds in an acrid juice, from which a good kind of caoutchouc may be prepared.—Druy.

EXEOCARIA OPPOSITIFOLIA. Jack. This is E. cremulata, Wight. It is a small tree growing in Malabar, on the Anamallay Hills, and common in the central province of Ceylon at an elevation of 4000 to 6000 feet.—Thur.; Jack, Cal. J. Nat. Hist. iv.

EXEOCARIA SEBIFERA, J. M., syn. of Sapium sebiferum. This is the Chinese tallow tree. The white pulp round the seeds give the Chinese tallow, which is separated by boiling in water, and used in China and Japan for candles; it melts at 104°. The seeds yield an oil, and the leaves a black dye. Wood hard, used for printing blocks.

Other species included are E. acerifolia, bacata, Cochin-chinemis, holophylla, and virgata. The acrid juice or milk of E. insignis, E. Indica, and E. agallocha is poisonous, and the seeds of E. Indica are used to poison fish.

E. insignis is a tree of Kangra, and E. Indica a tree of the Sunderbuns.—Rozb.; Gamble; Kurz; EXIDIA AURICULA JUDE. Fries. Jew's ear fungus, one of the thallogens, of most universal growth, and used medially. E. hispida is one of the edible fungi of China.

EXOCARPUS, an inferior kind of sandalwood, the produce of Exocarpus latifolia, is met with in the Percy Isles, Repulse Bay, Cape Upstart, Palm Islands, etc.

EXOCEUTUS, a genus of fishes belonging to the abdominal Malacopterygii, forming part of the family Exocidæ. Their pectoral fins are very long, nearly equal to the length of the body. The fish, to escape its enemies, rises into the air, and its pectoral fins vibrate while wet, and re-vibrate as often as they pass through a crest wave, wetting the fins afresh. Some of the fish proceed from 70 to 250 yards. There are several species of the flying fish: Exocetus volitans, Linn.; E. stenopterus; E. evolans; E. exilienis; E. mesogaster. The E. stenopterus has usually 10 or 12 inches long, but attains to 15 or 20 inches. Thirty-two or more seconds is the greatest length of time that their flight has been observed, and distance accomplished 250 yards. They are captured by torchlight in the West Indies.—Collingwood; Bennett's Gatherings of a Naturalist; Bikmore.

EXOGAMY, the custom of selecting a wife from a different tribe. Exogamy prevails throughout Western and Eastern Africa, in Circassia, Hindustan, Tartary, Siberia, China, and Australia, as well as in North and South America.—Lubbock, Orig. of Civil. p. 99.

EXORCISM is practised very frequently, more especially by the Shanar race of S. India. See Charns; Divination; Evil Eye; Ordeal.

EYES PAINTING, mentioned in 2 Kings ix. 30, Jeremiah ix. 30, Ezekiel xxiii. 40, and tiring of the head are still common in every Eastern country. In painting the eyes, Mahomedans use two substances, lamp-black (kohl) and grey oxide of antimony; the latter the men use, and the women use lamp-black. But thoughout India plumbea is substituted for antimony.

EYRE. General Sir Vincent Eyre, C.B., K.C.S.I., born 22d January 1811; died 1881, at Aix les Bains, Savoy. He served in the Bengal Artillery, 1828. He was at Kabul in the Afghan insurrection in 1841, when he commanded a
EYUB.

This is a page from a book about various topics including history, agriculture, and flora. The page contains text about the history of Babylon, the beginning of the war between the Assyrians and Egyptians, and the capture of the city. It also mentions the use of certain plants and their properties. The text is dense and technical, with references to biblical figures such as Ezra and Ezekiel. The page ends with a discussion on the cultivation of trees and their uses in various cultures.
was introduced into Europe by the crusaders; and in many parts of France, where it is commonly grown, is called Saracen corn. So much is it esteemed in Belgium, that M. Bory St. Vincent says he was shown the tomb of the person who is reported to have first brought it into that country.

**FAGREA**, a genus of plants of the natural order Loganiaceae, *Lindl.* F. lanceolata, *Bl.*, is a tree of Penang and Java; *F. Malayana, Mart.*, is a tree of Penang. Dr. Wright in his Icones figures the three species, Coronandelliana, Malabarica, and Zeylanica.

**FAGREA COROMANDELIANA.** *V. l. c.* A small tree, with very large showy flowers, common throughout the western forests of the Madras Presidency, from the level of the sea to nearly 6000 feet. It is well worth cultivating for ornament.

It may be *F. obovata, Wallich*, a tree of Khasaya and Singapore. Gamble notices six species.

—Beddome, *Fl. Sylc.* p. 244.

**FAGREA FRAGRANS.** *Roxb.* i. p. 460.

This evergreen tree grows in Martaban, inland up the Attaran river, is very abundant in Amherst, Tavoy, and Mergui, and in the islands of the Tenasserim coast. Its maximum girth 4 cubits, and maximum length 20-25 feet, but is of so slow growth that the Burmese refer to it in a proverb. When seasoned it sinks in water. It is a compact, yellow, and very beautiful wood, a very hard and excellent timber. It bears a breaking weight of 400 to 500 lbs., and its chief value as a timber is its imperishability when exposed to water or land. It takes stain well and not attack it. Neither heat nor moisture will warp or rot it. It is impervious to the attacks of ants; and the posts of a wharf at Tavoy, which for several years had daily, as the tides flowed and ebbed, been partly dry and partly wet, continued untouched by the worm. It is used for building houses, kyoungz, yats, etc., as posts for Buddhist edifices, piles for bridges, wharves, etc., but for lay purposes only by the British, as the Burmese regarded it as too good for the laity, and say it ought to be confined to sacred purposes. Hence, as the phonnycas or Burmese priests look on it as a sacred tree, it has been more preserved in the forests of Amherst, Tavoy, and Mergui, than any other valuable wood.

It is scattered thickly over the alluvial plains together with Stryclhnoz nux vomica. It has been recommended for railway sleepers.—Mason; Capt. Dance's Rep.; *M'Clelland's Report; Roxb.*

**FAHAM TEA.** A name given in the Mauritius to the dried leaves of the *Angraecum fragrans,* a fragrant orchid which owes its odour to the presence of coumarin. The infusion is drunk to promote digestion, and is useful for certain diseases of the lungs.—*Simmonds' Diet.*

**FA HIAN,** a Chinese Buddhist traveller in India, Khotan (Yu-than), and Tibet, along with Hocq King and other Chinese pilgrims. They reached Yu-than or Khotan in A.D. 399-400. Fa Hian then travelled by Tu-bao and Yu-ho and over the Tau-Ling mountains southwards to Kie-Chha, the modern Lalahk, where he rejoined Hocq King. From Kie-Chha the pilgrims proceeded westward to Tso-ly, which they reached in one month. He passed successively through Kashnir, Kabul, Kandahar, and the Panjab, into the central parts of India, and the country of

1069
Mathura was one of the first in which he entered (Cal. Rev.). He left China A.D. 399. He was six years on his route to Central India, residing at places on his way. He passed six years in India, visited Ceylon, and sailed from there to Java, and returned to China A.D. 415. The silence of Fa Hian and Hiuen Thsang regarding Dehli is a proof of the insignificance of that city from A.D. 400 to 640. His usual place of residence was Chang-an, in the province of Shen-si. On his return he wrote an account of his travels, called Fo-kue-kì, or an account of the Buddhist countries. His journal is very concise, and is chiefly taken up with the description of the sacred spots and objects of his religion; but as he usually gives the bearings and distances of the chief places in his route, his short notices are very valuable. At the time of his visit, Buddhism was still the dominant religion, though Vaishnava doctrines were gaining ground. T-Ising gives a history of fifty-six Chinese Buddhist priests who visited India during the early part of the T'ang dynasty.—Cal. Rev.; Travels of a Hindu, p. 109; Cunningham's Ancient Geography of India. 

FAILI, a tribe of Kurds, also called Bakhtiar, who dwell in the mountainous part of Kirman-shah. See Kurdistan.

FAILI, zamín, amongst the Rajputs, security for good behaviour. Hazir zamín, security for re-appearance.

FAIR, called in India a mela or assemblage, is held periodically at many places. The system exists in full force in Turkestán, north of Hindu Kush. It is not unknown in some parts of the Kâbul dominions, and has long been familiar to the natives of India. At the great Dehli fairs, 50,000 persons assemble, some of them from 500 miles' distance. In 1861, at the great solar eclipse, 200,000 persons assembled at Thaneswar in Ambala, some from 1000 miles away. About 150 fairs are held in the Panjab, and the Hindu custom of assembling at shrines, and taking the opportunity of displaying merchandise prevails throughout India. In Asia they flourish as the only means by which nations distant from each other, and the population of which is often widely spread, can be readily supplied with articles of home and foreign produce. The merchants who carry on the trade from India to Kâbul are principally the Povindah or Lohani Afghans, whose country lies westward of the Indus between Dehra Ismail Khan and Kâbul. They make annual journeys to and from these places, bringing with them the productions of Afghanistan, and taking back those of India and Europe. They are a race, and require no protection but their own arms. They leave the rugged mountains of the west at Drabund, and assemble at Dehra Ismail Khan, where they dispose of some of their property; others proceed lower down the Indus to Dehra Ghazi Khan, or cross to Multan and Bahawalpur, where their wants in a return supply of goods are sometimes to be procured. Failing this, they pass into the India, and even to Calcutta and Bombay. The Lohani and other traders descend from Bokhara and Kâbul about the month of November, and set out on their return in the end of April. In the Russian empire, fairs have been founded in the memory of man, at which business to the amount of 200,000,000 of roubles, or about £10,000,000 sterling, is now transacted, and this is even on the increase. The removal of the great fair of Maccare to Nijni has only served to give commerce a greater impetus.—Burns, in East India Priests, School and Afghanistan, p. 103.

FAIRY HAIR. Exg. Adiantum capillus Veneris. The Persians give the name of Mu-Fari, or Hair of the Fairy, to Saxifraga stenophylla. 

FAIZABAD, the capital of Badakhshan. The people are purer Iranians than the Tajik.

FAIZABAD, a town in Oudh, situated in lat. 26° 46' 45" N., and long. 82° 11' 40" E., on the left bank of the river Gogra, 78 miles east of Lucknow; adjoining it to the west is the modern town of Ajodhya, both towns being on the site of the ancient city of Ajodhya. It gives its name to a revenue division or commissionership of Oudh, with a population (1869) of 2,648,070 Hindus; Mahomedans, 315,604; Christians, 1410. The district consists of a densely populous, well cultivated plain of great fertility, having an average elevation of 330 feet above sea-level. The principal river, and that which affords the chief means of communication between Faizabad and the Gangetic Plain, is the river Sarul, and the early history of Faizabad is that of Ajodhya, of which kingdom it formed a part. Faizabad, two miles and a half in length by one mile in breadth, is built chiefly of materials extracted from the ruins of Ajodhya. The two cities together occupy an area of nearly six square miles, just about one-half of the probable size of the ancient capital of Rama. In Faizabad the only building of any consequence is the stuccoed brick tomb of the old Bhaq Begum, whose story was dragged before the public during the famous trial of Warren Hastings. Faizabad was the capital of the first Nawabs of Oudh, but it was deserted by Asaf-ud-Dowlah in A.D. 1775.—Tod's Rajasthan; William Na. 

FAIZI, the literary title of Shaikh Abul Faiz, son of Shaikh Maharak, and elder brother of Abul Faiz, who lived in the reign of Akbar, emperor of Hindustan. Faizi was presented to Akbar in the 12th year of his reign, and introduced Abul Faiz six years later, in A.D. 1574. The brothers soon became the intimate friends and inseparable companions of their sovereign. They not only were the confidants of all his new opinions in religion, and his advisers in his patronage of literature, both in foreign countries and in his own, but were consulted and employed in the most important affairs of government. Faizi was sent on a special embassy to the kings of the Dekhan, prior to Akbar's invasion of that region, and Abul Faiz lived to attain the highest military rank, and to hold the office of prime minister. At midnight, when the news was brought to Akbar that Faizi was dying, he hastened to his room, and called out to him, with a familiar term of endearment, 'Shaikh-Ji, I have brought All the physician to you; why do you not speak?’ pressing no further, he threw his arm round the dying man, and kissed the strongest expressions of sorrow. On recovering his composure, he went to Abul Faiz, who had withdrawn from the scene of death, and remained for some time endeavouring to console him, before he returned to his palace. Faizy was the first Mahomedan who applied himself to a diligent study of Hindu literature and science. By the aid, and under the direction of the emperor, he conducted a systematic inquiry into every branch of the
knowledge of the Brahmins. He translated from the Sanskrit the Nala and Damayantu, an episode of the Mahabharata; he made a version of the Bijja Gana and Lilawati of Bhaskara Acharya, the best Hindu books on algebra and arithmetic. He wrote a great deal of original poetry and of other works in Persian, and he superintended translations made by other learned men, including one at least of the Vedas, the two great historical and heroic poems the Mahabharata and Ramayana, and the history of Kashmir, the only specimen of that sort of composition in Sanskrit prose. He was directed to translate the Evangelists. He seems to have been more studious and less a man of the world than Abul Fazl. When Abul Fazl was assassinated, Akbar was deeply affected, and passed two days and two nights without food or sleep.—Elliot: Elph. p. 468; Sandatkh k Tawarikh.

FALKHAT, a grey colour, probably from Falkhät, HIND., a dove.

FALCONER, HUGH, a Bengal medical officer, a distinguished palaeontologist. He was born at Forbes in 1808, and went to India in 1829. He was one of the first botanists who visited Kashmir and Little Tibet, Kamaon, and the Punjab, where he formed magnificent collections, illustrating his specimens with voluminous notes and details of their structure and affinities. He was superintendant of the Botanic Gardens of Saharanpur and Calcutta. He returned to England in 1856 or 1857, and died 31st January 1865. In the latter half of his life, he devoted his time to the study of mammalian palaeontology; and, after his death, two volumes of his palaeontological memoirs and notes were published by Dr. Murchison. He and Sir T. P. Cautley examined the fossils of the Siwalik Hills; Fauna Antiqua Sivanesia, or the Fossil Fauna of the Siwalik Hills, Cautley and Falconer, Lond. 1845-1846, folio. He wrote an Account of Fossil Bones at Hurdwar, in Bl. As. Trans. 1837, vi. 233; On Elastic Sandstone, ibid. 240; On the Geology of Perim Island, Gulf of Cambay, in Lond. Geol. Trans. 1845, i. 365. Of the many varied subjects treated of in the palaeontological memoirs, there are several of great interest even to the general reader. His investigations have shown that, at a period geologically recent, the present Peninsula of India was a triangular island, bounded on each side by the Eastern and Western Ghats, converging to Cape Comorin, while the base of the triangle was formed by the Vindhya mountain range, from which an irregular spur (forming the Aravalli mountains) extended northwards; while between the northern shore of this island and a hilly country, which ran along the Himalaya mountains, ran a narrow ocean strait. The coast of this strait became covered with débris from the adjacent Himalaya on its northern shore, and with this débris became entombed and preserved many and various animal remains. The present condition of the country has been produced by an upheaval of the land, so that what was the ocean strait forms now the plains of India,—the long, nearly level valleys in which flows the Ganges and the Indus. Besides this, a great upheaval along the line of the Himalaya has elevated a narrow belt of the plains into the Siwalik Hills (determined to be but of tertiary age), and added many thousand feet to the height of the Himalaya. In the Siwalik explorations, Dr. Falconer and Sir T. P. Cautley discovered the sivatherium, a gigantic four-horned ruminant-like animal, considered by Dr. Falconer to have been furnished with a trunk like the tapir; also certain fossil apes, the first ever discovered, and a gigantic tortoise, Colossocyclus atlas, a description of which was communicated to the Zoological Society in the year 1844.

FALCONERIA INSIGNIS. Royle.
Exocerca insignis, Mull.
This tree only extends scantily along the Panjāb Siwalik tract as far as the Beas. The wood is occasionally employed for domestic purposes, but is of no special use. F. Mahabara, Wight, is a synonym of F. insignis.—Royle, Ill.; Stewart.

FALCONEIRA WALLIICHIANA, Royle, a tree of Nepal.
FALCONIDÉ, a family of birds of the order Raptora, comprising the sub-families Accipitriné, Aquilina, Buteoninae, Falconinae, and Milvine. With five or six exceptions only, the whole of the European diurnal birds of prey are met with in India, many of them being much commoner in that country, and they are associated with numerous other species unknown in Europe. The true Falco peregrinus is common in India, together with F. peregrinus, which would otherwise be regarded its Indian counterpart. The shangar of Indian falconry seems to denote it as a bird of excessively rare occurrence in the Panjāb. The Falconinae are the True Falcons, and those of the south and east of Asia are as under:—

1. Peregrines, viz.
   Falco peregrinus, Gmel., peregrine falcon, Bhaire.
   F. peregrinus, Sundevall, the Shakhan or royal falcon.
2. Lanners, viz.
   Falco sacer, Schlegel., the Saker or cherrug falcon.
   F. jugger, Gray, the Laggar falcon.
   F. Balyolonicus, Gurney, red-headed lanner.
3. Hierofalco, ap. of Kaup, the Shankar or Shanger; is brought from northern countries.
   F. Falco.
   E. vespertinus, Linn., the red-legged falcon.
   Hierax erythrogenys, the white-naped pigma falcon.
   H. melanoleucus, Blyth, from Assam.

FALITA. HIND. A slow match; also, amongst Mahomedans, a lamp charm. Slow match is made generally, if for matchlocks, of the air-roots of the Bar tree; and if for cannon, of thread soaked in powder and spirits of wine.

FALLOPIA NERVOSA. Lour. The Kapiou-yeh and Hau-shan-ch'a of the Chinese, a tall shrub of Macao and Canton, furnishing a tea-leaf.

FALOMahomed, a kind of antelope.

FALODEH. PSITRO. A white jelly strained from wheat, and in spring-time, in Kabul, drunk with sherbet and snow.
FAMINES.

FAMINES.

FALSA.

FALSA. Hind. Grewia Asiatica; also its acid berry, used to make a sherbet.

FALSA. Hind. of Kota. Fibrous ginger, the inferior sort.

FALSE. Ar., Pers., Hind. A small copper coin, of varying weight and value, current in Arabia and Persia. Sometimes applied to the paisa of India. Also a copper coin formerly current in Madras, equal to five kas or cash.—W.

FAMINES.

Carestia. . . . Ir.

Famines have repeatedly occurred in S. Asia and in India, owing to the failure of rain, but occasionally aggravated by wars, necessitating an interruption to agricultural operations, and rendered longer distressing by succeeding swarms of insects and rats.

The Rev. Robert Everest seems to have been the first who adduced facts to show that unfavourable seasons in India are periodical. In the report on the Bengal famine of 1860-61, Colonel Baird Smith recommended irrigation, and remarked on the rough periodicity of famines, and it may be said that local famines recur in one part of the country or other every 5, 10, or 15 years, and greater famines occur in successive centuries, at intervals of 50, 100, and 150 years. Dr. W. W. Hunter, about the year 1877, mentioned that the years of famine in the Madras Presidency had been 1811, 1824, 1833, 1854, 1866, and 1877, there being deficient rainfall in preceding years. The years 1810 and 1825 were years of minimum sun spots; 1853 was the third, and 1865 and 1876 were the second, years preceding minimum sun spots. The average rainfall in Madras from 1813 to 1876 was 48-51 inches, and in all the famine years the rainfall was far below the average. And, from the occurrence of sun spots and of rainfall, between the years 1813 and 1876, he arrived at the conclusion that the minimum period in the cycle of sun spots has been a period of regularly recurring and strongly-marked drought in S. India.

In the past 109 years, 21 famines and scarcitys are recorded, making a proportion of two bad seasons to seven good. Of the greater famines there have been eight at intervals which have reached 12 years. Five have afflicted the 19th century, and have affected 202 millions of people. The practical result is that the Indian Government must be prepared for a drought followed by severe distress every twelve years, though an extreme famine may not ravage any one province oftener than once in fifty years. There seems some tendency for a bad year in the north to follow immediately a bad year in the south.

Great famines devastated the N.W. Provinces in 1770, 1783, 1803, 1819, 1887, 1861; and 1877. Droughts of less importance visited the same regions in 1738, 1744, 1752, 1790, 1818, 1826, 1883, and 1873. The less serious droughts occurred at intervals of 6 or 8 years; but at intervals ranging from 13 to 24 years the failures of rainfall have been sufficient to involve a bad famine. Each of the great famines was preluded by years of climatic irregularity, especially noticeable in the case of the famines of 1803, 1837, and 1861; the same phenomenon announced the advent of the dearth in 1877 in the N.W. Provinces.

Famines have been recurring in Asia from the most ancient times. That one mentioned as of the time of Abraham, was about B.C. 2247; that in Genesis xlii., which led to the sojourn of the Israelites in Egypt, was about 500 years later. 505-143 B.C.? In India, during the reign of the emperor Jyé-éland, there was great pestilence and famine. 331 B.C. a bushel of wheat was sold for 400 pieces of silver.

336. Syria, famine and plague.

351. Antioch, famine and plague during reign of emperor Theodosius the Great.

1052. India, during the reign of Masaood i., great drought followed by famine; whole countries depopulated.

1052-1060. Seven years' drought in Ghora; the earth was broken up, and many men and animals perished.

1215. Famine of a severe kind is said to have lasted from Samvat 1204 (A.D. 1148) to Samvat 1215.

1291. A terrible famine about Dehil, from drought.

1299. Persia ravaged by pestilence and famine.

1357. China, a famine and plague.

1342. Famine in Dehil, very severe.

1344-45. Famine over all Hindustan; very severe in the Dekhan; the emperor Muhammad was unable to obtain the necessities for his household.

1412. In the Ganges, Jumna, Doab, great drought, followed by famine.

1471. Famine in Orissa. There is vague mention of great famines in the 13th, 14th, and 15th centuries, notably one in 1471.

1491. A great famine in Hindustan about this date.

1521. A very general famine in Sind.

1540-43. A general famine in Sind during these years.

1581. Persia desolated by famine and plague.

1598. In Pegu, very severe.

1630. The records of the East India Company mention a severe famine in Surat in A.D. 1630.

1631. Famine in India general by drought and war, and throughout Asia.

There can be no doubt that one of the great historical famines affected India about the year 1631, in the reign of Shah Jahan. During the wars in the Dekhan which that ruler carried on against the Murtaza Nizam Shah of Ahmadnagur, Muhammad Adal Shah of Bijapur, and Kutub Shah of Golconda, a destructive famine desolated the Dekhan. It began from a failure of the periodical rains of 1629, and was raised to a frightful pitch by a recurrence of the same misfortune in 1630. Thousands of people emigrated, and many perished before they reached more favoured provinces; vast numbers died at home; whole districts were depopulated, and some had not recovered at the end of forty years. The famine was accompanied by a total want of forage and by the death of all the cattle; and the miseries of the people were completed by a pestilence, such as is usually the consequence of the other calamities.

1661. A.D. Dow mentions a severe famine in the Moghul empire in A.D. 1661, caused by drought.

1703. In the Thar and Parkar districts of Sind.

1753. In the N.W. Provinces.

1795. Dehil and neighbourhood.

1754. In the Nara, Thar, and Parkar districts.

1770. Bengal suffered in the year 1770 from famine, more widespread and terrible than any which had ever beforefallen any other British possession, and which Colonel Baird Smith deemed to have been the most intense that India ever had experienced, and one-third of all Bengal lay waste and silent for twenty years.
FAMINES.

The crops of December 1768 and August 1769 were both scanty, and prices became very high; and throughout the month of October 1769 hardly a drop of rain fell. The usual refreshing showers of January to May also failed in 1770, in which year until late in May scarcely any rain fell. The famine was felt in all the northern parts of Bengal as early as November 1769, but by the 4th January 1770 the daily deaths from starvation in Patua were up to 50; and before the end of May, 150. The tanks were dried up, and the springs had ceased to reach the surface, and before the end of April 1770 famine had spread desolation. In Murshidabad, at length, the dead were left uninterred; dogs, jackals, and vultures were the sole scavengers. Three millions of people were supposed to have perished. It is also said that within the first nine months of 1770, one-third of the entire population of Lower Bengal perished for want of food. According to Grant, one-fifth of the entire population perished; according to Miss Carolus, two-thirds; while Ward and Marshman state one-third. The year 1770 corresponds to the Bengali year 1276, and it is known to this day amongst the people as the Che'hattar Saler Durbiyka Manwantar. It was during the governorship of Mr. Carter; his Government did nothing to help the people, and the Company's servants trafficked in grain. The executive civil administration was conducted by native officials, who temporarily remitted 8,000,000 of rent. Another famine occurred in Bengal in A.D. 1783, and again in 1788.

1781-83 A.D. Famine and scarcity in Karnatic and Madras districts, caused by the incursions of Hydro Almas. During 1789 and in October 1783 a terrible famine occurred in all the countries from beyond Lahore to Karunmara, the western boundary of Behar. The famine had been already felt in all the western districts towards Delhi; to the north of Calcutta, the crops had been nearly burned up. 1785. A million of people are said to have died of famine in the Panjab. 1787-88. Famine prospects in Behar and N.W. Provinces from excess of rain and floods. Export of grain prohibited. There have been four famines in Ganjam within historical recollection; the first, 1789 to 1792; second, 1799 to 1801; third in 1836; and the fourth in 1865-1866. Of these, the first was the most severe, far surpassing in intensity that of 1866. In the third period of scarcity in Ganjam, in 1836, cholera was very prevalent, and many of the cattle also perished. The great famine which desolated Bengal, 1770-72, did not extend to Ganjam. The extent of the famine of 1791-92 is not anywhere exactly given. 1790-91 A.D. A very severe famine in Baroda and adjoining districts; many people emigrated, others destroyed themselves, some ate their own children. 1791. In Cutch, a famine was caused by innumerable black ants, which almost destroyed vegetation. 1790-92. Serious dearth in the northern districts of the Madras Presidency from November 1790 to November 1792; many deaths from starvation; grain exports from Tanjore prohibited, and Government distributed rice.

1802-4. Famine in the Nizam's dominions. In Cutch, the crops were destroyed by locusts; in Pulicat, Rewa, Khunds, and Gour, by inundations; in Hyderabad, Belgaum, and Ratnagurh, by want of rain. Kandesh was overrun by the armies of Holkar and the Pindaris, and famine raged in Ahmednagar, Poona, and Sholapur; and in Satara, Kolhapur, Dharwar, and Kolaba, a great multitude of starving immigrants caused scarcity.

1804-7. In the Bombay Presidency, 1804 was an unfavourable season, and the following year a general failure of crops occurred; famine was severe about Poona, Ahmednagar, and the scarcity did not cease till October 1807.

1812-13. In 1810 flights of locusts had appeared in the Bengal provinces, from which they passed through the southern parts of Hindustan, and in fifteen months arrived in Cutch. In 1811 the annual rain failed in Marwar, and the locusts entered Patan, in the N.W. of Gujerat, and from thence followed Kattyawar, and on one occasion they appeared as far south as Broah, but they disappeared with the beginning of the monsoon of 1812. The destruction was deplorable, and the mortality amongst the Gujerat people and the immigrants from Marwar was immense.

1812-13. Famine prevailed in parts of Cutch, Palanpur, Ahmadabad, Mahikanta, Kattyawar, and Broah. In Cutch and Palanpur and Broach it was aggravated by locusts. In Kattyawar it was followed by a plague of rats; Ahmadabad was overrun by starving immigrants, and the Gujerat was increased by the exportation of grain.

1813-14. In many parts of the Agra district the 1812 autumn crop failed, and the spring harvest of 1813 was indifferent, and this was followed by excessive rains.

1819-20. Bundelkhand kharif crop failed, and frost nipped the spring crops of 1820.

1820. Failure of crops in Ahmadabad and Sawuntwari, caused by excessive rains.

1820. In Nagpur, the price of jowari rose from Rs. 5 to Rs. 30 per catty (As. Journ. 1820, ix. p. 79).

1822. Partial drought in Upper Sind, causing famine.

1824. Famine in parts of Behar, Delhi and neighbouring provinces of Hindustan, in the Karnatic and western districts of the Peninsula.

1825-26. In the N.W. Provinces, Saugar, Nerbailla, from want of rain, caused by blight and thunder-storms.

1833-34. In some of the N.W. Provinces; in Ajmir not one shower fell in 1832. In 1833, drought swept in Bundelkhand and Cawnpore.

In 1824, 1830, and 1831, Madras town suffered from dearths, approaching to famine. In 1766 the British had acquired possession of the delta of the Kistna or Krishna river, and from that time for eighty years famines repeatedly occurred, destroying the people. That which occurred in Guntur in 1833 was described by Captain Best. In this famine 150,000 human beings died of starvation, also 74,000 bullocks, 150,000 milk cattle, and 300,000 sheep and goats. The loss of revenue occasioned to Government during the 15 following years exceeded two and a half millions sterling (Mad. Lit. Trans. 1844, No. 30, p. 186; As. Journ., new series, vol. xii.). The famine of 1833 extended southwards to Madras, where its severity
FAMINES.

was intensified from January to September 1833 by the arrival of thousands, and at one time 59,817 starving people were fed.

1834. In Cutch, Ahmedabad, caused by locusts.

1835. In Broach, caused by excessive rain.

In 1838 a famine occurred in the N.W. Provinces. In 1837 the autumn harvest was scanty, owing to insufficient rainfall, and the spring harvest wholly failed from want of rain, and many emigrated, and the cattle perished. Government alone gave in cash Rs. 44,000, but remitted and abandoned revenue to 17 lakhs.

In the famine year of 1837–38, the gross value of the crops saved by the waters of the Jumna canal was estimated at £1,402,800, of which about one-tenth was paid to Government as land and water rent, while the remainder supported the inhabitants of nearly 500 villages.

1839–54. Great scarcity in Bellary district, caused by failure of 1839 rains.

1860–61. In 1859–60 the Delhi territory suffered from want of rain; the 1860 rains completely failed between the Jumna and the Satlej, from Peshawur to Cawnpur, a range of 800 miles, and an area of 25,000 square miles. Great Britain subscribed £108,800.

1861–62. Scarcity in Cutch and other Bombay districts from failure of 1861 rains, and short fall in early part of 1862.

1866. Awful famine occurred in Orissa from drought, and the lower parts of Bengal and Behar also suffered.

The rains of 1865 were scanty throughout the lower provinces of Bengal and on part of the Madras coast, and in Orissa they ceased on the 14th September. In Orissa the total fall was much below the average, and prices rose to famine rates, and in Balsore and Midnapur grain robberies became frequent. Orissa, 200 miles long, has an area of 8518 square miles, and before the famine its population was estimated at 3,015,826, of whom 814,469 perished and 115,028 emigrated. The deaths were 27 per cent. Of these victims a very large proportion perished in the north-eastern districts of the province. In the Madras division of the country the mortality was lessened by successful measures; and it is estimated, therefore, with only too much probability, that in some parts of the Bengal division three-fourths of the entire population had been swept away. During the scarcity and famine in Orissa, in Nuddes, and Midnapur, the starving people fled to Calcutta, where not fewer than 20,000 people were at one time fed daily.

The two earlier famines of 1789 and 1800 began in the north of the Ganjam district, and increased in intensity towards the south; whilst that of 1836, as in 1866, was felt with greatest severity in Orissa and parts of the district adjacent to Bengal.

Cuttack, Puri, and Balsore were the three districts of Orissa—omitting the hill tracts—in which the famine raged with greatest intensity, and continued longest. Mohurthunj is a very large territory, covering an area of upwards of 4000 square miles, and the greater part of this tract was included in the area of most severe suffering. In Chota Nagpur, in which are the districts of Manbhum and Singhbhum, the mortality for the famine of 1866 fell on the population about the same as in Orissa.

In 1866 a severe drought prevailed over all Rajasthan, the Central Provinces, the N.W. Provinces, including Meerut and Delhi. The harvest of 1867 was scanty, and that of 1868 failed. Rajputana, with its area of desert and its scanty water supply, was most affected. It is usual in times of scarcity for the population of the more arid districts to migrate to the more fertile states, but on this occasion all were alike parched by the drought, which was the most calamitous on record. Thousands of the famine-stricken poured into British territory in search of food, greatly aggravating the burden already felt there. In the Central Provinces, the drought, though less severe, was general. The northern parts of the N.W. Provinces, and those bordering on Rajputana, suffered most; in the Panjab, those south of the Satlej. The famine of 1868, in Rajputana, in severity surpassed that of 1813, which was the most calamitous in Rajputana of which they had record. It was most severely felt in Marwar, the northern portion of which was deserted.

1871–2. An intense famine prevailed in Persia. The harvests of 1869, 1870, and 1871 proved deficient from various causes. The slight fall of rain had diminished the natural reservoirs, and many of the invaluable subterranean canals fell dry. The Persian population live much on fruit, but in Isfahan the fruit harvest was a failure. Thus cereals, water, and fruit were cut off.

1874. Bengal suffered from drought. In 1871 the rainfall had been excessive, but in 1872 it was deficient.

In 1873, also, in Bengal and Behar, the autumn rains were scanty, and in 1874 frost and west winds dried up the crops. In those two causes a scarcity of rice occurred. Sir George Campbell, then Lieut.-Governor, Sir Richard Temple, and the Viceroy, Lord Northbrook, arranged for the importation of rice, of which half a million of tons were poured into the districts where scarcity prevailed, obtained from the Panjab, N.W. Provinces, Madras, and Burma; the last-named district alone sent 289,534 tons. Fifty miles of railroad were constructed at the rate of a mile a day; military officers were employed to aid in the distribution, private charity largely aided, and hardly twenty persons died. The population in reality lived on other grains and pulses. But it cost the Government about nine millions sterling. Macaulay, noticing the former famine there, says—'In the summer of 1770 the rains failed; the earth was parched up, the tanks were empty, the rivers shrank within their beds; and a famine, such as is known only in countries where every household depends for support on its own little patch of cultivation, filled the whole valley of the Ganges with misery and death. Tender and delicate women, whose veins had never been lifted before the public gaze, came forth from the inner chambers in which Eastern jealousy had kept watch over their beauty, threw themselves on the earth before the passers-by, and with loud wailings implored a handful of rice for their children. The Hoogly every day rolled down thousands of corpses close to the porticoes and gardens of the English conquerors. The very streets of Calcutta were blocked up by the dying and the dead. The lean and feeble survivors had not energy enough to bear the bodies of their kindred to the funeral pile or to the holy river, or even to scrape away the jackals and vultures who fed on human remains in the face of day.'
FAMINES.

1874-75. Severe famine in Asia Minor; the deaths up to July 1874 were 150,000.

1877-78. One of the most severe and most extended famines on record occurred in the Peninsula of India, in the Madras Presidency, Mysore, part of the Bombay Presidency, and lasting from the end of 1876 till the middle of 1878.

The 1876 S.W. monsoon rains were deficient all over the Madras Presidency and in the Pondicherry district, and the N.E. rains utterly failed. The drought in Bombay extended to nine districts in the Dekhan and Southern Mahratta country, including Kandes, Nasik, Almadnagar, Poona, Sholapur, Satara, Kaladgi, Belgaum, and Dharwar; and adjoining native states, Kolhapur, Phaltan, Akulkote, and Sawantwari, also suffered. The area of this territory, exclusive of native states, comprises about 54,000 square miles, and the total population amounts to eight millions, of which five millions were included in the tracts immediately affected. By October 1876 all the nine of the Bombay Dekhan districts were threatened with famine, as nearly all the monsoon crops had perished, and the spring and summer rains failed, and rain fell short all over India; there were scarce rains also in Egypt, Morocco, and Brazil. In Madras famine affected the districts of Cuddapah, Bellary, Nellore, Kurnool, Madura, North Arcot, Salem, Chingleput, Coimbatore, Kistna, Trichinopoly, and Tanjore. In Mysore, and also some part of the Nizam's country, the area of the distressed districts amounted approximately to 80,000 square miles, and the total population affected to nearly 18 millions.

In the beginning of 1878, a trial census was taken of the districts of N. Arcot, Bellary, Chingleput, Coimbatore, Cuddapah, Kistna, Kurnool, Madras town, Madura, Nellore, and Salem. In these, in 1875-76, the deaths were 340,545; but in 1876-77 they increased to 925,163, or 67 per thousand of the population of 13,765,163. According to the estimated population at the end of 1876, the losses were in Bellary 21 per cent.; Kurnool, 27 per cent.; Cuddapah, 26 per cent.; Nellore, 21 per cent.; Coimbatore, 17 per cent.; Chingleput, 10 per cent. The Salem district estimated population in 1876 was 2,129,850. The actual population on the 14th of March 1878 was 2,150,850; but as there were 662,950 souls in this district, or nearly 27 per cent. of the people, unaccounted for. And in this Salem district the famine distress was not then over.

In Mysore the January census showed that about 25 per cent., or one-fourth, of the population had melted away, equal to 1,250,000 souls. In Bombay the average deaths had been 32,909; but in the year 1876-77 the mortality was 149,053, and there were 32,054 diminished births.

In Oudh, the N.W. Provinces, the Punjab, and Central Provinces, the deaths were abnormally great. Great efforts were made to relieve the famine-stricken. The people of Great Britain subscribed about £800,000; the Government of India laid out about £10,000,000; and private individuals and the public servants in India vied with each other in efforts to save life.

The loss in cattle was very great. In Bellary the Madras Board of Revenue considered it unlikely that more than 25 per cent. of non-agricultural cattle, and from 60 to 70 per cent. of the agricultural cattle, would survive.

1877-78. An appalling famine prevailed in the N.E. parts of China, chiefly in the provinces of Shan-si and Hon-nan. Out of a population of 70 millions, 9 millions of people were reported to be destitute, and 7 million persons in all are computed to have died. The province of Shan-si alone is said to have lost 500,000 of its inhabitants in one winter. Women, girls, and boys were sold in the market for 2 to 5 dollars each, and many killed their children and then themselves. It was severest inland from the Yang-tze to near Pekin, and east to Corea. In Shan-si, in 1877, the dead could not get a burial; they were too many, and none could afford the expense, so they were cast daily into large pits. The people at Shan-si, in 1873, were said to be living on the corpses of their fellow-beings who died of starvation. And the strong were killing the weak for the sake of obtaining their flesh for food. It was accompanied by locusts.

In Kashmir, also, through the year 1878 it was very severe. The last previous famine in this state was about the middle of the 18th century. 1879. The swarms of rats which from January to March swept through the country between Sind and Mysore, are stated by a contemporary to have destroyed quite 50 per cent. of the crops in the agricultural land which they passed over. The length of their journey was not less than 1000 miles. Sir Arthur Cotton estimated that two acres of rice land would feed seven people for a year; and Mr. Fieschi considered that a family of five will consume under 9,000 grains per day. The fields of India yield quantities of the better grains, such as rice and wheat, but, except in Burma, these are used only by the well-to-do classes, the producers living on the coarser grains, pulses, and millets. And food at three times its ordinary price, at a season when some months must elapse without relief, means famine in the great majority of cases; while in some cases famine comes long before that rate is reached. When the rate rises to four times the ordinary standard, it is probably accompanied by famine of a very severe description. After the 1877-78 famine in India, a commission was appointed to report how 'Government might by its action diminish the severity of famines.' They calculated that India regularly yields a surplus of food, more than enough to supply a death in any particular district. But they avowed their conviction of the incapacity of any human endeavours altogether to prevent or abate the effects of a famine. In 1873 alone, an outlay of six millions and a half sterling averted an increase of mortality. But with the solitary exception of 1878, famine in India has been too strong for the State to bar its devastations. For a famine at Cawnpur, a million and a half sterling of subscriptions was realized and distributed; 1300 were fed daily, but 1200 persons died.

A larger proportionate expenditure was made by the State on the relief of the famine in Orissa in 1866 than on any previous occasion, yet nearly a million persons died.

By the famine of 1868-69 in the N.W. Provinces and the Punjab, and by the diseases which are the followers of famine, though enormous sums were spent on relief, 1,200,000 lives were lost.

Unless when a region is dependent upon rain for its fertility, and the rainfall fails, the soil in India yields the husbandman his fair return. In Sind the rainfall is always meagre. So Sindh has learned to trust to artificial irrigation from the Indus, and Sindh is safe from famine. Assam and Burma, the country between the Western Ghats and the sea,
Famines.

The immediate effects of famine soon disappear. An Indian population grows normally at the rate of 1½ per cent. per annum, and this proportion is within the mark in ordinary times. And within two years of the great famine of 1877-78 its injuries were no longer apparent, while calamities of other kinds continue to be remembered for long periods.—Army Sanitary Comm. Rep.; As. Soc. Journ.; As. Res.; Hunter's Rural Life in Bengal; Famine Comm. Rep.; India Administration Rep., vol. xii.; Proceedings of the Government of India; Saturday Review, 1878; Sanitary Commissioner of Madras, Report; Dr. W. W. Hunter in Geog. Magazine; Montgomery Martin’s Famine Chronology, 1640 to 1841; Statistical Journal, 1843, i. 3d series, p. 488; Macmillan’s Magazine; Geog. Mag., May 1877; Kaff Khan; Elphin. p. 510; W. H. H. Hinton, iii. p. 107. See Food.

FANAM. A silver coin of the Karnatic, now current, the falam of the Tamil race. The correct value of one Company’s rupee was 12 fanams 68-57 cash. Where much nicety was not required, the usual rate of conversion was 1 fanam = 1 anna 3 piec. It was a small silver coin, the 1-12th of a rupee; no longer coined.

FAN PALMS. The Chamerops humilis, Linn., used for this purpose, grows in considerable abundance on the shores of the Mediterranean. The leaves of many of the palms of Southern Asia—the Corypha, the Livistonia, palmyra, and date palms—are similarly employed. That of Ceylon is the Corypha umbraculifera, Linn.

Faqeer. Fakir, Darvesh or Dervis, amongst the Mahomedans, religious orders or communities, of whom there are several sects. In India only ten classes are generally met with. The Kalandar darvesh are rarely seen in India.

Fakir is from Fakhr, A. The Persian name Darvesh is from Dar, a door, and Vhtan, to beg. There have been many branches and orders. Jalal-Din founded the Mulavi order. In European Turkey, they have formed somewhat permanent communities, and about sixty different orders, each named after its founder, are supposed to exist there. The Batashi of Constantinople are said to be quite atheistic, not attached to the principles of the Koran, nor firm believers in Mahomed as a prophet. They are generally of the Shahi sect of Ali, and are Sufi or Mahomedan spiritualists. The Rafai darvesh, in Turkey, inflict on themselves great self-torture. Some of the wandering Indian fakirs wander so far west as Hungary, to visit the shrine of a santon, Gil-bata, and they sail to Tenasserim and Burma. One whom the Editor met near Hingolee, in the Dekhan, was a native of the Panjab, but had been to Ceylon, Mergul, Tavoy, Rangoon, and Mount Benne. The fakirs in India are now a low, prodigal set of men, held in great disesteem by all classes of the community, and some of them are utterly degraded in habits and mode of life. The bulk of them are Be-Sharra, literally without law, i.e. do not act up to the precepts of Mahomed, but are latitudinarians; a few are Ba-Sharra, or with law, following Mahomedanism. The latter are the Salik. The Be-Sharra are styled Majzub, Azad, Ras-us-Shahi, Imam Shabi. The Kalandars are of both sects. Some of the fakir take up their residence in burial-places, which they create, or of which they become the proprietor or makandar; or they reside in an aasthan or a takin.

The tract immediately east of the Ghats, the valley of the Nerbadda and the Tapti, enjoy rains or river floods, which have never deserted them. Eastern Bengal, in the parts between the Ganges and the Jamna, is now completely protected by its irrigation canals. It is the portion of India with a total average rainfall from 20 to 35 inches which is subject to drought when the south-west monsoon fails, and consequently is the prey of famine. No past famine has been more intense than that of 1876-78, so none may exceed it in the future. On that presumption, the largest population likely to be severely affected by famine at one time is put at 30 millions. An estimate for relief on a scale double that given in Madras and Bombay during the last famine, shows four and a half millions as the maximum number of objects of relief in the height of the famine, and from two to two and a half millions as needing aid for the space continuously of a year.

For each working adult male of this mass the commissioners compute that a pound and a half of flour or rice is sufficient; for a man doing light work, a pound and a quarter; and for a man doing none, still less. A woman needs rather less than a man, and children from half to a quarter the quantity, according to age. The commissioners recommended that for all who can work, public work should be provided, at fixed reasonable wages, the same for all, and ‘on which life and health can be maintained.’ Piece-work, unless as an experiment, they refused to recommend. The works selected should be of permanent utility, and contiguous to the dwellings of those to be employed upon them. The true policy is to begin a series of comprehensive or connected undertakings of permanent utility, and to entrust their construction to professional engineers, who shall take care that none but the able be employed, and that they be paid regularly in money for a fair day’s work. An unfinished canal in Orissa in 1871-72 sufficed to irrigate 100,000 acres, on which 750,000 cwt. of rice was grown.

The impression generally prevailing, that the preservation of life by Government measures of relief in Indian famines, is entirely a question of money, is erroneous. The same atmospheric conditions which produce a scarcity of food, produce also epidemic diseases; secondly, a larger proportion of the mortality of a famine season is due to epidemic diseases than to absolute deficiency of food, although their destructiveness is increased by the people being, from want, less able to withstand them; and thirdly, a point in the process of chronic starvation, when nutriment can no longer save life, is often reached before the people can obtain, or will seek, relief from their communities, after their homes. After the famine of 1877, the Indian Government endeavoured to ascertain approximately the deaths it had caused, and by enumerating certain districts, with the following result:

<table>

7076
The Kadria or Banaw profess to be the spiritual descendants of Sa'id Abdul Kadir Jilani of Baghdad. The Chisti are followers of Banda-nawaz, whose shrine is at Kulburga; they are usually of the shiah sect. Sutarian are descendants or followers of Abdul Shütar-i-nuk. Tabkatia or Madaria, followers of Shah Madar; many of the Madaria are jugglers, also bear or monkey leaders. Malang are descendants from Jaman Jati, one of Shah Madar's disciples. Rafai or Gurzmar are descended from Sa'id Ahmad Kabir Rafai, who seem to beat, cut, and wound themselves without betraying suffering, and who, in the belief of the faithful, can cut off their own heads and put them on again. Jubbia, followers of Sa'id Jadal-ul-Din Bokhari. Sohagia, from Musa Sohag, dress like women, wear female ornaments, play upon musical instruments, and sing and dance. Naskhi-ban via, followers of Baha-ul-Din of Nakhshband, distinguished by begging at night, and carrying a lighted lamp. Bawa piri dresses in white. There are other distinctions. At the Maharram a number of the lower classes assume the character and garb of fakirs of different ridiculous personages, for the amusement of the populace and the collection of contributions.—Wils.; Kanoon-i-Islam. See Darves; Sufi; Esawiah.

FARQH. Arab. A doctor of law; in Spanish, the faqih.

FARABATUN, a Christian priest, whom Abul Fazl names Padre Farabatun, and describes as learned in science and history. Akbar prevailed on him to come from Goa to undertake the education of a few youths destined to be employed in translating the productions of Greek literature into Persian.—Elph. p. 468.

FARK, the valley from which the Jabli-Musa range rises. That part of the range on which the Convent of St. Catherine is built is called Tur Sina. See Jubbil-Musa; Senai.

FARARI. Pers., Hind. Absconding, disappearance; a person who has disappeared. Faut-i-farari, casualties by deaths and disappearance.

FARAS. Hind. The tamarisk plants. Tamarix orientalis and T. dioica, in the drier parts of the Doab and in the vicinity of Dehi, are called Asul or Atul; and the galls, or choti-mai, which are formed on the tree are called Samrat-ul-aasul in Arabic.—Elliot.

FARASH. Pers. A carpet; hence Farash, a carpet-spread. But in Persia, Afghanistan, and India, applied to under-servants generally. Amongst the Mahomedan armies the Farash was a tent-pitcher, which in the British camps is the duty of the lascar or khallasi.

FARAZ. Arab. In the Mahomedan religion, points ordered by God—God's commandments; Sunnud being the ordinances of their prophet. For instance, the Ramzan or Eed-ul-Fitr feast and the Bakr-eed feast are alike Farz and Sunnud, while the Akhi-char shamlah, the Maharram, and the Shah-i-Burat are only Sunnud. Thus, also, Captain Burton says, the afternoon prayers being Farz, or obligatory, were recited, because we feared that evening might come on before the ceremony of Ziyarat (visitaton) concluded. Throughout India, the Farz, or commands of God, are almost obscured by the quantity of the Sunnud and the traditions, and there are frequent reforms attempted, but these speedily assume political features. A sect styled Farazi, or Faraizi, was formed at Dacca in 1828. Daulatpur village, in Faridpur district of Bengal, was the birthplace of Haji Shariat-ulla, the founder of that Farazi sect, which rapidly spread throughout the whole of Eastern Bengal. The Faraizi are a branch of the great Sunni division, and in matters of law and speculative theology they belong to the school of Abu Hanifa, one of the four authoritative commentators on the Koran. They reject traditional customs, declare that the Koran is the complete guide to spiritual life, and they therefore call themselves Faraizi, or followers of the Faraiz (pl. of Arabic Farz), the divine ordinances of God alone. The majority of Musalmans in the delta of the Ganges and Brahmaputra are descendants of the aborigines, who retained many of the superstitious ceremonies of their former life. The reformation inaugurated by Haji Shariat-ulla was a protest against such pagan practices, and a return to the simple habits and monotheism of the Koran. He insisted on the duty of the holy war (jihad), the sinfulness of infidelity (kufr), of introducing rites and ceremonies into worship (bid'at), and of giving partners to the one God (shirk). Externally a Faraizi may be known by the fashion of wrapping his dhoti or waist-cloth round his loins without crossing it between his legs, so as to avoid any resemblance to a Christian's trousers, and by his ostentatious mode of offering prayers with peculiar genuflexions in public. The rapid spread of the Faraizi movement in the lifetime of its founder affords sufficient justification for his enthusiasm. The majority of them are cultivators of the soil, but not a few occupy the rank of traders, being especially active in the export of hides. All alike are characterized by strictness of morals, and faithful promotion of the common interests of the sect.—Elliot; Wilson; Burton's Mecca, ii. p. 60; Imp. Gaz.

FARD. Arab. Any single thing; in accounting, a slip of paper, a list, a sheet, a slip in an account book, a statement, an account; a single long shawl, as opposed to Do-shala (q.v.).

FARDUSI, a celebrated Persian poet. He wrote the Shah-namah in the 11th century, containing three heroes, Jamshid, Faridun, and Garshasp, as the three earliest representatives of the generations of mankind. See Ferdusi.

FARFYUN. Hind. Gum of Euphorbia Cauniensis and other species. Its Persian name is Shiri-i-darakhht-i-zakum, and Arabic, Akal-nafsah. The Euphorbium known in Europe is very likely the juice of E. Cauniensis, but that of the bazaars of India is produced from E. antiquorum and others. It is used as a remedy for rheumatism.—Porell.

FARFUGIUM GRANDE. Lindley. A beautiful new herbaceous plant, having rich blotched or variegated leaves.—Fortune's Res. p. 420.

FARGARD. Pers. A section of the Vendid-dad, the sacred book of the ancient Zoroastrians.

FARGHANAH. Baber's ancestral dominions were on both sides the Jaxartes, a portion of ancient Sakatari or Sakaedwa (Scythia), where dwelt Tomyris, the Getic queen, immortalized by Herodotus, and where her opponent erected Cyropolis, as did in after times Alexander the Macedonian his most remote Alexandria. From this region the same Gete, Jit, or Yuti, issued to the destruction of Bactria, two centuries before the Christian era.
and again in the 6th century to found a kingdom in N. India. A thousand years later, Baber issued with his bands to the subjugation of India, which his descendants retained up to the end of the 18th century. This portion of Central Asia is the officina gentium whence issued those hordes of Asi, and of the Jit or Toot (of whom the Angles were a branch), who peopled the shores of the Baltic, and the precursors of those Goths who, under Atilla and Alanic, altered the condition of Europe. Baber quitted Samarcand as a fugitive, and with less than 2000 adherents commenced his enterprise, which gave him the throne of the Pandu.—Malcolm's Persia.

FARHAD and Shirin, two lovers in a Persian story, fabled to have their tombs near Kumbi-Shirin, a pool in Las, in the great Lak or pass connecting that province with the western district of Jao.

FARIA, MANUEL DE, author of the History of the Discovery and Conquest of India by the Portuguese, written in Spanish, and translated into English by John Stevens.—Playfair's Aden.

FARIDKOT, one of the Sikh states under the political superintendence of the Panjub Government, lying between lat. 30° 18' 30" and 30° 50' N., and between long. 74° 31' and 75° 5' E.—Imp. Gaz.

FARIDPUR, a revenue district in Bengal, lying between lat. 22° 47' 53" and 23° 54' 55" N., and between long. 89° 21' 50" and 90° 16' E. Area in 1877, 2365 square miles; pop. in 1879, about 1,502,436. Of its various races the Chaudals are numerous. They are capable of great fatigue. They are a despised race, and a Brahman thinks himself defiled by even crossing the shadow cast by a Chaudal; but in 1875 they organized a general strike in the district, resolving not to serve the upper classes until their own position was ameliorated. The Bunas, another aboriginal race, number 2412. See Faraz.

FARID-ud-DIN, styled Sherk-Ganj, a Mahomedan saint, whose shrine is at Ajodhan, on the bank of the Sutlej. See Pak Pattan.

FARIGH. ARAB. Release, free. Farigh nama or Farigh khatti, deed of release. From this word also is the word Faraghat, leisure, enjoyment, repose, alliance; also Farigh-khatana, a fee to the writer of a Farigh khatti.—Elliot.

FARINA. Eng., Lat., Sp. Flour, meal; any flour used as food, either from wheat, rice, janthia, potato, jatoba, maranta, curcuma, canna. Every now and then some one of the farinas is prominently put before the public as a novelty. Semolina consists of the gluten of wheat, with a proportion of the starch, part of this having been removed. Semolina resembles in appearance sago; but the little granules of which it is composed, in place of being round as in sago, are angular. When moistened, the water is rendered perceptibly opaque and milky by the starch still present, and the fragments swell up and become soft and glutinous. See Eryum.

FARING. Hind., Pers. Europe, from the old term Frank. Hence Faringi, a European, or relating to Europe.

FARMAN. Pers., Hind. A royal mandate; an order from a king or other superior, which the British write Firman.—Elliot.

FARMS of an experimental character have been formed by the British Indian Government, since the middle of the 19th century, for the object of improving the agricultural knowledge of the people, at Sydapet near Madras, Nagpur, Kandesh, Sind, Darwar.

FAROKHSIR, or Mahomed Farokhsir, emperor of Delhi, was the son of Azim-us-Shan. He ascended the throne on the 4th February 1718, after defeating and putting to death his uncle, Jahandar Shah. In Delhi he tortured to death Banda, the Guru of the Sikhs, the successor of their Guru Govinda, and beheaded 700 of his followers. When the empire began to totter, he furnished the last instance of a Moghul sovereign marrying a Hindu princess, the daughter of raja Ajit Singh, sovereign of Jodhpur or Marwar. To this very marriage the British owe the origin of their power. When the nuptials were preparing, the emperor fell ill. A mission was sent at that time to Delhi from Surat (1715), where they traded, of which Mr. Hamilton was the surgeon. He cured the king, and the marriage was completed. In the oriental style, he desired the doctor to name his reward; but instead of asking anything for himself, he merely asked a grant of land for a factory on the Hooghly for his employers. It was accorded; and this was the origin of the greatness of the British empire in the East. Such an act deserved at least a column. Farokhsir was deposed and murdered on the 16th February 1719, by Abdullah Khan and Husain Khan. His feeble, brief reign was disturbed by the intrigues of these Syuds of Barh, Abdullah Khan and Husain Ali.—Elph. pp. 610-612; Tod's Rajasthan, i. p. 152.

FARQAH, a tribe, from Arab. Farg, separation. Hence also Faraqat, separation; Faraqat behtar az mululat, Absence is preferable to quarrelling; also Farq, the part on the crown of the head where the hair parts.

FARRAH-RUD, a river of Afghanistan, which rises in the mountains in the unexplored country of the Taemuni, and, after a course of 200 miles, falls into the lake of Seistan.

FARRAKHABAD, a town in the N.W. Provinces of British India, in lat. 27° 20' 35" N., and long. 79° 36' 50" E., with a population of 78,204 souls. It gives its name to a revenue district, lying between lat. 26° 4' 31" and 27° 20' 36" N., and between long. 76° 9' 59" and 80° 3' 50" E. Area, 1744 square miles, with a population in 1872 of 918,850 persons. It possesses great antiquarian interest, owing to the presence within its boundaries of Kanouj, the capital of a powerful Hindu kingdom in the earliest centuries of the Christian era. Amongst the tribes, the Baniya number 15,717; Azhirs, 36,372; Chamars, 94,274; Kayasthas, 15,378; and Kurmi, 80,884.—Imp. Gaz.

FARS, Pars or Farsistan, is the province of the kingdom of Persia which gives its name to the country. It lies between lat. 27° 20' and 31° 42' N., and long. 49° 20' and 54° E., being about 220 miles in length and breadth. It has Kirman and Luristan on the east, the Persian Gulf on the south, Khuistan on the west, and Irak-Ajam on the north, with a superabundance of about 44,353 geographical square miles, or nearly one-fifth of France. It has many rich and picturesque tracts, and is less desert than other parts of Persia. This province of Persia contains the salt lakes of Bakhtegan (called Niriz) and Dervaeche,
which are in the neighbourhood of Shiraz; and there is a fresh-water lake in the plain of Zerdan. The principal streams are the Bendamir or Araxes, which receives the Kur-ab or Cyrus river, as it falls into lake Bakhtegan, and the Nabun, whose course is from Firozabad southward to the Persian Gulf. In this province are also the higher parts of the two branches of the Tab. Towards the north (according to Mr. Morier) Madar-i-Sullman marks the tomb of Cyrus (son of Cambyses); to the west are the ruins of Khiz Safed; and nearly in the centre are those of the ancient capital, Persepolis. This territory represents ancient Persis, which was watered by the Araxes, Gyndes, Oroatis, Artas, Ates, Chelvar, and Bagrad. Its cities were Corna, Axina, Ardira, and Artacana, besides many others whose sites are unknown. Persepolis was the capital in the time of Alexander; more anciently, the seat of the government was at Pasargada (Strabo, lib. xv. p. 729), the Persagadis of Quintus Curtius (lib. v. cap. vi.); but as this historian speaks of the fortress of Persepolis, and the city of Persagadia (Farsa-Gerd ?), it is possible that the extensive ruins in the plain, near the former, may be the Pasargada of Pliny (lib. vi. cap. xxvi.). The tribes now inhabiting it are,—

Fellii, 100 houses, Lek, Persians and Lek.
Byat, 120 houses, Turk.
Bergshadi, 50 houses, Turk.
Gurani, 400 houses and tents, Lek.
Kajar Afshar, a mixed tribe of Turk, 250 houses, and Lek 100 houses.
Abulvaridi, 500 tents, smugglers, engaged in trade.
Tewelllele, 40 houses, Turk cultivators.
Amesh, 40 houses, Turk cultivators.
Zargar Lek and Kara Guzu Turk, 100 houses.
Basle, 3500 houses, of Arab descent.
Arab, 7300 tents.
Kashki, 30,000 to 40,000 tents of Turks.
Masamanni, 8000 tents and houses of Lek.

The entire southern region of Fars, bordering on the Persian Gulf, is called the Garmsir. It extends from the sea to the latitude of Kazerun, and runs parallel with the Persian Gulf. From the banks of the Tab to the confines of Luristan, from Bushir eastward as far as Cangoon, the tract is named the Dushsthan, or land of plains. The Tungistan is a small tract of land east of Bushir. The greater portion of the people of the whole Garmsir consists of an independent lawless set, many of the tribes being robbers by profession. A huge wall of mountains separates the Garmsir or low region, from the Sardar or high table-land of Persia. One of the most conspicuous of these is an abrupt lofty hill named Hormooz, where specimens of coal were found. Sardar is also termed the Sardista, a word literally signifying boundary or frontier, but, there, is generally applied to any high land where the climate is cold. The Sea of Oman, or Persian Gulf, called also Persian Sea, Erythrean Sea, also Sea of Fars, has several islands, the Jazirah-i-Lafet, called also Jazirah-i-Daran, or Long Island, known on maps as Kisham; also Khareg Island, on maps Karrack, a small island, but well watered, not very far from Bushir, which once belonged to the Dutch, and was held from 1838 to 1846 by the British.—*Ouseley's Tr. i. p. 304;* Kinneir's *Per. Empire,* p. 64; *Chesney's Ephrates,* p. 210; *Porter's Tr. i. p. 548;* *MacGregor's Persia.*

FAKH. Pers. By the old Greek historians Φάσις. It is the Persian league, about

18,000 feet in length, and is known to Europe as the Farsang or Parang. It is usually reckoned at 32 British miles, but, like the cos of India, it varies greatly. According to Major Rennell, the farsakh is little short of 34 British miles (Illustrations of the Retreat of the Ten Thousand, p. 4). Mr. Fraser (Journey into Khorasan, p. 367) says, The Khorassani farsakh is rather more than that of Irak; rather less than 4 British miles. A farsang is also said to be a distance within which a long-sighted man can see a camel, and distinguish whether it be white or black (Bunchehesh, cap. xxvi.). It is also described as one hour's travel or journey, or three miles.—*De Bode's Tr. p. 57;* Rick's *Lestra* *i. d. p. 197;* Porter's *Tr. i. p. 255.*

FAKHAN, an island off the coast of Yemen, about three miles from the seaport of Jezan. The population are largely occupied in the pearl fishery.

FAKHETI HAMILTONII in the Farid buti, HIND., a Panjab plant, rarely used in medicine. Leaves and stem glaucous, pilose, with pink cruciferous flowers, and broad flattened silique, one of the Brassicaeae.—*Powell, i. p. 329.*

FARUD. ARAB., HIND., PERS. Literally descent or alighting; in the customs department, delivery in of goods.—*Ell.*

FAKHKHI, a dynasty of kings of Kandahar, founded by Malik Rajk, a person of Arab descent.
FASTIKI.

Hind. A kind of emerald.

FASIS form part of the religious practices of Hind. and Mahomedan in Mahrattens. The Hind. festivals called Barth are observed in sorrow for the dead, in honour of Vishnu, Lakshmi, Eswara or Siva, Vigneswara, and Subramanya, son of Siva; and the use of phulaha, certain grains, as buckwheat, etc., is admissible on other fast days, some of which seem to have an astronomical or sidereal bearing. The fasting of Christians consists of abstinence on certain days seemingly from one kind of animal food; but the Mahomedan fast in India (roza rakha) during the month of Ramzan is from before sunrise till after sunset, during which they do not even swallow the moisture of the mouth, and abstain from all enjoyment.

FATAH ALI SHAH was king of Persia up to the year 1828. His life illustrates one phase of Persian customs. He was an eminently handsome man. He possessed one of the largest families on record, in ancient or modern times. Besides the four akad or lawful wives permitted to every Mahomedan, he had more than 800 nauta or inferior spouses. He continually changed his wives, as he was tired of them and lacked novelty; but he never parted with any who had borne him male children. He had upwards of 130 sons, and 160 or 170 daughters. At the time of his demise, his children, grandchildren, and great-grand-children amounted to about 5,000 souls. The descendants of these princes (Shahzade) were long a heavy burden to the country. Scarcely a village of any size in some parts of Persia but had some resident at it. Some have become comparatively well-off, but many fell into great poverty; and some of his descendants have had to earn their living as mechanics and tradesmen in the different cities. August, 10th, of Poland is said to have had 354 children by his numerous concubines. He also had one of his own daughters for his mistress, a piece of depravity of which Fatah Ali Shah was never accused.

FATAH-UL-BALDAN, a historical work on Mahomedan countries from Spain to Sind, by Ahmad, son of Yahya, son of Jabir, styled Al-Biladuri. He was tutor to one of the princes of the family of the khalif Al Mutawakkil, and died A.D. 892 (A.H. 275).—Elliot, Hist. of India.

FATE, the Taqdir, Nasib, Kaza, Kismat, Hon- lar, and Talib of Mahomedians.

FATEHPUR, a revenue district in the N.W. Provinces of India, lying between lat. 25° 26' 17" and 26° 12' 60" N., and between long. 80° 16' 39" and 81° 28' E. In 1872 there were 503,206 cultivable lands, 70,554 unusable. The Kurmar and Kachil together amounted to 89,044. They are industrious and diligent agriculturists. They pay higher rents than any other tribes, and pay them easily. The Ahirs, Lodhis, Arabhs, and Pasi numbered in all 162,907 persons.—Imp. Gaz.

FATEHPUR SIKRI, a municipal town in the Agra district of the N.W. Provinces, and formerly capital of the Mughul empire; population (1872), 6878; lat. 27° 5' 35" N., long. 77° 42' 18" E. It chiefly consists of a vast expanse of ruins, enclosed by a high stone wall some five miles in circuit; amongst them the tomb of Shakh Salim, Chishti, a Musalman ascetic, through whose intercession Akbar obtained an heir, in the person of Prince Salim, afterwards known as the Emperor Jahangir. The tomb consists of an elaborately carved shrine in white marble, enclosing a sarcophagus within a screen of lattice-work, inlaid with mother-of-pearl. On this terrace and, among other noble buildings, the houses of Birbal and of the 'Christian lady'; the Diwan-i-Khas and the Diwan-i-am, or Council Chamber and Hall of Judgment. The Elephant Gate contains two massive figures of the animals from which it derives its name. Close by towers the Hiran minar, a pile some 70 feet in height, covered with enamelled imitations of elephants' tusks.—Imp. Gaz.

FATHER and Mother.

BaBa, Peder(father), Turk.

Pere, Mere, ... Fr. Ana, Nine (mother),...

Vater, Mutter, ... Ger. Thya, Typan, ... Tam.

Ma-Bap, ... Hind. Tili, Taudi, ... Tel.

Pedre, Madre, ... It. Sp.

Among the people of India, and amongst the Chinese, an honorific style of address to people of rank, or to a person from whom a kindness is received or expected. In China it is a title by which the representatives of authority are designated.—Luc, Chinese Empire, 1. p. 22.

FATHOM.

Bu, ... Arab. Braccio, ... It.

Lan, ... Arab. Buroc, ... It. Lat.

Toise, ... Fr. Braza, ... Sp.

Klaffer, Tiefe, ... Ger. Kulbj, ... Turk.

Bam, ... Hind.

This is a natural measure, from point to point of the outstretched hands. It was common to the Greek, Roman, and Indian, and is four cubits in length. The Greeks and Romans had also the foot (pes), the hand (palm), the palm (παχήντα), and the finger (digitus). The Romans also had the military pace; the Greeks and Romans also had the cubit (cubitus). The ancient inhabitants of Asia had, as a unit measure, the cubit or ell, from the elbow to the point of the little finger.
FATIH AH.

All of these—digit (angul), palm, cfi (hath), and span (blish)—are in use in India.

FATIH AH, ARAB, also Al-fatihat, Fatihat, and Fatihat. The name of the opening chapter of the Koran. It is a prayer, and is held in great veneration by Mahomedans, who give it several honourable titles, such as the Chapter of Praise, of Prayer, of Thanksgiving, or Treasure. They esteem it in the quintessence of the whole Koran, and often repeat it in their devotions both public and private, as Christians repeat the Lord's prayer. Most Turkish epitaphs end by the words, 'Fatihah ruhun icin,' say a fatihah for his soul. The fatihah is also entitled the preface of the Koran, or introduction. It was revealed at Mecca, and is as follows, commencing with the words Bismillahir-Rahman-ur-Rahim:—In the name of the most merciful God, praise be to God, the Lord of all creatures, the most merciful, the king of the day of judgment, thine do we worship, and of thee do we beg assistance. Direct us in the right way, in the way of those to whom thou hast been gracious; not of those against whom thou art incensed, nor of those who go astray.' This prayer is offered with upraised hands, which are afterwards drawn down over the face. The hands are raised in order to catch the blessing that is supposed to descend from heaven upon the devotee, and the meaning of drawing the palms down the face is symbolically to transfer the benediction to every part of the body. The Dairah ki fatahah is the cemetery obliteration; the Hazrat shah ki fatahah is on Maula Ali; the Nat khair ki fatahah is the prayer offered for the welfare of any one.—Sale's Koran; Burton's Mecca, i. p. 286; Ferrier's Journey, p. 502.

FATIMAH, daughter of Mahomed, and wife of her cousin Ali. Her tomb at Loms, Armenia, is held by Shah Mahomedans in the highest reverence. The Koran is read there night and day; and nearly the same privileges are offered to the pilgrims as at Mecca. It is a place of pilgrimage.—Chatfield's Hindustan, p. 209; Tavernier, ch. iii. and vi.

FATSIA PAPYRIFERA. Bentham.

The rice-paper plant of Formosa, used to make into the commercial rice-paper, also for sola hats.

FATSIF, or Inaccessible Island, in lat. 33° 6' N., and long. 140° E., a penal settlement of Japan.

FATSIA, or Inaccessible Island.

FATMIIH MAHOMED, a Mahomedan of Sind, who in 1788 dethroned Rahiden, Rao of Cutch, who had embraced Mahomedanism; ob. 1813.—Burnes' Sind.

FAULKNER, ALEXANDER, an officer in the civil service of H. M. Government at Bombay in the middle of the 19th century, author of Commercial Dictionary, a work containing in a small bulk a vast amount of useful information relating to the commercial and economic products of India.

FAYRER, Sir JOSEPH, M.D., LL.D. and F.R.S. London and Edinburgh, F.R.C.P. London, and F.R.C.S. of England and Edinburgh, Fellow of the University of Calcutta, Fellow of the Botanical Society of Edinburgh, Vice-President of the Zoological Society of London, Knight Commander of the Star of India. He entered the British navy on the 12th August 1847, from which he retired; and during the siege of Palermo, from December 1847 to March 1848, he served in its military hospitals. In 1848 he was present in Rome during its siege by the French. From December 1849 till April 1850 he was in the Royal Artillery branch of the British medical service, but resigned and entered the East India Company's service. He was in command of the fleet at Chusan from July to October 1850. During the second Burmese war he was present at the taking of the stockades and the capture of Rangoon, in charge of the field hospital, where he remained for a year as medical storekeeper and civil surgeon. In 1853 he was appointed Residency Surgeon of Lucknow, in which he served in 1857 during its siege by the mutineers. His house was one of the chief garrisons, and 14 were killed and 40 were wounded in it. He was with Lord Clyde at the relief of Cawnpur. He was appointed in 1859 Professor of Surgery and First Surgeon to the Medical College Hospital, Calcutta. In 1858 he was created a Companion of the Star of India, accompanied the Duke of Edinburgh and the Prince of Wales during their travels in India, and in 1876 was created a Knight Commander of the Star of India. He was author of a book on the Indian Tiger; of one on the Thatanophidia of India; of a work on Clinical and Pathological Observations in India; of another on Tropical Diseases; of one on Indian Fevers; and of many papers and monographs in the journals of Europe and India. The Royal Family of Great Britain and his contemporaries bestowed on him many professional honours. He was Honorary Physician to the Queen, and to H.R.H. the Prince of Wales, and to H.R.H. the Duke of Edinburgh. He was President of the Asiatic Society of Bengal; Member of the Senate of the Army Medical Schools, Netley; President of the Medical Board at the India Office; President of the Medical Society of London; President of the Epidemiological Society, London; a Governor of Guy's Hospital; Consulting Physician of Charing Cross Hospital; Fellow of the Royal Geographical Society of London. 

FAZL ULLAH RASHID, styled Rashid-ul-Din, author of Jamil ut Taurikh. See Rashid-ul-Din.

FEASTS.

Ziafat, Arab, Pers., Banchetto . . . . 1r.
Festin, . . . . . BANQUETE, . . . . . Sr.
Fest, . . . . . GER.

Feasts are often mentioned in the Old and New Testaments, and the texts find many illustrations in India. Genesis xlv. 22 says, 'To all of them he gave changes of raiment'; and at the close of a feast, Hindus, among other presents to the guests, commonly give new garments. A Hindu garment is merely a piece of cloth, requiring no work of the tailor. Deuteronomy xxiii. 10 says, 'He shall not come within the camp;' and Hindus in a state of uncleanness are interdicted from feasts, etc. Mark xiv. 20 says, 'Is it one of the twelve that dipped with me in the dish.' In the East, Hindus never eat together from one dish, except where a strong attachment subsists between two or more persons of the same caste. In such a case, one person sometimes invites another to come and sit by him, and eat
FEATHERS.

from the same dish. It is highly probable that the same custom existed among the Jews, and that the sacred historian mentions this notice of our Lord's, 'It is one of the twelve that dipped with me in the dish,' to mark more strongly the perjury of the character of Judas. John ii. 8 says, 'Bear unto the governor of the feast.' It is customary, both with the Hindus and the Mahomedans, to appoint a person who is expert in conducting the ceremonies of a feast, to manage as governor of the feast. This person is rarely the master of the house. The numbers invited amount occasionally to hundreds, sometimes thousands, and a person to secure regularity is indispensable. In Asia the term is applied by Europeans to all the religious festival rites of the natives, as to the Ramzan and Maharram, etc., of the Mahomedans, to the Diwali and Dassarah, etc., of the Hindus, to the festivals of the Chinese, Burmese, Japanese, etc.--\textit{Word's Hindostanoo,} 1914.

\textbf{FEATHERS.}

In Asia, feathers are never used for stuffing beds or pillows, but, as in Europe, they are largely used for personal ornament, those of the ostrich, the Indian roller, the green kingfisher, and the egret being most frequently employed. Those of the ostrich are imported from Africa, and the west of Europe is chiefly supplied from the northern margin of the Great Desert of Arabia. Those plucked from the living animal, or recently killed birds, are more beautiful and more durable than if taken from the animal some time after death, or than cast or dropped feathers. The plumage of the male bird is very superior to that of the female, the fine drooping plumes on the back and near the tail being of the purest white, while those of the female are never free from a tinge of grey near the tip. Commercelly, in Bengal, is celebrated for its egrets' feathers for broad-covers, tippets, boas, and muffas, and some of them are exceedingly beautiful, and not inferior in quality to those imported into Great Britain from Africa. The down of the young adjutant bird also is made into ladies' boas and victorines. The under tail coverts are collected and sold in considerable quantity. Many are procured at Trichoor in Malabar. In the Panjab the narrow black wing feathers of the onkar are used to make the kalgi, or plumes for the khod or helmet. These plumes have a very elegant appearance; they stand about 6 or 8 inches above the helmet. The feathers of the bustard are similarly used. In Madras, dealers in birds' feathers carry on their trade on an extensive scale. One dealer had nearly 100 sets of bustards, each composed of 4 or 5 shikaris and 1 cock; near some of these people are Korawa (basket-makers) who live in and about Madras. Each set has its headman, who is responsible for others. These sets are sent out once a year, each receiving from 20 to 100 rupees, together with a certain number of neta, a knife, etc. They traverse all India, collecting the feathers of kingfishers, and return after six or eight months to Madras, each set bringing from 1000 to 6000 feathers, which are taken by the dealer at Rs. 14 per 100, and shipped to Burma, Penang, Singapore, and Malacca, bringing 10 to 13 dollars the 100. Feathers form a considerable export from India. In the four years 1857-8 to 1860-1, to the value of £27,570 were exported, about one-third of which went to Britain, France, and China. Wings of a kingfisher are imported into Burma from India through Arakan. In 1875-80 the feathers exported from India were:

\begin{center}

1877-78 & 55,000 & 2,10,350 & 1879-80 & 41,270 & 1,20,816 \\
1878-79 & 3,51,177 & 1,93,300 & & & \\
\hline
\end{tabular}
\end{center}

The blue feathers of the jay, the kingfisher, and other blue-feathered birds, are largely used in China for ornamentation, passed on silver gilt. The long scapular feathers of the Indian snipe-bird, Plotosus melanogaster, Gmelin, is looked on by the Khassya race as a badge of royalty.—M. E. J. R.; \textit{Dr. Taylor in Ex.}, 1851.

\textbf{FEE-SHOO.} \textit{Chin.} A yew tree of the genus Cephalotaxus. Its seeds are to be found in a dry state in all the doctors' shops in Chinese towns. They are considered valuable in cases of cough, asthma, and other affections of the respiratory organs—\textit{Carpenter,} 1888.

\textbf{FEET-WASHING,} alike amongst Hindus and Mahomedans, is a purification strictly attended to before meals. It has always been an oriental custom. With Hindus, so soon as a guest enters, to present him with water to wash his feet is one of the first civilities.

\textbf{FEL.} \textit{Pers.} Elephant. Hence Fel-khana, elephant shed; Fel-pai, elephantiasis. It is from this word 'Fel,' with the Arabic 'al,' that the words Elephas and Elephant seem to come.

\textbf{FELAMORZ,} the son of Rustum, the hero of Persian romance, was defeated by Behram near the fort of Fessa, between Shiraz and Darab. Behram caused Felamorz to be hanged, and his tomb existed in the village, until, it is said, a European traveller took it away as a relic.

\textbf{FELIS,} a genus of the mammalia, of the cat kind, of the natural order Carnivora, the family Felidae, and sub-family Felinae. Amongst naturalists, the notices of these are usually limited to the larger wild animals of this genus. The lion, the pard, the cheeta, the chaus, the wild cat, and the caracal or lynx, are common to India and Africa. The tiger, the pard, the clouded leopard, the marbled tiger cat, the large tiger cat, the leopard cat, and the bay cat are common to India, Assam, Burma, and Malaya. The ounce is of Central Asia; and the small tiger cat (F. Jerdoni), the Rusty spotted cat, and the spotted wild cat, are confined to the Peninsula of India.

Several of the smaller species of Felis have a very close family resemblance, and zoological writers have not agreed in their specific distinctions. Similarly, amongst sportsmen in India, there is a continuous attempt to distinguish the various kinds of the cheeta. This word is of Hindi or Mahrati origin, and means spotted; and amongst the spotted feline animals, sportmen speak of the leopard, the cheeta, the blue cheeta, the cheeta in a hunting or maned cheeta; and cheeta is generally applied as a suffix to all of these. There would seem to be at least four varieties of spotted cats, besides such rare animals as the snow leopard of the Himalaya, and the black panther.

The two larger animals, which are confusingly called cheeta, panther, leopard, differ so much in marking and appearance, as to make them,
alike to the scientific and to the unscientific eye, appear distinct species. The lighter coloured of the two has the ground of a light tawny yellow, shaded into white at the belly, and inside of the legs, neck, and chest.

Besides these, there is a small spotted cat also called cheeta, which preys on dogs and small animals, but is quite unequal to cope with a bullock. The rings are closer and smaller than those on the larger panther.

The hunting or maned leopard (Felis jubata, Leopards jubata), the fourth on the list, is quite distinct, and it has a mane. Its claws are only partially retractile. Many of the native princes train them to hunt antelopes.

Felis leo, the Lion.

Striped tiger,  |  Eng.  |  Pute wash,  |  MAHR.  
Bagh,       |  HIND.  |  Rimass, Harinam, SUMAT.  
Machan,     |  JAVAN.  |  Pilli,  |  TAM.  

The royal tiger is found throughout India to the S.E. boundary of China, through the Malay Peninsula, in Java and Sumatra. They are numerous in the centre of the Peninsula of India, and very numerous in Singapore. Full-grown specimens vary considerably in size, colour, and markings, but are considered to be of one species. They feed on cattle, on the sambar or Rusa hippocaphus, and more rarely on the Axis maculata or spotted deer, but only when suffering from extreme hunger. Fros, hogs, porcupines, and other creatures are eaten by them. The tiger is not brave, retires before opposition, unless wounded. The buffaloes in herds charge at a tiger and beat it off. The wild dogs hunt down and will drive a tiger away, but have not the power to destroy one; and one was found evidently killed by a boar's tusk. On one occasion, a herd boy being carried off, the buffaloes charged the tiger, and made it drop the lad.

Felis pardinus, LINN., the Pard.

F. leopardus, Schreb.  |  Leopardus varius, Gray.  
Var. a. the Panther.

F. leopardus, Temm.  |  F. pardinus, Hodg.

Burkal,  |  GON.  |  China pull,  |  Tel.  
Tendu, Chita,  |  HIND.  |  Silk,  |  Thib.  
Chita bag,  |  Leopard of Sykes.

This variety of the larger cheeta is generally found in Western Asia, Bengal, Africa, and Afghanistan. It is of a pale fulvous yellow, with white belly, and a shorter and closer fur than the smaller variety; it dwells in more open country than the smaller variety, and is a slighter and more active animal, extremely strong and fierce, and instances occur of several men being killed before this cheeta can be destroyed. They destroy wild pigs, monkeys, occasionally domestic cattle, ponies, children, old women.

Felis.

Var. b. the Leopard.

Bor-bancha,  |  Lakkar bagha,  |  

This is smaller and shorter, fur longer and looser, and spots more crowded. It varies much in size, some not bigger than a large tiger cat. It is very fearless, taking sheep, goats, monkeys, peafowl, etc., prowling around villages, and seeing dogs even in tents and houses. It is more abundant in the forest tracts of Malabar, the Wynad, Gumsur, and the Himalayas.

Var. c. Felis melas, PERRON, F. peregrin, Hodg.

This is a well-marked race of a uniform dull black colour, the spots showing in particular lights, always found in forests or forest country, sparingly throughout all India, Assam, Malay Peninsula. This is supposed by some to be a black variety of the Felis pardinus, and both varieties are said to have been found in the same den.

Felis jubata, the hunting cheeta or hunting leopard, is common, though not plentiful, throughout Southern India. They can be quite tame, and handled with freedom. It is the pard of the ancients.

Felis cristata, a fossil tiger thus named was discovered by Sir P. T. Cautley in the Siwalik Hills.

Felis catus, the Cat, Domestic Cat.

Si mi,  |  BHOT.  |  Sokpa.  |  MAILA.  
Pilli,  |  HIND.  |  Pon,  |  TAM.  
Minkiyeng,  |  KAM.  |  Pilli,  |  Tel.  

The general term cat is applied by naturalists to all the feline tribe, but a considerable variety of animals are called cats in all countries, Civet cats, Genet cats, Marten cats, Pole cats, etc.; the Lemur also is the Madagascar cat. The marsupial animals of Australia are known as wild cats; the Shimmel billi of the people of India means the bush cat; and the wild cats of India are a small but savage kind of lynx (Felis rufa). Domesticated cats are not alluded to in Scripture, but they are mentioned in a Sanskrit writing 2000 years old, and there are figures of them on the monuments of Egypt of a much prior age. Mummy cats have been identified with Felis chaus or marsh cats, and with F. caliginata and F. boubastes, both still found in Egypt wild and domesticated. Pallas, Tammunic, and Blyth believe that the domestic cats are descendants of several wild species, which needlessly intermingle. F. sylvestris is wild in Scotland. F. lybica is the wild cat of Algeria; and in S. Africa F. Cafrua is wild. In India are found wild species, of which F. chaus has a lynx-like tail: F. ornata or tigrina occurs at Hansi, and F. manal occurs in Central Asia.

In the Isle of Man cats are tailless, and have long hind legs. The domestic creole cat of Antigua is small, with an elongated head; and that of Paraguay, also small, has a lanky body. In the Malay Archipelago, Siam, Pegu, Burma, all the domesticated cats have truncated tails, with a joint at the end. In China a breed has drooping ears. The large Angora or Persian cat is supposed to be the descendant of the Felis manal of Middle Asia; it breeds freely with Indian cats.

Whittington's nursery tale of England is
FELIS.

FELIS planiceps, Vigors, of the Malay Peninsula.

2d. The Lynxie Group.

F. ornata, Gray. F. servalina, Jardine.

F. hurtus, Bligh.

The ground colour is cat-grey, with numerous small black roundish spots. Length 2 feet, tail 1 foot. Central India, common at Hisar; feeds on the jarbon rat.

F. chaus, Gulden, Common Jungle Cat.

F. affinis, Gray. F. kutas, Pearson.

F. erythrostes, Hods.

Ban-beral, BENG. Mang bek. CAN. Bhago.

Katas, canthi billi, HIND. Jinka pilli, TEL. Cherra pulli, MALEAL. Kada bek, Billa bek, WAD.

Common all over India, and up to 8000 feet, and throughout Africa; breeds with domestic cat.

F. caracal, Schr., the Red Lynx. Caracal melanotis, Grey, is found throughout Africa, in Arabia, Persia, Tibet, in many parts of Central and Western India, not in the Himalaya or Bengal.

Feeds on peafowl, hares, etc., and is trained to kill hares, pheasants, kites, crows, cranes.

F. issabellina, Bligh, is the Lynx of Tibet, and F. manul, Palas (F. nigriticeps, Hods.), is also of Tibet. F. megalotis, Temm., is of Timor.

F. jubata, Schreb., the Huntig Leopard.

F. guttata, Herrmann. F. venata, F. Smith.

Kendus bagh, BENG. Chin, Yuz, Laggar, HIND. Chircha, Sivunga, CAM. Chita pull, TEL.

This was the pard, panther, and leopards of the ancients. Length, head and body about 4½ feet, tail 2½ feet, height 2½ to 2¾ feet. It is found throughout Africa, in S.W. Asia, Syria, Mesopotamia, in Sind, Rajputana, Kandesh, Central and Southern India. It attacks antelope, gazelle, and nilgai. It is trained to hunt deer, and is carried hooded on a cart till near the herd, where it is unhooded and slipped. It then slips down, and, if near the antelope, springs forward with a velocity perhaps exceeding that any other quadruped possessed. It singles out the biggest buck of the herd, holds it by the throat till disabled. If it fail, it walks about angrily.—Jardine, Mammals; Elliott; Bligh.

FELL, CAPTAIN, I.N., surveyed the Coromandel coast and the northern parts of the coast of the Tenasserim Provinces.

FELLAH, Falleh, in Egypt, a cultivator, a farmer; but applied to an Egyptian is deemed derogative.

FELLEK. Pers. A stout pole of or 8 feet long, with two rope nooses in the centre, used for the bastimado (zarab). The sufferer is laid on the back, his feet are inserted in the nooses, and retained immovable in the air by a man at each end of the pole; and two men, armed with pliable sticks, called chob, beat the soles of the culprit's feet. The Persians call it Chob khurdan, to eat stick.

FELSPAR, a mineral entering largely into the composition of hypogene rocks; granite is composed of felspar, quartz, and mica. It forms nearly two-thirds of granite rocks; it contains potass, an alkaline substance with a strong attraction for moisture or water. After a shower or a heavy night's dew, the moisture is taken up by the felspar, and conveyed into the substance of the rock, a portion of the potass being dissolved.
FERLING.

FERALIA of the Romans is the Srudhi of the Hindus.—W.

FERGUSSON, JAMES, Architect, C.E., D.C.I., I.L.D., F.R.S., F.R.G.S. and M.R.A.S., was born at Ayr, in Scotland, in 1808, and was for a short time a partner in a mercantile firm in Calcutta. During the years 1835–1842 he travelled through India, investigating the history, forms, and architectural antiquities, examined the eastern caves at Bactroo and Mahaballpur, and those of Ajanta, Ellora, Karli, Kenheri, Elephant, and others; and he has published the result of his researches into the origin of the architectural and sculptured remains of India, in volumes of the highest value to the ancient history of that country:—Illustrations of the Rock-cut Temples of India, 1845; Picturesque Illustrations of Ancient Architecture in Hindustan, 1847; Essay on the Ancient Topography of Jerusalem, 1847; Historical Inquiry into the True Principles of Art; Handbook of Architecture, 1855; On a Proposed New System of Fortification, 1849; Palaces of Nineveh and Persepolis Restored, 1851; History of the Modern Styles of Architecture, 1860, 1874; History of Ancient and Indian Architecture, 3 vols., 1865, 1874, 1876; Tree and Serpent Worship, 1868 and 1873; Illustrated Handbook for India, 1853, 1859; rude Stone Monuments, 1872; Holy Sepulchre, 1865, 1871; Study of Indian Architecture, 1870; Temples of the 18th Century, 1875; Cave Temples of India, jointly with Mr. Burgess, 1880. In 1859 he was appointed one of the Royal Commissioners to inquire into the defences of Great Britain, 7th April 1871, the Royal Institute of British Architects presented him with the Royal Gold Medal, as the author who had distinguished himself by his architectural researches.

FERHAD, so conspicuous in Persian romance, contemporary with Khusru Parvez, or Choeores (at the close of the 6th century), and that monarch's rival in the affections of fair Shirin, was a native of Kurdistan. He may be almost always recognised by the tishah or pickaxe, with which, for the sake of his mistress, he fractured or excavated enormous rocks, and, according to tradition, reduced the rugged face of Mount Resitin into those extraordinary sculptures for which it is still remarkable. With his tishah, says the poet Nizami, he rendered the hardest stone, as it were, soft like wax.—Ouseley's Travels, i. p. 234.

FERIDUN, n.c. 700? a hero of Persia, whose legend is related by Firdusi in the Shahnama. Feridun is fabled to have been the son of Abtin and Firinek, and to have been born in the reign of Zohak. Zohak, being warned by wise men that Feridun would overthrow his kingdom, sought to destroy the child. Feridun's father was killed, but the mother fled with the child, who was there brought up by a hermit. When sixteen years of age, Feridun learned from his mother the secret of his birth, and determined on revenge. He overthrew the king, and nailed him on the cross. Feridun, in this Iranian legend, is identical with Thracian, and the Tria of the Veda. He is fabled to have killed the tyrant Zohak on the Demavend mountain of the Alborz, south of the Caspian, as the Trita slew the demon Vrita.—Buness, p. 348.

FERTINGI, HIND., PERS. A term employed by Mahomedans of India to designate Europeans. It is used derogatorily, but ought not to be so, 1085
FEROSHPUR.

rhizomes of translated by Mahomedan was in the of Briggs 8vo, Earliest founded, 1612, 1780, 1794 was by J. Powers... of Iran. Ferozabad, on the summit of the mountain, and the fortified places of Darzi, Kutch, and Chakars, are considered similar to the whole nests of the Bakhtiar and Luri in the environs of Isfahan. They have a resemblance to the Hazara, but their foreheads, chin, complexion, and figure are less Turanian. They are decidedly Iranian. They take their name, the Feroz Koh, after the city of that name, about 63 miles from Teheran. Timur settled them by force in Mazenderan, but they soon returned to their own country. They have a few cattle, and they sow a little, and plunder the caravans travelling on the Maimani road, or make inroads on the scattered tents of the Jamshidi. —Vamberg.

FEROZPUR, in lat. 30° 57′ 1″ N., long. 74° 38′ 4″ E., in the Punjab, on the left bank of the Satlej. The mean height of the station is 1120 feet.

FERN, Kieuh, Chin. Species of Nephrumcidium and Pteris are common in China, and are included under this name. A kind of arrowroot is prepared from the rhizomes, which are also eaten, after proper washing and cooking.

Fern Spores, Hsiu-ku-chia, Chin. This fern plant grows in Hiu-nan Sze-chuen, and Che-kiang, in China, where the spores mean golden sea-sand. It is an exceedingly light, fine, reddish-brown powder, which burns almost as readily as lycopodium.—Smith.

FEROHZAD BAKHTYAR, the 29th and last but one of the Sassanian kings, A.D. 631. Under his successor, Yezdegird, the kingdom fell to the Mahomedans, A.D. 652.

FERONIA ELEPHANTUM. Roxb. 

Pteris vittata, E.J.R.; Bhuin-koit, Kaulfussia, Velanga; Vela, Vila, Vella, Kon.

A large, tall, wood-apple tree, one of the Aurantiaceae or orange tribe, is widely diffused in India. Its wood is white, hard, and durable. A specimen which was tried bore 560 lbs. in Vizagapatam it is much used in house-building, but said not to be very durable. It could possibly be creosoted, so as to withstand exposure. Its spheroidal fruit when ripe contains a dark brown, agreeable subacid pulp. When an incision is made in the trunk, a transparent oily fluid exudes, which by many artists for mixing their colours. Both leaves and flowers have a strong odour of anise, and the young leaves are given in the bowels complaints of children as a stomachic stimulant. It yields a large quantity of a clear white gum, much resembling gum-arabic in its sensible properties, and forms the well-known East India gum-arabic; and, from its ready solubility without residue, it gives the best mucilage for making black ink. The rather acid pulp contained within the hard shell of the fruit is eaten with sugar, but is not much prized.—Ainslie; Rozh.; Roble; M. E. J. R.; Gibson's Report; O'Sha; Wight.

FEROZ. Pers. Victory. Hence Ferozabad, Ferozpur, Ferozhshah, as names of towns; Feroz and Ferozshah, names of persons and kings.

FEROZ KOH, a tribe of the Almuk, a small number of people, about 6000, dwelling on the steep hill N.E. of Kale No, and from their inaccessible position afford their whole neighbourhood with their robbing and plundering. Kale No, on the summit of the mountain, and the fortified places of Darzi, Kutch, and Chakars, are considered similar to the whole nests of the Bakhtiar and Luri in the environs of Isfahan. They have a resemblance to the Hazara, but their foreheads, chin, complexion, and figure are less Turanian. They are decidedly Iranian. They take their name, the Feroz Koh, after the city of that name, about 63 miles from Teheran. Timur settled them by force in Mazenderan, but they soon returned to their own country. They have a few cattle, and they sow a little, and plunder the caravans travelling on the Maimani road, or make inroads on the scattered tents of the Jamshidi. —Vamberg.

FEROZPUR, in lat. 30° 57′ 1″ N., long. 74° 38′ 4″ E., in the Punjab, on the left bank of the Satlaj. The mean height of the station is 1120 feet.

1086

being derived from Fering, Europe, as Dana-i-Fering wa Dowlat-i-Hind, the wisdom of Europe and pomp of India. Peling is the Tibetan corruption of the word Firingi, itself a corruption of Frank, the oriental word for European.

FERISHTA, the literary title of Muhammad Kasim, styled Hindu Shah, also Ferishta, author of the Tarikh-i-Ferishta, a work considered superior to all the other general histories of India. He was born at Astarabad, on the shores of the Caspian, A.D. 1570, according to General Briggs, but according to M. Jules Mohl, A.D. 1560. His father, Ghalam Ali Hindu Shah, left his native country and came to Ahmadnagarr while Ferishta was a lad, thence ruled over by the Nizam Shah. Briggs supposes his death to have occurred A.D. 1612, when only 41 years of age. He seems to have accompanied Chah Sultan to Bijapur, where he lived under the Adal Shahi kings, and wrote the book on which several have been founded, viz. The History of Hindustan from the Earliest Times to the Death of Akbar, which was translated by A. Dow, 3 vols. 4to, London 1768; also The History of Dekhan from the First Mahomedan Conquests, and the History of Bengal to 1780, which was translated from the Persian by Dr. J. Scott in 1794; The History of the Rise of the Mahomedan Powers in India till A.D. 1612, translated from the Persian by Jo. Briggs, 4 vols. 8vo, London 1829. He also wrote many novels. His death is also supposed to have occurred in a period of famine while still only forty years of age. His work was translated by General Briggs of the Madras army, but the manuscript was burned when the Poona Residency was destroyed by Baji Rao, and had again to be re-translated by General Briggs.

FERNS, the Foug' reé of the French and Fielle of the Italians. Flowerless plants, the Filicales of Lindley and Fillices of other authors, belonging to the Acrogene. The species present infinite variety, in the form and division of their elegant leaves or fronds, the arrangement of the veins, and the form and general character of the clusters (sori) of minute fruit capsules, which are disposed upon the under surface or margin of the fronds. The rhizomes of the common brake (Pteris aquilina, L.) furnish a farinaceous food in times of scarcity. The male shield-fern, etc., are employed in medicine as anthelmintics, but Europeans in India largely cultivate exotic species as plants. In the table-lands they are met with, and in the hills and mountains of India they are abundant. The Dipteris Horsfieldi of John is the noblest of all ferns. Captain Beddome in 1853 issued a volume on the Ferns of Southern India, containing 84 genera. Species of the following occur in India:

**Polypodiaceae.**

1. autophyllum. 2. hemionitis. 3. notholena. 4. aspidium. 5. acraepodium. 6. bennetii. 7. Lindsea. 8. adiantum. 9. licoria. 10. fimbriata. 11. davallia. 12. acrostichum.

1. trichomanes. 2. Osmondeaceae. 3. tetradium. 4. allantodia. 5. chelitsiana. 6. vittaria. 7. blechnum. 8. Gleicheniaceae. 9. ceratopteris. 10. gleichenia. 11. lycopodium. 12. helemos-tachys.

Fern Root, Kieu, Chin. Species of Nephrumcidium and Pteris are common in China, and are included under this name. A kind of arrowroot is prepared from the rhizomes, which are also eaten, after proper washing and cooking.

Fern Spores, Hsiu-ku-chia, Chin. This fern plant grows in Hiu-nan Sze-chuen, and Che-kiang, in China, where the spores mean golden sea-sand. It is an exceedingly light, fine, reddish-brown powder, which burns almost as readily as lycopodium.—Smith.
FEROZ SHAH.

FEROZ SHAH, in the neighbourhood of Ferozpur, in the Panjab. A battle was fought here on the 21st and 22nd December 1845, between the British and the Sikhs.

FEROZ TAGHALAQ SHAH, king of Dehli, was grandfather of Sultan Mahmul, whom Timur conquered. It was this king (A.D. 1351-1388, A.H. 752-790) who removed the lat or pillar, according to one account, from near Khirazbad, immediately west of the Jumna, at the foot of the Siwalik Hills, to Dehli, and erected it in the centre of his palace. This column is alluded to by Chandra Gullab, telling the fame of the Chahara, but he says it was placed at Nigabode, a place of pilgrimage on the Jumna, a few miles below Dehli, whence it must have been removed to its present singular position. The name of Beasildake (Visaladeva) heads the inscription on the pillar. The pillar is now known as one of the Dehli Lat, also the Golden Lat, so called from the gilt kalasa, pinnacle or ball, which Feroz Shah placed on its summit. This monolith, like the kindred pillar at Allahabad, was in the first instance exclusively devoted to the exhibition of a counterpart text of the edicts of Asoka, but succeeding generations have taken advantage of the ready prepared monument to supplement a record of their own prowess. The other stone pillar at Dehli was brought from Mirat. His long reign was distinguished by the erection of many mosques, sarai, colleges, hospitals, public baths, wells, aqueducts, and reservoirs for irrigation. He excavated a fine canal, running from the river Jumna through the province of Dehli to the Kagar river, which subsequently formed a lake. About 200 miles of it were restored by the British in the middle of the 19th century. The public works executed in his reign were 50 dams across rivers, and 50 reservoirs to promote irrigation, 40 mosques, 30 colleges, 100 caravansaries, 100 hospitals, 100 public baths, 150 bridges, besides many other buildings.—\textit{Toody's Rajastahan, ii. p. 452; Orme. See Lat.}

FERUQUEH, amongst the Afghans, means a tribe. It is probably from the Arabic Fargh, separation. Fargah, a tribe or community.

FERREOLA BUXIFOLIA. \textit{Roxb.} iii. p. 790. \textit{Maba buxifolia, Pers.}

Illumbili maram, .. \textit{Tam.} | Eroombala maram, \textit{Tam.}

This plant grows among the Cirec mountains to the size of a small tree, but in the low countries it is only a shrub. The wood is dark-coloured, remarkably hard and durable; when its size will admit, it is employed for such uses as require the most durable, heavy wood. Its small red fruit, containing one seed when ripe, is pleasant to the taste, and is well known over India.—\textit{Roxb.; Ainslie; Mr. Rohde's MSS.; Voigt.}

FERRY. The ferries at rivers in the S. of Asia are crossed by means very various. On the Tigris, Euphrates, the Upper Indus and its affluents, the practice of 3000 years still continues, for Xenophon’s ten thousand were ferried over on inflated skins, and three slabs in the British Museum show the representation of the king of Assyria crossing the Euphrates in this mode, which, on the rivers named, still continues. Canoes are of common use on the ferries; two pieces of the bole of a palmyra tree, scooped out and blocked with clay at the end, and fastened together, are used in the Circars, but the wicker and leather coracle traverses most of the rivers in the Peninsula of India. The ferry-men on the Kistna river in the Peninsula are the Koli race, stalwart men. The Kili-Katir or Madaklapur race are also Kahl-gira or ferrymen.

FERULA ASAFETIDICA. \textit{Linn.} \textit{Asafoetida.}

\textit{Narthex asafoetida, Falce.}

Hillit, Anjadian, .. \textit{Arab.} | Hingisch, .. \textit{Hind.}

Samagh-ul-mahrus, .. \textit{Yang.} | Kasim.

Jawfela, .. \textit{Ingiva.} | Hing-patri, Tel.

Anza, Hing, .. \textit{Hind.}

This plant grows in all the mountainous countries in the north, the south, and the cast of Persia, between Persia and Tibet, and in Lar, Khorsan, Afghanistan, up to India. It grows in the neighbour-hood of Herat, mountains of Daristan and Baluchistan, and on the Hindu Kush at 7000 feet. Dr. Cleghorn says the asafoetida plant occurs in Pangi, and in the localities given for daphne and desmodium (as yielding material for making paper in district jails). Dr. Stewart got this plant in Khagan (Jhelum basin) at about 6000 feet; and Dr. Cleghorn, he says, mentions specimens of it as being brought to him on the Upper Chenab at over 8000 feet, but is not known there. This plant has been conjectured to have produced the Lasser of the ancients (see Astrantia), which, however, is now ascribed to a Thapsian. The gum-resin asafoetida is obtained by slicing the roots. A milky juice exudes, which dries rapidly into a fetid, pasty, bitter, and pungent mass. The odor of asafoetida has gained for the gum-resin the epithet of the devil’s dung; the taste is bitter, acrid, and very durable. Asafoetida occurs in commerce in shapeless masses of waxy consistence, with small transparent, brittle, and white tears. It is used in medicine, and by all classes of Hindus as a condiment with their food.—\textit{Stewart; Cleghorn, Punj. Rep.; Powell.}

FERULA GALBANIFERA. \textit{Nees and Eberm.}

Coastal of the Mediterranean, the Caucasus, etc.; yields copiously a secretion which dries into a gum-resin, supposed by some to be a galbanum. Professor Don states that galbanum is yielded by quite a different genus, called by him Galbanum officinale.—\textit{Eng. Cyc.; Hogg, p. 388; Von Mueller.}

FERULA ORIENTALIS. — \textit{?} \textit{O’Sh.}

P. ammonifera, \textit{Fec.} | \textit{Feeshook, .. \textit{Arab.}}

It grows in Asia Minor, Greece, and Morocco; supposed a source of gum ammoniacum.—\textit{O’Sh.} 364.

FERULA PERSICA. \textit{K. F. Sagapenm, \textit{Fec.}}

Suganij, .. \textit{Arab.} | \textit{Sagapen, \textit{Gn. Pers.}}

Bakmu .. \textit{Bomnat.} | \textit{Bakmu.}

Kandil .. \textit{Hind.}

A native of Persia; stem about two feet high. According to some authorities, it produces sagapenum. Nees von Esenbeck and Lindley considered it as one of many plants from which asafoetida is procured. Sagapenum is found in masses. Its odour resembles that of garlic and asafoetida; its taste is hot, nauseous, and rather bitter. It is sometimes adulterated with bellidium, gunda-birosa, and other similar gum-resins or turpentine. It is collected in the same manner as asafoetida; sells at 4 rupees the pound. The medical uses of sagapenum are the same as those of asafoetida, but it is considered less energetic, and is but little employed.—\textit{O’Sh.} p. 363.

FESTIVALS. The Festivals of the Hindus, of the Mahomedans, Burmese, and of the Chinese, are connected with their religions. At the Hindu Amarnath festival of the new moon, Hindus eat only one meal. It was a monthly mortuary service, at which prayers are offered up for their parents, grand
and great-grand-parents. In the new moons of January, July, and August, they make offerings to the manes, of sweet food. The Thivasam is an annual veneration of their parent, grand or great-grand-parent. The Mahalya Putham of the month of August is a mortuary service. Avani Aattam is a half-yearly service. With Mahomedans, the new year festival of the Maharram, and those of the Runzam and Bakreel are their chief. The Chinese new year falls on the 15th of Aquarius, their feast of lanterns on the first full moon of the new year.

**FETISHISM** is the belief that external phenomena can be controlled by witchcraft; the stage of religion in which man supposes he can force the Deity to comply with his desires. Totemism is the worship of natural objects.

**FEUDATORY.**

The Akukote chief is a Mahratta Subia of the Bhonsla family, to which belong also the Kolhapur chiefs. He is addressed as Rao Sahib Mirhaban.

Aroc.—In the earlier and middle parts of the 18th century, when Mahomedan generals, the British, and the French, were striving for supremacy in the Karnatic, the rulers for the time were styled Nawabs of Aroc. This was the title of a family whom the British favoured, and whom the treaty of Paris of 1751 acknowledged, though they style themselves Jalwah, of high dignity. The last Nawab died in 1855, but his uncle, Prince Azim Jah Bahadur, was since then created Prince of Aroc, and this title descended to that prince's son, who was styled Umdat-ul-Umra, Amir-ul-Umra, Madar-ul-Mulk, Azim-u-Dowlah, Asad-u-Dowlah-ul-Angiz (Zahir-u-Dowlah), Khan Bahadur, Zu-ul-Fiqar Jung, Fitrat Jung, Sipah Salar, Amir-i-Arkat and (?) Hinds, G.C.S.I.

The Banaganapilly ruler is a Mahomedan Synd, and is styled Nawab of Banaganapilly, Khan Bahadur.

The Bengal Subahdahr is not ruling. In 1763, Jafar Ali Khan was placed by Clive on the musuln as Subahdahr of Bengal, Behar, and Orissa; and in 1880 the holder of the titular dignity was the eighth in succession, and styled Nawab Mantazam-ul-Mulk, Mohsan-u-Dowlah, Faridun Jah (name), Khan Bahadur, Naesar Jung.

In Bengal there are many great Hindu landed proprietors, as the Raja of Benares, the Raja of Bardwan; and numerous chieftains with territorial possessions, as in Muripur, and amongst the Garo and Khasya, and in Assam on the east, and in the west amongst the Santal, Kol, etc.

In Calcutta, the capital of Bengal, there are many families with titular appellations, some of them patronymic, some of Mahomedan and some of Hindu origin, such as Deb; Sri-sri-Raja Deb-Bhoo Ballanda; Kumar; Rai, Raja, Rani, Maharaja, Maharani, Rai Bahadur, Bahadur, Raja Bahadur, Maharaja Bahadur; Malik, Nawab. A Hindu lady, a great patron of learning, has recently been created a Maharani.

The Bhaduris family of the Agra district often rendered good service to the British; and Lord Lake bestowed on them the pargana of Atais as an allamgah jaghir, but it was subsequently resumed.

Bhownagar rulers are styled Thakur, and have the title of Rawal.

Bhopal is ruled by a lady of the Mahomedan faith, Shah Jahan Begum, G.C.S.I., Begum of Bhopal. The titular designations of the Bhopal chiefs are, Myan, Rao, Rawut, Raja, Maharaja, Bahadur, Nawab, and Thakur.

Bhurtpur, in Hindustan, has a Hindu family of the Jat race, the ancient Geete. Their title is Brijandar Siwai Bahadur, Bahadur Jung, Maharaja Bahadur of Bhurtpur. The Jat are an earnest, brave race.

Bikanir, in Rajputana, is ruled over by a Rahtor Rajput, styled Maharaja of Bikanir.

Bobali, a great landed estate in the Northern Circars, is held by a Hindu, styled Raja Sahib Mirhan Dostan, Raja (name) Bobali Rana Gaur.

The Bundi ruler is styled Maharao Raja of Bundi. In the Canarese-speaking country, the chiefs are largely of Mahratta origin. Jamnepa Kara means a public benefactor.

Chichli has a Hindu ruler, styled Raja Bahadur;
his seal bears the titles Sado-sahai, Nar Singh, Nizam Singh, Sut-Bijai Bahadur Singh, son of Nizam Singh. His insignia is a yellow or jetambar flag, and chowri and staff.

The Cochini sovereign is a Hindu, whose insignia is a palanquin, with umbrella, lamp, and chank shell, entitled His Highness Rama Varma, Raja of Cochin, K.C.S.I.

Holkar, a sovereign ruling at Indore, in Malwa, is of the Dhhangar or shepherd tribe. He is styled Maharaj, Dhiraj, Rajeshur, Siwai, Tukoji Rao Holkar Bahbadur, K.G.C.S.I. Since 1836, each succeeding ruler has been adopted according to Hindu rites. Joswunt Rao died 1811, and was succeeded by his son Mulhar Rao, who died in 1833, childless. Martand Rao was adopted as his successor, but he was deposed by Hari Rao, who died in 1843, also childless; and his adopted son and successor, Khande Rao, died in 1844, and was succeeded by adoption by Tukoji Rao (ruler, 1881).

Hyderabad, in the Dekhan, has been for nearly 200 years under a Mahomedan family, now styled the Asaf Jahi. The state is in the centre of the Peninsula, and is formed out of parts of the Gond, Telung, Cooarase, and Maharrata countries. The sovereign is generally known as the Nizam, but is styled Muzzaffer-ul-Mumalik, Rustum-u-Dauran, Arastah-i-Zaman, Asaf Jah, Nizam-ul-Mulk, Nizam-u-Dowlah, Mahbub Ali Khan Bahaudur, Fatah Jung.

The Jeypore Maharaja is a Kachwaha Rajput. The Jhala ruler at Drangada in Kattyavard is also a Rajput family.

Jodhpur, under a Maharaja, a Raultor Rajput.

Kalahari or Kala hadari is a zamindari estate near Madras, held under a perpetual (cowl) agreement (Sanad-i-Milkat Istimtar). The proprietor is styled Raja Damara Kumara (name), Naidu Bahadur Varu. One of them died March 1881.

Kapurthalla, a family known as the Ahluwala, from the village of Ahlu, near Lahore. It is a Sikh chieftaincy of 800 square miles in the Panjab, and of 850 square miles in Oudh. Revenue, 17 lakhs.

Kashmir and Jammu are ruled by a family of Jamwal Rajputs, by treaties of 6th March 1844 and 1st January 1877, styled Maharaja Indar Mahindar Bahadur, Sah-sip-Sultanat, Musbhir-i-Kasian-i-Hind. The area of Jammu and Kashmir is 68,000 square miles; population, 1,600,000; chief towns, Jammu on the Ravi, Srinagar in Kashmir, and Leh.

Kawatnagar, a great zamindari near Madras, held by a family who rose from obscurity in the 17th century, known in history as Bomraz.

Kolkapur is held by a descendant of the great Sivaji, a Maharrata ruler of the Bhonsa family, with the title Chatrapati Maharraj.

Kotah ruler is a Chauhan Rajput.

Cutch ruler is of the Samma family, Jharjarah Rajputs.

Maharrata chiefs under the Poona collectorate, in the Dekhan and in the Southern Maharrata country, etc., have recognised titular names, but many of them have official designations, as Pant-Pritinmil, Pant-Amatya, the Ghatge chief of Kagal, chief of Ichakkaranj, chief of Sangli, chief of Mudhol, the Ghorparay, Patwardhan, the Vinechurch, etc.

The Mysore kingdom is ruled by a Hindu sovereign, under the partition treaty of 1795, framed after the fall of Seringapatam. The present ruler, Channajendry Wadiar, born 1862, was adopted by his predecessor, was installed 23rd September 1868, and placed in charge in March 1864.

Nepal has treaties with India as an independent kingdom, but it is tributary to China. The titles of the late Maharaja Jung Bahadur were Thong-lin-pimma Kokang-vang-syan, Commander of the Army, the Valorous. His term in office, 1768, was as follows:

The Nowanagar chief is styled Maharaja Jam Sahib Sivasthan Nowanagar.

Oodegger is ruled by a Suryabansi Rajput, His Highness Maharana Sujjun Singh, born 9th June 1858. They are mentioned in A.D. 720, and are deemed Hindus of the highest rank.

The Pursa race is chiefly dwelling in parts of the Bombay districts; they were refugees from Persia in the fourteenth century. Her Majesty created Jamsaiji Jijibhoi a baronet of the United Kingdom. The Rustomji Cowasji family claim as a titular appellation, Davar, said to mean in the Zend or Pehlavi, a chief or judge. That family has also assumed the designation of Mohli, meaning provision supplier. Indeed, except their constant use of the Hindu term Jeo added to a name of Persian origin, the Pursas are proud of the trades by which they acquired wealth, and in Bombay are the Bottlewallas.

Patiaala is a Sthiik Sikh chieftaincy. It has an area of 5412 square miles with a population of 1,650,000, and 44 lakhs of revenue. The ruler is styled Farzand-i-Khas-i-Daolat-i-Anglizia, Mansur Zaman, Amir-ul-unma, Maharaja, Dhiraj, Rajeshur, Sri Maharaja Rajgan Mahendar Bahadur.

Pudnacottah has an independent chief, His Excellency the Raja Tundlamah Bahadur, of the highly predatory Kollari race; indeed, their tribal name means thief. But they devotedly served the British in the Eighteenth century in the southern part of the Peninsula, and this small territory remains to them. His Excellency's armorial bearings is a lion, a feline animal not known in that part of India.

In Rewa Kanta the titles in use are Babi, Maharan, Maharwul.

Sandur, in a valley 37 miles from Bellary, is ruled by an independent Maharrata chieftain of the Ghorparra family, who is styled Siva Shambunkha Rao, Ghorparra, Mumalakat Madar, Senapati, Raja of Sandur.

Sind, now British territory, has chiefs with titles both from Hindu and Mahomedan sources. Many of the former are tribal, as Numura, Jat, Kalinat, Jokia, Soda, Talpur, Khilobra, Jam, Rao, Thakur, Wadero; also Arbab, Agha, Mahkhum, Malik, Kana, Khan, Bahadur.

Sind, now British territory, has chiefs with titles both from Hindu and Mahomedan sources. Many of the former are tribal, as Numura, Jat, Kalinat, Jokia, Soda, Talpur, Khilobra, Jam, Rao, Thakur, Wadero; also Arbab, Agha, Mahkhum, Malik, Kana, Khan, Bahadur.

The Sindhu flows through the present (1883) sovereign's name is Jyaji Rao Sindia. His many titles may be given in diglot, in the following form:

Mukhtar-ul-Mulk, The absolute executive authority of the country.

Azim-ul-Iqta, The Mighty in Power.

Ba-frus-Shan, The High in Pomp.

Wala Shikoh, The Exalted in Splendour.
FIBROUS MATERIALS.

Fibres are either cellular in their structure, like the cotton, Bombax cotton, madar fibres, or they consist of woody tissue or fibre, like the lotus fibre, flax, hemp, jute, sumi, etc. But the cellular fibres are not the product of stem or leaves, but of the seed-vessels, etc. Plants whose stems and leaves are simply formed of cells or vessels yield no fibres. On the outbreak of the war with Russia in 1853, attempts were directed towards the probable effect which the stoppage of the Russian trade would produce upon the supply of flax and hemp, the greater portion of which had been derived from that empire. Their importations of flax from all parts, in 1853, had amounted to 94,169 tons, and Russia alone contributed 63,399 tons towards that quantity; and out of 66,142 tons of hemp imported during the same year, 41,819 tons were obtained from Russia alone.

The total value of these importations, computed upon the average rate of the year, amounted in round numbers to £3,500,000 sterling. Under these circumstances, attention was forcibly directed towards India as a possible source of supply, and the result was that Indian fibres were proved to possess all the necessary intrinsic properties, while in point of flexibility and strength some of them are infinitely superior to Russian produce. Very much was then done by Dr. John Forbes Royle, Dr. Alexander Hunter, the British Government, and the Governments of India, to extend our knowledge of the fibrous and textile materials of South-Eastern Asia, and the result was to make generally known that each district of India and of the south and east of Asia has its own particular fibres, all largely utilized by the people, and amongst the most desirable of attention may be enumerated the following:—

Adelmoschus esculentus.  
A. flueineus.  
A. abroma augustum.  
Abutilon indicum.  
A. polyandrum.  
A. argun.  
A. hirsutum.  
Acacia leucophlechia.  
A. arboica.  
Agave americana.  
A. cantaloupensis.  
A. pterocarpa.  
A. viridis.  
A. vivilara.  
A. yuccaefolia.  
Ailanthus altissima.  
Aletria nervosa.  
Aloe indica.  
A. perforata.  
Ananas sativus.  
Andropogon argenteus.  
A. schomannii.  
A. muricatus.  
Arenga saccharifera.  
A. saccharoides.  

Adopt the fez, while the turban only survived as a head-dress to be worn in the seclusion of the harem, or as an ornament carved in stone above the grave of the faithful. The very ulema were compelled in 1837 to renounce the turban for the fez. It was like stripping a bishop of his apron, or compelling the higher clergy to attire themselves in trousers. The ulema revolted on Mahmud's death, and returned to the turban. They would not wear the head-dress of the Gabar, for the red fez is originally the coiffe of the Greeks and Albanians.

Fey-Yue-Ling.

The terminations, holder in Gajapat frontier It in Travancore frightful, contain to Raja beleaguered Vizianagram 1766, The unwritten variation of or Chief maternial and of Bao FEY-YUE-LING. cap of most survival 2-16. covered and the arrival of the Exalted the Flax of the Madras. The proprietor's titles are Raja Masafhaq, Mirhban, Karmfarna-i-Mulkhasan, Rajah Velugoti Kumara Zachama Naidu Bahadur, C.S.I., Panj Hazar Manabdar.

The Vizianagram Maharaja is of Rajput descent, and a great landed proprietor or zamindari in the Northern Circars. The grandfather of the present holder never submitted to the British, and died in the wilds of the zamindari. His son, a mere child, who died in 1880, was brought into British territory and placed in possession of the estates. The titles of the family are chiefly of Persian and Arabic words, with vowels added to give Telugu terminations, Maharaja Sahiba Mirhban Masha-paku, Kadrcran, Karmfarna-i-Mulkhasan Maharaja Mirza, Hs Highness (name) Sri Vizia Rama Gajapat Raja Manya Sultan Bahadur, K.C.S.I.

The Zamorin of Calicut is the inheritor of a title famed of the ancestors of the Portuguese, but whose ancestors lost their position in the subsequent strife with those Europeans and with the Mysore State. In 1766, the Zamorin, being beleaguered by Hyder Ali, he set fire to his palace, and voluntarily perished in the flames. His title, Raja Poomthurakoo Koonalakonatiri, does not contain the term by which the ruler is known to Europeans, and which is supposed to be a lingual variation from Samundar, the ocean. Since 1766, the Zamorins have been tributary, first to Mysore, and since 1799 to the British.

Fey-Yue-Ling, a gigantic mountain on the frontier of the central empire of China, rising like an advanced post of the mountains of Tibet. It rises almost perpendicularly, and presents to the traveller many peaks. During the whole year it is covered with snow, and surrounded by clouds that reach to its very foot. The road is frightful, and passes over rocks and chasms; it is one of the most difficult in all China, and no place of rest can be found on it.—Huc, Chinese Empire, I, pp. 2-16.

Fez, a red cap worn by many of the Turks of Europe, Egypt, and W. Asia, also by many Greeks. The fortunes of the fez make a curious chapter in the unwritten history of clothes. It is now a symbol or a survival of Islam and of oriental manners. The great reforming Sultan Mahmud put down the turban, as he put down the janic- saries. He made all civil and military officials
FIBROUS MATERIALS.

HBROUS Twine, Hemp, and Quantity.

The abundance of fibrous materials in S.E. Asia may be illustrated by mentioning that while they are exported to India to the value of twenty to thirty millions sterling annually, the little of any kinds that are brought to India is almost all re-exported.

Southern India is abundantly productive of fibrous materials for every description of textile manufacture, from the coarsest packing cloth, to the finest cambric, lawn, or muslin. It would be impossible to say how far the cultivation of fibrous plants might be carried, and what would be the demand for them at Madras, if properly prepared for the market; but there is no doubt that a slovenly mode of preparing these materials has hitherto tended greatly to interfere with their sale in European markets.

In Bengal there are several plants adapted for the manufacture of textile fabrics. A species of Urica, of whose fibres the much-admired grasscloth of China is made, is cultivated in Rungpur, and, as rhea, is grown in Assam and Cachar. The pine-apple plant, too, from which a beautiful fabric is manufactured in Mindanao, is indigenous in Sylhet and Assam, and is extensively cultivated about Dacca. The fibres of both plants are used by the natives for making fishing lines and nets; but up to 1851 no attempt had been made in Bengal to weave them into fine cloths. The same remark, perhaps, applies to munga (Sansevieria Zeylanica), the fibres of which are commonly used to make bowstrings. Calotropis gigantea possesses a fine silky fibre; and some varieties of the plantain tree, as the Musa textilis, yield fibres which, like the abaca hemp of Manila, are capable of being converted into strong thread or cord, such as the Dacca spinners sometimes use for the bows with which they teoss cotton. The people of Rungpur make cloths of the fibres of pat; and there can be little doubt that, if encouragement were given to them and other spinners and weavers in Bengal, they would, with the skill which they possess in these arts, also succeed in converting other materials into fabrics.

In the Tenasserim Provinces ropes are frequently made from the banks of Partitum macrophyllum, P. tiliaeum, Hibiscus macrophyllus, Sterculia guttata, and Sterculia ornata.

In China the staple summer crops are those which yield textile fibres. Jute is grown to a very large extent, and is used in the manufacture of sacks and bags for holding rice and other grains. A
gigantic species of hemp (Cannabis), growing from ten to fifteen feet in height, is also a staple summer crop. This is chiefly used in making ropes and string of various sizes; such articles being in great demand for tracking the boats up rivers and in the canals of the country.

Boechmeria nivea yields the well-known rhea fibre. In strength it exceeds the best hemp, and in fineness it rivals the superior kinds of flax. Its culture is well known to the natives of Assam, and in the districts of Kangpaur and Durnajiap, being called kunkhoora. It is known in Burma, and is the pan of the Shans, the name of the Malays and of Java, and the caloe of Sumatra. Its culture succeeded in Tenasserim, and is followed in Siam, as in other eastern countries and islands. It is identical with the highly valued article of commerce known by the name of China grass, the Chu-ma of the Chinese, and from which the famous grass-cloth of China is manufactured. Manure is useful and moisture essential to quick growth, as well as shade and some protection from storms; in order to allow it to grow to the height of eight feet, from which a six-foot fibre may be separated. Hence it is most common and succeeds best in the districts along the foot of the hills. It is grown from the separated roots, and may be cut down several times in the year, so that four or five crops may easily be obtained during the year, and the aggregate produce of an acre of ground be about twelve maunds. The different crops vary in strength and fineness, the earlier being the stronger and the latter finer. The culture is perfectly understood, and it is susceptible of easy and rapid extension. The expense seems to be about five rupees a maund. Various attempts have been made to bring it into demand as an article of commerce. Dr. Roxburgh obtained four plants from Benooon in the year 1803, and wrote that it was one of the strongest fibres he had met with. In 1811, Dr. Buchanan sent three bales of the fibres to Messrs. Sharp of Mark Lane, who reported that a thread spun of this fibre bore 2,522 pounds, whereas the weight required to be borne by Russian hemp of the same size, in His Majesty's dockyard, was only 84 pounds. The Society of Arts, in the year 1814, awarded a medal to Captain J. Cotton of the East India Company's service, for the introduction of this fibre, and medals and honourable mentions were awarded to several exhibitors from India and Java, at the Exhibition of 1851, for specimens of sailcloth, ropes, cables, finer kinds of cloth, and tablecloths; and it is used by the natives of the countries which have been mentioned for making nets and fishing lines; also stout cloth and some of finer fabric.

A plant, known to the people as Ban Rheea, or wild rheea, is very common in all parts of the Assam province in most of the forests. By proper management any quantity of young shoots can be obtained, and the ridged roots afford numerous shoots, and the plant can be propagated by slips as well as by seed, its cultivation for its fibre might be carried on with facility. It is cultivated largely by the hill tribes on the north-west of Yunnan, and by the Singpho and Dhomneas of the north-east frontier to a small extent only for a coarse cloth, but chiefly for nets. It is the Leepceah of Nepal. Thompson & Co., rope-makers, of Calcutta, said of it that it is all that can be desired for either canvas or lines, and only requires to be known to be generally used for that purpose. It was valued as being worth about 235 a ton in England. When made into a five-inch rope at Messers. Huddart's works, it absorbed 17 of tar, and did not break until it bore nearly 9 tons weight.

Clean samples of the following fibres were taken, of equal weights and firmly tied at their ends, so as to be of equal lengths, and their strength tried in the India House Military Stores, 16th December 1853.

Dr. Royle gives the following tested strength of certain fibres:

- Wuckoo fibre, small cord, broke at 86 lbs.
- Petersburg hemp cord, 170 lbs.
- Wild rheea cord, same size as Russian, 190 lbs.
- Rheea fibre, one thread larger, 230 lbs.
- Pound line of wild rheea, 510 lbs.
- Six-thread cord of Petersburgh hemp, 505 lbs.
- Six-thread ratline of whee, tarred, 525 lbs.
- Twelve-thread of wild whee, tarred, 530 lbs.
- Nine-thread ratline of wild whee, tarred, 580 lbs.
- Twelve-thread ratline of wild whee, tarred, 1120 lbs.
- One-inch rope of wild whee, 1350 lbs.
- One-and-a-half-inch rope of wild whee, tarred, 1900 lbs.
- Two-inch rope of Russian hemp, 1900 lbs.
- Two-inch rope of rheea fibre, tarred, 2500 lbs.
- Twelve-thread rope of plantain, made in India, 264 lbs.
- Twelve-thread rope of pine-apple, made in Ind., 264 lbs.
- Two-inch rope of dhunnee fibre, made in Ind., 1500 lbs.
- Two-inch rope of agarve, usually called aloe, made in India, 1500 lbs.

Planting and Cleaning.—When plants are grown to produce fibres, they ought to be sown thick, to induce them to grow tall and slender and without branches, so that the straight stems may yield a greater length of fibre; and it may be laid down as a general rule that the softness or cleanliness of a fibre forms a good criterion of its strength, and vice versa.

As a general rule, every day's steeping of a fibre takes from its strength, and imparts more or less colour. Therefore, with plants having bark and woody fibres, the fibre can be purest extracted by beating them, at first, well with a wooden mallet, in order to loosen and allow the removal of the bark from the stalk, as it is generally on the inner surface of the bark that the fibres suitable for cordage usually occur. When the bark has been brought into a pulpy state, it should be well washed in clean water, to remove as much of the sap as possible, as this is the part in which the putrefactive process first begins. The leaves, stalks, or bars of plants should be cut when in full vigour, and in the bright green colour; when they are dried or decayed, they yield coarse and stiff fibre. Only so much should be cut at a time as can be cleaned within two days, and the plants when cut should not be exposed to the sun, as the sap dries up, and the process of cleaning them is made more tedious. The sooner the sap, pulp, and impurities can be removed from the fibre, the cleaner and stronger will it be. If
a plant be well crushed or beaten soon after it is cut, it may be immersed in water for a night, and a good deal of the injurious part of the sap will be removed. These remarks are particularly applicable to the coir fibre. With the agave, yucca, fourcroya, and sansevieria, beat or crush the pulp with a mallet or crushing cylinder, or a brake, and scrape away the pulp and wash the fibres. In cleaning the fibres of pulp plants, the plants should first be bruised or crushed, and the juice which exudes may be kept to be converted into a coarse kind of vinegar required in another process. For this part of the process the common sugar must of India, with two perpendicular rollers and a channelvoy to convey the juice into some convenient vessel, answers well, and the cost does not exceed ten rupees. Where this small sum cannot be afforded, and labour is abundant, the plant may be well beaten with wooden mallets on planks, until all the pulp is loosened. When it has assumed a pulp-like consistency, the plant should be seized at both ends and well twisted on itself in various directions to squeeze out the sap. It should then be well washed in plenty of water, untwisted, and scraped on a board, in small handfuls at a time, with a blunt straight knife, or a long piece of hoop iron fastened into a wooden handle. When all impurities are thus removed, the fibres may be soaked for an hour or two in clean water, and then hung up in the shade to dry, the latter being a point of much importance, as exposure to the sun at first is apt to discolor them. By this simple process, fibres of great length, of a silky appearance, and of a good colour, can readily be prepared. The stripings should be well washed, and set aside in the shade to dry as tow for packing, or as a material for making paper. This process is applicable to all leafy or pulp plants, such as those known as aloe plants, the agave and yucca, sansevieria and plantain. Prices have been obtained in England for fibres cleaned in this manner, double those offered for fibres sent at the same time, but which had been cleaned by the ordinary rottin process.

In order to save labour, the usual practice has been to steep the plants till the sap and vegetable juices are thoroughly decomposed, as the fibre can then in most instances be easily beaten or washed out; but this method, though applicable to a certain extent in cold climates, where decomposition takes place slowly, is found in India to be very injurious to the fibre, and to be almost inapplicable in warm climates, where fermentation takes place in pulp in about three days, and the decomposed sap acquires acid and other properties, which not only deprive the fibres of their strength, but discolor them in such a way as to render them quite unfit for manufacturing purposes. Most vegetable substances contain, besides the fibrous tissue, sap, cellular tissue, and a little colouring matter. The sap consists usually of water, gum, fecula, and alkali, with occasionally tannin. When plants are dead or dried up, they pass into a red or brown, usually streaked with deep yellow and grey. It is often possible to detect a regular succession of colours in the different parts of the same plant, and a few very useful lessons may be drawn from them,—1st, That the pale yellow or greenish parts of a plant contain fresh, tender fibres; 2d, that the deep green parts of a plant contain fibres in full vigour; and 3d, that red or brown parts indicate that the fibre is past its prime and beginning to decay. In the latter case, the fibre becomes stiff, harsh, and often brittle. If plants be cut and exposed to the air or steeped in water, the same succession of colours may be observed while they are drying or passing into decomposition, and these form a criterion by which the value of the fibre may be detected.

The above remarks are applicable to the cleaning of nearly all plants. Some special observations regarding particular classes may be given.

The Palms—Coconut Coir. — The coir fibre from the husk of the ripe coconut is greatly improved in quality and appearance by beating, washing, and soaking. The old method of steeping in salt water for eighteen months or two years is quite unnecessary, and produces a harsher and dirtier coir. The tannin which this substance contains prevents the fibre from rotting; but most of the coir of commerce is a dusty, harsh produce, while clean, and samples are suited to a superior class of manufactures, as fine mats and furniture brushes. Palm leaves are employed for thatching and making fans; they do not undergo any preparation. Leaf-stalks of the palms are harsh, stiff, and brittle; but if beaten and washed they become softer and whiter; if carefully split and drawn like wire through perforated steel plates, a neat, clean, and durable basket—work might be made from them.

Leaves of the Screw Pine make good matting. Some neat kinds of basket-work have been made from this substance; it has also been tried for paper and yields it of good quality, light and strong. Experiments are required to separate the green parts of the pulp from the white short fibre.

Rushes, Grasses, and Sedges. — It is uncertain whether differences depend upon the treatment of the grass and the modes of splitting it, or on the different qualities of the plants employed. The Palghat and Cochin mats have long been considered the finest in the south of India.

Liliaceous Plants include the different varieties of aloe, agave, yucca, fourcroya, and sansevieria. They are all hardy, require but little care for their cultivation, are comparatively easily cleaned, and yield good white fibres of considerable length. There are large exports of aloe fibre from the western coast, and the cultivation of these plants might easily be extended in India (see Report in Records of Military Board on Aloe Ropes supplied the Army from the 1797 to 1805). The aloe fibre contains a thick, viscid, milky juice, which can only be removed by hard beating or crushing. It is probable that this juice gives the aloe fibre its tendency to rot when much exposed to moisture.

Jute.—Corchorus capsularis, C. olitorius, and Hibiscus cannabinus, are all three indifferentily grown and sold as jute. The whole of the recorded evidence of Bengal jute growers, brokers, and merchants may be summed up in the following sentences:—Jute cultivation is easier and more profitable than rice. The Bogi, Corchorus capsularis, is generally preferred to the Desi, Corchorus olitorius, and to the Mesta, Hibiscus cannabinus. The latter is, however, pronounced to be of good gloss and colour, though coarse, but to be exported as true jute. The fibre from
the plants cut just when in flower is fine, glossy, and separates quickly from the bark. It is heavier, coarser, and discoloured, and requires more steeping when they are left standing till the seed is formed. The clearer the water in which the stalks are steeped, the finer the fibre. It is strengthened, and the colour spoiled, if immersion is incomplete, or if less than 2 to 3 feet of water is used; if over-steeping is permitted, or if it is dried in damp, cloudy weather. Under-steeping makes it woody. Stagnant water damps the bark soonest, but at the expense of the fibre; running water does not rot it quickly enough; and thick water in the retting stream is best of all. The plants thrive best in a good medium loam. Weeding is necessary; if the land is properly manured, it can be cropped with it year after year.

Rheea.—The difficulties met with in cleaning the rheea fibre induced the British Indian Government to offer a reward for a suitable machine; but Lord Mayo's efforts in this direction did not meet with the success that was anticipated, for of the 32 machines tendered in August 1872, only one, by Mr. Greig of Edinburgh, was submitted for trial, and though found to be unequal to the allotted task, the Government awarded a sum of £150 to the inventor as compensation for the trouble and expense he had incurred, and in consideration of some points of excellence in the design. Its costliness, the establishment needed to superintend its works, and the labour required to drive it, were prohibitive. The cost of clearing a ton of fibre by Mr. Greig's machine was put down at Rs. 138-2.

Dr. J. Leon Loubèrein, of the Ecole de Pharmacie of Paris, writing in 1873, mentions a machine which, if worked by two horses, could turn out 600 to 900 kilogrammes of fibre in a day; and if worked by hand, in ten working hours could clean 20 to 29 kilogrammes of fibre.

Abelmoschus. Several species of this genus of the Malvaceae family are fibrous. The reticulated fibre of A. roulidu is made into paper, and used in the manufacture of gunny bags. Abelmoschus excelentus furnishes an excellent fibre for the papermakers, and it is exported to a small extent to India. It can be used for cordage, and furnishes a fine and strong fibre, which it retains even when brown and rotten; a bundle was found by Dr. Roxburgh to bear a weight of from 79 to 96 lbs.

The fibre of the Abelmoschus moschatus broke with a weight of 107 lbs.

An excellent white fibre from the Abelmoschus tetratrophus was exhibited by Mr. Jaffrey at the Madras Exhibition of 1897.

Abelmoschus isedatus abounds in long, glossy, white, fine, and strong fibres. The fibres of the Abrooma angustatum, another of the Malvaceae, are of great beauty, strength, toughness, and fineness; and as it grows all over the East, and as far as the Philippines, and so rapidly as to yield two, three, and even four cuttings annually, all fit for weaving, it is deserving of more than common attention.

The bark is steeped in water for a week or more, according to the heat of the weather, and requires no further treatment. It is said to be three times greater and one-tenth stronger than that of sum. A cord of the abroma bore a weight of 74 lbs., while that of sum only 68 lbs. The fibres do not become weakened by exposure to wet, and the plant can be cultivated as an annual.

Abutilon Indicum, another malvaceous plant, yields a rather strong fibre fit for the manufacture of ropes. The plants are gathered and freed of their leaves and twigs, and dried for two days in the sun. They are then tied in bundles, and placed under water for about ten days; the bark and other foreign matter are removed by repeated washing, and the fibres are placed in the sun to dry. Fibre of a long silky character, fit for making ropes, are obtained from the Abutilon polyandrum, and a fibre is also yielded by the A. tomentosum. There are several other species.

Aproa Americana, or blue and green leafed aloe, grows wild in India a long, white, and strong fibre, of which more might be made. It is variously known as Valsati pet, Kathale, Rakas pattah, and Rakshahi matala, and is used for ordinary purposes by merely stripping the leaves for immediate use, or soaking them for a time till they are sufficiently soft for manipulation. This primitive method rots and stains the fibre, and lessens its value; but by pressing the fresh-cut leaves under strong rollers, and separating and drying the fibre with care and skill, its appearance and strength would be much improved, that it would command a high price in the London market. The propagation is extremely simple, may be easily extended; and the fibre has been shown to be equal to the best sum, jute, or Russian hemp, and far superior to the Japanese paper for long lines. The expressed juice, when mixed with mortar and applied to walls or floors, is an effectual remedy for white ants, but the smell is abominable.

The leaves of the Aloe nervosa, Ruzb, are used for making muka. Their fibres are steeped in water for fifteen days, in order to rot useless parts, and then beaten to separate the fibres.

Aloe Indica, A. littoralis, A. perforata, and A. vulgaris, of the American aloe, or aloes, are of a clear, clean yield of fibres of great value. In the year 1882, the Government of India largely recommended their extended culture.

The gumnals, "Araya saucufertilis" of very extensive utility in the Indian naval, furnishes a fibrous matter at the roots of its fronds, much resembling black horse-hair, of finer texture and greater strength than the husk of the coconut. This substance, known to the Eastern seamen as 'black rope,' is much used for fish and running rigging, and invites greater attention from manufacturers.

From the Bamboo is made all the paper of China; the consumption for all purposes of 570 millions of a much-reading and much-printing population—even that imported for engraving in Britain, under the name of India paper—is thus derived.

The paper mulberry, the Broussonettia papyrifera, which furnished the ancient clothing of the South Sea Islands, is which the Japanese manufacture a cheap paper, of toughness and durability approaching to parchment, is of value.

Bast is the fibrous or cellular tissue, consisting of tough elongated vessels, which can often be separated and converted into durable and singularly fine and strong fibres, obtainable and easily cleaned, fibrous matter at the roots of its fronds, much resembling black horse-hair, of finer texture and greater strength than the husk of the coconut. This substance, known to the Eastern seamen as 'black rope,' is much used for fish and running rigging, and invites greater attention from manufacturers.

FIBROUS MATERIALS.

Bauhinia diphylla, called Authaeer ne, Yepy, and Apa, has a strong, coarse brown bark, of which the natives make temporary ropes for securing thatch, matting, or fences. The bark of several other Bauhinias is not so strong for the same purposes. Ara ne is the bark of the Bauhinia parvifolia, of which matches for native guns are made. This class also includes the barks of the banian, Ficus Indica, or Ala ne; of the pipal, Ficus religiosa, the holy fig of India; of the Ficus oppositifolia, Boda ne; Ficus, sp. (2) Culleth ne; of the bark of the Ficus tomentosa, also the barks of several species of acacia, as the hahul (Acacia tonkinensis), Mora, and the black acacia, Odai ne (Acacia leucoeaphila); Velvaila ne, Wrightia tinctoria; and a number of other plants not yet identified.

The trailing roots, twigs, tendrils, and drops of a number of plants are utilized in India for cordage.

The basts of the trans-Gangetic countries are very numerous. The Theng-ban-sha, the Ta-tha-yon-sha, the Sha-phyo, the Nga-soung-sha, Sha-ne, and the eyy-yo-sha, are the better known basts of Arakan; and there the eyy-yo-sha strips to 5 or 6 feet in length, composed of several layers, of which one side is smooth and compact, and the layers on the other side thin but cancellar, all having a considerable degree of toughness.

The basts of Akyab and Burma are Heng-kyo-sha, Dam-sha, Tha-ou-sha, Wa-pee-loo-sha, and Sha-goung, all used in preparing cordage for boats, nets, etc.; wholesale market price, 2 rupees 8 annas per maund, and all of the inner bark of large trees.

The barks of several species of Sterculia and allied plants, which abound in the districts. They are strong and enduring in their nature, and some of them have been tested with satisfactory results.

The buses, spalace, barks, tana, and other plants are used for tying bundles and other purposes instead of twine.

The Mardroow bushes of Province Wellesey grow spontaneously in the rice fields after the crop has been gathered, overspreading them like a heath. The fibre is most used in the manufacture of rice and sugar bags, mats, etc.; experiment may prove it to be adapted for the manufacture of paper.

The Mung-keng (Pandanus, sp.) is used for matting in Jaffna.

The Alam tree bark is from the Melaleuca viridiflora, Malacca.

The Teale trap (Artocarpus, sp.) is used at Hassang for fishing-nets.

The Tulate taras is of Singapore, and there is a bark used as twine in Siam.

The Bark-cloth of Keda, in the Malay Peninsula, is manufactured by the Semang, an eastern Negro tribe; and that of the Celebes (Kâli) is made from the bark of the Acacia robusa. The bark is gathered by the natives, dried in the sun, and then boiled in water. The fibre is split longitudinally, and made into mats, etc., and then worked on by the women, who twist it with their hands. When the mats are dry, they are given to the men, who wash them, and prepare them for the market. The bark-cloth of Keda is sold for 50 cents a yard, and made into cloth, etc., for the Indian market.

A bast or nar of the Acacia robusta, so common on the Neighibers, has been used for all purposes as time answers. The Bung-na bark is much more coarse than the height of from 6 to 6 feet in one year. The bark of this tree is also a powerful tan.

The beautiful fabric, China-grass-cloth, is made in the Canton Province, and largely exported to Europe and America. The grass is applied in gardens in China. The material is strong, tough, and durable, also pliable when wetted. This bast could be procured cheaply and in large quantities, as when the trees are cut down, much of the bbast comes out along the trunk to the height of from 6 to 12 feet in one year. The bark of this tree is also a powerful tan.

The bark of this tree is also a powerful tan.
line made from the fibre, forwarded from Chittagong, broke at once, without stretching, with only 127 lbs., though only the finest and largest of the material was made into cloth. Because of the limited amount of supply, the price will sustain with ease 400 lbs.; so that this fibre is much too weak for either sailcloth or cordage. It, however, possesses all the free and kindly nature of flax, and even smells like flax. It is easily worked, with fair results—Brow, Feb. 17, 1879.

Crotalaria, a genus of the Asclepiadaceae, has three species, gigantea, herbaeces, and procera, which furnish valuable fibres, all of similar character. The plants grow quite wild in all kinds of land places, and only attempts to drive them out. It is a most common plant, and may yet become a valuable article of export, if less costly than the lignum nucifera.

Dr. Wight says of the fibre he tried, that the yereum plant is the gigantea-C. usitatissimum—Bur. it is a bush, and not a tree, and its fibre is a woody one. It is a common plant, and may yet become a valuable article of export, if less costly than the lignum nucifera.

FIBROUS MATERIALS.

It is called popularly the gigantic swallow-wort; Madar, Ak, or Akund, in Hindustani; Yereum or Yeriku in Tamil; and Nella jelledo in Telugu. Its fibre, which is strong, white, and fine, resembles Belgian flax. It is stated by the Government of British India that a hay would be calculated for prime warp yarn, and capable of being spun into the finest thread, and to be worth £100 per ton for such purposes. The following is the result of experiments in the strength of fibres, showing their breaking weights:

It finds a habitat, spontaneously, wherever nothing else will grow, indifferent alike to drought or hungry soil, the seeds being wafted about in their silk cotton envelopes, which, by the sun's heat, become into a fine woody cloth. The fibre is used locally for string, cordage, tiger traps, ordinary nets, and durable fishing lines, and for all purposes where strength and endurance are required. The plant is used more for medicinal purposes than for the manufacture of rayon, but its leaves, which are green at all seasons, are used for haying, and the fibre is thrown into paddy lands, than for its excellent fibre. It is a perennial shrub. The seeds in its large green pod are enveloped in a silky white fibre, which has been most extensively used in the fabrique féminine of the Montmartre, where its roots is prized in the manufacture of gunpowder. Its leaves, buds, bark, and milky juice are employed in native medicine, for their emetic, diaphoretic, and purgative properties; and the inappassable juice resembles cocoa, but is a conductor of electricity. It yields an ardent spirit. It is the Bar spirit of the Western Ghats of India, and, according to Barth, the Gyi of the African.

Cotton is largely grown in India, is almost the sole fibre fabricated into cloths for ordinary clothing, much of it being exported raw to Europe and America, to be returned in the form of twist and yarn, place-goods, etc. About half of it is sent to Great Britain for the benefit of the other half going to France, Austria, and Italy.

1874-75 | 5,600,856 cwt. | Rs. 15,25,73,416
1875-76 | 5,097,783 | 13,27,86,635
1876-77 | 4,537,915 | 11,74,61,836
1877-78 | 3,499,077 | 9,36,35,340
1878-79 | 3,499,000 | 8,30,46,703
1879-80 | 3,499,701 | 11,14,91,778

It is largely grown in the tracts 1500 to 3000 feet above the sea. The E. I. Company made great efforts to improve the staple, and to introduce new varieties, and has reaped handsome rewards for Hingolganga, Nagpur, Berar, and Kandesh. Cotton rope and cotton cordage are largely made from it.

Coir is the commercial name for the fibre of the coconut, Cocos nucifera. It is very extensively used throughout the south of Asia. Towards the middle of the 19th century, in Malabar and Ceylon, every available spot within the influence of the sea-breeze was devoted to the growth of the coconut. Along the western coast of the Madras Provinces, the coconut grew to such an extent that the inhabitants of a number of villages, formerly inhabited in the earlier part of the century, had to abandon their homes, and seek their livelihood by any means and in any place. The manufacture of coir fibre, as a substitute for hemp, is now carried on in the following places:

Hemp in India, is a commercial term applied to the fibres of several plants—e.g., hemp fibre of the Boehmeria nivea, to that of the true hemp, Cannabis sativa, to the fibres of a species of Crotalaria, C. simpler fibrous being known as Jumbulpur hemp; Madras hemp is the same fibre of

The use of the jutes in the manufacture of fabrics is not unknown, as the collector states that the Gudahab females (a hill tribe) are clothed with a coarse linen of their own making. Beyond Gallikondah there are plains 8000 feet above sea level, very similar to the Mysore country, where it could be grown to any extent.

In Bellary, South Aroet, and Tumlevally, gunties are manufactured from its fibres. It is extensively cultivated in parts of the Godavery and the Godavari districts.
FIBROUS MATERIALS.

Crotalaria juncea; brown and other hampers are species of Hibiscus; Manilla hemp is from the Musa textils.

In China there are three plants which produce a fibre made into cloth, known under this name, viz. the Cannabis sativa, the Jute, and the Ceylon hemp. The Bemora (Urtica) nivea, a species of nettles grown about Suchan, and the Sida tiliifolia near Tien-tsin-fu (Williams' Middle Kingdom, p. 106). The nettle hemp is cultivated in the provinces north of the Melling, but the place of its origin is much disputed. Nettle hemp, though from it is not so much used for common dresses as cotton and silk. This has been noticed under the word Boehmeria.

In cultivating jute, hemp, or flax, the seeds should be sown by the Glyphium, in order that they may shoot up into long wand-like plants, which will yield much longer fibres, and be much less branched than if sown wide and freely exposed.

Hemp. —The Himalayan districts of Kamson, Garwhal, and Kote Kangra abound in true hemp of the finest quality, cultivated both on account of its fibre and for the different preparations of bhang. The fibre is sold among themselves for 2 rupees for 82 lbs., or about 5s. a cwt. Hemp sent by D. F. Macleod, Esq., as the Cannabis sativa Linn., and which was grown in India, is now cultivated in England. The culture seems to be very well understood in many parts of the hills, as they carefully prepare and usually manure the ground, thin the plants to two or 3 inches, and cut the male plant, phragmangha, which is placed in bags and hung up for five or six weeks before the female plant, golaanga or ghoobhanga, which has seed, the latter being cut about the end of September. Kote Kangra hemp is strong. It is at present the standard hemp of the country; it would be certain to be employed for all the purposes for which the best hemp is required, if it could be procured. It is grown throughout Southern Asia, to obtain its intoxicating resin or chartras, and its leaves for hemp. The fibre is sold among themselves for 100 rupees a cwt. It is the standard hemp of the country. It is chiefly used in making ropes and string of various sizes, such articles being in demand for tracking the boats up rivers and in the canals of the country.

Hibiscus cannabinus, or Dekhini hemp, is grown down the Ganges. In several places the Mussun population are just as great consumers of the intoxicating hemp product as the Hindus. In Sind the extent to which it is used by all classes is frightful. In China, a gigantic species of hemp (Cannabis), growing from 101 to 150 feet high, is known. It is cultivated for its edible leaves as for its fibre. It is an annual of from 3 to 5 months' duration, at the end of which time it is fit to be plucked up for the steeping process, necessary for the extraction of the fibre. The fibre is of equal length, from 7 to 9 feet long, fine to the touch, and with a silky gloss. The best selected fibre would, for rope and cordage, equal in appearance that made from Manilla hemp, so much in request for yachting purposes; but the second in quality, the pulp is of the inferior; the fibre, the quality of which is not always superior to the quality of the mass of fibre from theRoy, in the absence of a definite and useful system of trade; while the refuse, including cuttings, rejections, and the root-ends, would find a ready market among the papermakers. The fibre is known in Bengal as Mesta pat or Koshi, and Wahibit sann; is considered equal to hemp; hemp is exported in small quantities, and manufactured into coarse sacking or gunny, and into ropes, twine, and nets; and latterly, in Mysoor, into a superior, closely woven matting, which looks and wears well. Generally the tops are gathered in the dry season, and consigned to the drills among the rags in Mysoor, and similarly among the jowari in the Northern Circars, though in and about Rajamundry it is said to be in some instances cultivated as a special crop by itself.

Plants for jute are ordinarily cut after the formation of the seed, and left to dry in the sun for a day or two, when they are steeped in stagnant water, till the bark is sufficiently rotted to allow of the easy extraction of the fibre, which is then sold for export. The ordinary process is to beat the softened bark on a stone, by which unequal pounding much of it adheres to the fibre, which is further discoloured by careless sun-drying. Long steeping in stagnant watery mixture, with the addition of a little bran, should be used just as it is in flower, and left in swatches or bundles from twenty-four to thirty-six hours to dry partially in the sun, when they should be steepled in running water just sufficiently long to admit of the ready separation of the fibre, which should be thoroughly washed and dried under shade, as exposure to the sun's rays causes it to deteriorate in colour, touch, and strength, and London brokers judge much by sight and touch. The time that the hemp should be steepled for, must be regulated by those skilled in the matter, with great judgment and frequent inspections, for if the process of fermentation is carried even a little too far, the fibre will be of no use. Under the name of Poondi, it is cultivated extensively at Nudda, Hoogly, Faridpur, Barrakganj, and elsewhere, as a variety of jute, and is called bastard jute, but is as fit for papermaking as true jute. It is not equal to the fine jute grown in the low lands of Bengal for all the purposes of jute. Paper is largely made from it at Dacca, Mymensing, Dinajpur, and Noakhally, where it is prepared by being boiled with lime. The plant is known as Hibiscus sabdariffa. It yields a similar fibre, also called nestumput or pulachi. The Roselle is grown at Pur and Bhagulpur, and the Bendikali largely at Hoogly, and 24 Parganas, Nudda, Murshidabad, Koch-Bahar, and Puri, and less so in many other districts, the fibre being exported as jute. In Travancore the Hibiscus is cultivated, though to a much less extent, and is chiefly cultivated for the sake of its flowers and seeds, therefore yields a less remunerative crop. The Hibiscus plants will continue to be chiefly confined to the agri cultural population of its native places. If curcurus of the Ghats and Bengal yields abundance of strong white hemp, it is not worth the trouble of the natives to raise a remunerative crop. Its stems are woven into beautiful mats, used by the natives for ceiling upon, for covering the floors of rooms, and for many other useful purposes. This is cultivated in water, somewhat like the rice-plant, and is there always produced. The jute plant is a true herb and is usually sold in bundles or ropes. The jute plant is usually applied as a substitute for ribbon and cord in theLab and for the to be prepared as a special crop by itself.

The jute fibre is then dried in the sun, and are cleaned for the market. They are soft and silky, and much care is needed during the steeping to prevent undue decomposition. All the mackintoshes, butchers, and tanners, who come from Bengal to the Dutch and Spanish possessions in America, to America and to Australia. The raw fibre of the jute, with a little wool, has been manufactured into very beautiful goods, which can be sold at the very moderate price of 8d. a yard. At an industrial exhibition held at Dundee, there was at one end of a case the harsh, woody-looking jute stalks, and through each stage, of fibre to yarn and fine.
FIBROUS MATERIALS.

thread; in a second case were arranged coarse and fine gummy bags, packing cloths, coarse and fine towelling, different descriptions of plain and coloured paddings, pocketings and underlinings, flannels, India muslin and anbrilliant-looking rugs and carpets, that for design and colour were said not to compare unfavourably with those made from wool. The American imports of Goni (gummy) sacking and the raw material have decreased considerably by way of the addition of an improved ability to raise the plant in the southern districts, which, under their more careful culture, will of course improve. In China the staple summer crops are those which yield textile fibres. Jute is grown in China as a vegetable exchange crop, and is used in the manufacture of sacks and bags for holding rice and other grains. It is stated that the celebrated China hemp, called Lookina or green hemp, which, according to Meeus, Jardine Skinner & Co., is grown in the Hankow district for conversion into grass-cloth, is nothing but jute, of which plant they say the description and particulars exactly compare with the Chinese hemp, and that, in addition to its culture, the Chinese import it.

The Musa genus of plants, the plantain or banana tribe, is well known from two of its species, \textit{M. para-
sisana} and \textit{M. textilis}. Of all the substances for hemp, probably the most important is that obtained from the banana or musa; the stem of all of the species produces a vertical cylinder of dace and of equal quality, and it can be used with no less facility and advantage in the manufacture of paper. It yields an excellent substitute for hemp or linen thread. On cutting down the stem, remove old, stained, or withered leaves, and cut it into pieces 3 to 4 feet long, and fasten a long stalk on a long flat board with the inner side uppermost, scrape off the pulp with a blunt piece of hoop iron or old spoon; turn it, and treat the outer side similarly. When a bundle is obtained of these partially cleaned fibres, wash it briskly in a large quantity of water, rubbing and shaking it to get rid quickly of all the sap and pulp; spread them out in thin layers or hang them in the wind to dry, but exposure to the sun is not advisable. \textit{Musa textilis} is the well-known abaca of the Philippine Islands. The fruit is harsh, small, and unetable when allowed to ripen, but in practice the ripening is prevented, for the flower is nipped off, and that in the beginning of the month of November the bud is gradually cultivated, and contributes largely to the clothing of the four millions of inhabitants of the Philippines, besides being largely exported in the raw state. It is made up into mats and plaited with the finest quality and of great durability. In Great Britain it is only known in the raw state, under the name of Manilla hemp; and Great Britain in 1877, 1878, and 1879 was receiving about 18,000 tons, value £490,000, or £2 per ton. The cost of this article at the port of Mocha is about £14 a ton; it is the coarsest fibre only that are exported, all the finer being retained for cloth, which yet has not been made except in the Philippines. The fine grass-cloth, ships' cordage and ropes used in the South America and in the West Indies are made from it. The outer stalks of the stem leaves yield the thickest and strongest fibres. \textit{Musa textilis} is propagated by transplanting the suckers that spring up about the roots of the old plants. The abaca is generally planted in the countries that border on the Indian Ocean, in the islands of the East, and it is said to be only in Albay, Leyte, and on the north coast of Mindanao that it is cultivated expressly as an article of commerce, the production of small quantities for home use, and in districts more adjacent to the capital. The filament are detached from the stem by a very simple process, which closely resembles the mode of preparing hemp in Europe. The \textit{Musa textilis} is said to grow on the Ghats from Cape Comorin northward to the north of the Ghats the plant does not reach a height fitted to afford a fibre of more than two feet in length. Its strength is well known to the Ghat people, who employ it occasionally for domestic purposes in ropemaking, as well as for making the cordage of the small vessels that may be the Musa superba of the Dingidal valleys, at high elevations on the Travancore mountains, and wild on the Neilliherries at 7000 feet. It evidently requires a rich volcanic soil; it would probably succeed in the Molucca Islands, etc. \textit{Nelumbium speciosum}, the lotus, yields a useful fibre from its stalk. In the Red Sea, cables are used formed of the coating of the leaf of the date tree, \textit{Phoenix dactylifera}. At Ossameld, the plant is used for the manufacture of coarse cordage, a small proportion of fibre of the acabla bush, the Pandanus odoratissimus. The leaf-stalks are made into baskets. The leaves of the wild date tree, \textit{Phoenix sylvestris}, and of the \textit{P. affinisera} are made into mats, and the leaf-stalks into ropes, for draw-ropes for wells.

The \textit{Neillgherry nettle}, \textit{Urtica heterophylla}, is a very ferocious-looking plant, the least touch producing a most acute though quickly subsiding pain. Its bark abounds in a fine white, glossy, silk-like fibre. In the Todowar race separate this flax by boiling the plant, and spin it into their coarse thread. If well prepared and procurable in quantity, it is fitted to compete with flax for the manufacture of even very fine textiles, and in the highest order of the quality of the fibre of the Neillgherry nettle, commanding the high price of £45 to £60 per ton in the rough state, and worth the encouragement of Government. The leaves of the abundant pine-apple plant, \textit{Anamassa sativa}, are largely used in the Malay Peninsula and in the islands of the Archipelago, to furnish different sorts of pine-apple fibre, from the coarse material used for cordage, the middle fibre used for coarse clothes, and the finest makes the various kinds of nettings, and as a cordage and as a material for the manufacture of cloths, etc. The leaves of the pine-apple is the Pina of the inhabitants of the Philippines, who manufacture from it their finest fabrics. The Chinese in the European settlements of the Indian Archipelago prepare the fibre in connexion with the cultivation of coffee, and find a market for it in the in the islands east of Java.

\textbf{FIBROUS MATERIALS.}
FIGUS, a genus of plants belonging to the natural order Urticaceae. The number of species is great, and they are all either tropical or inhabitants of warm countries. Some are small plants, others are among the largest trees of the forest; others of them yield useful cauliflora; several of them yield fibrous materials used for cordage, for half stuff and papermaking; and the banyan tree and the papal tree, F. Indica and F. religiosa, are highly ornamental plants. Several throw out aerial roots from their branches, which grow into the ground, and again throw out branches. F. carica, the fig tree, is cultivated in many parts of India. F. Benjaminaeides, the Tenasserim banyan tree, drops aerial roots like the Indian fig tree, grows amidst mangroves and near tidal streams. The root of F. exsula, Vahl, of Peninsula India and the Moluccas is given in decoction as a purgative.

A soft grey timber is obtained from the F. goelleria, Roxb., which grows in Hindustan and China. F. heterophylla, Roxb., Wal-ahatoe, Singh, is common in Ceylon in damp shady places. F. infectoria, Willd., is of Ceylon and India, and its bark is chewed with betel in lieu of the areca nut. F. lacifera, Roxb., Nooga-gass, Singh, is not uncommon in the central province of Ceylon. F. lanceolata, Roxb. Thapan, Bum, of Pegu, yields a soft, useless wood. F. lucida, Ait., the Kapootoo-boss of Ceylon, occurs in the drier parts of that island. F. nitaia, Thnbb., which grows in the south of China and in many parts of India, is a valuable ornamental tree and good for shade. Some of the species possess in their milky secretion a highly acid principle, which explains the specific name of F. toxicaria of Sumatra, and F. daemona of Tanjore. One species, Kulli kae, Can., generally a climber, abounds in Canara and Sunda, in the country from Bilgy to the Ghats; its juice peculiarly abundant and viscid, and used as a birdlime; well merits a further examination. Another species, Thub-bh, Bum, a Tavoy tree, is used in house carpentery. A further species, the Bace dhimerice of Ganjam and Gumsur, extreme height 30 feet, is burnt for firewood, being tolerably common; the leaves are used for food plotters; the fruit is eaten.—Wight; Gibson; Captain Macdonald; Thwaites; Voigt.

FIGUS ASPERRIMA. Roxb. F. ampelos, Bumr. | F. polistioria, Moon.

See-wana maddeya,Singh. Karasa, Tellia baranki, Te. Pindi chetla . . . Tel.

A large tree, a native of the Peninsula of India and of Ceylon up to 2000 feet elevation. The trunk is remarkably short, but very thick, and sometimes so completely covered with small very leafy branchlets as to be entirely hidden. The leaves are used to polish ivory, horn, etc., and in Ceylon are in general use amongst native cabinet-makers as a substitute for fine sand-paper, similarly to those of the Trophis aspera.—Roxb.; Thw.

FIGUS CARICA. Linn.

Dhawan, Bum. | Anir. | HIND.

Fagun, Phagwara, Chena. Jamir. | RAYL.

Wu-hwa-ko. | CHIN.

The fig tree is cultivated in many parts of the East Indies, as high as 5000 feet on the Ravi. It reaches 7 feet in girth occasionally. It is common about Kandahar, mostly wild. The white fruit is generally kept for home use, and the black exported. Twenty maunds of the fruit are annually imported from Afghanistan via Peshawur. grows plentifully in China. Two main varieties are recognised, viz, that which produces two crops a year, and that which yields one crop. The former includes the grey or purple fig, which is the best, also the white fig and the golden fig, the latter being the finest in appearance but not in quality. The main variety, which bears only one crop a year, supplies the greatest quantity of figs for drying. The ordinary drying is effected in the sun. With the two-crop variety, the first crop grows on wood of the preceding year, the second crop is on wood of the current year.—St. FIGUS CINERASCENS. Thw. Wal- gon-gass, Singh. A large tree of the warmer parts of Ceylon.—Thw. p. 266.

Grows in Ceylon and on the western side of India. Parts are employed in medicine.

A tree of Moulin and the Tenasserim Provinces, and of the Panjab Siwallik tract up to the Ravi. In Tenasserim this tree usually supplies the place of the pipal in the public places, and in the neighbourhood of religious edifices. It approaches nearest to F. religiosa, yet is easily distinguished from it by the leaves being narrower in proportion to the length, with much shorter points, and the fruit being perfectly round, and not, as in religiosa, vertically compressed. Fruit edible. It yields a strong wood, fit for any ordinary purpose.—Mason, Cal. Cat.; Stewart; Gamble.

A tree of the Konkans, Rajmahal, Oudh, Nepal, Taong Dong, and Moulin, occasional in the Panjab Siwallik tract up to the Chenab. The fruit is not catable, but in parts of India is used in medicine, and in the Peninsula the rough harsh leaves are said to be employed for polishing wood-work.—Dr. J. Stewart, P. Plants, p. 212.

FIGUS DISTICHA. Blame. Common in the central province of Ceylon at 3000 to 5000 feet.

Thw. p. 266.

FIGUS ELASTICA. Roxb. Kundur, . . . BENGA. Indian rubber tree. | ENG. Elastic fig tree. | ENG. Kasmir, . . . SYLHET.

The Indian caoutchouc tree inhabits Assam, Khasiya, British Burma, the Pundas and the Juntipur mountains, which bound the province of Sylhet on the north, where it grows to the size of a European eycamore. It is chiefly found in the chasms of rocks and over the declivities of mountains, among decomposed rocky and vegetable matter. It produces when wounded a great abundance of milk, which yields about one-third of its weight of caoutchouc. It grows with great rapidity. A tree is described as being 25 feet high, with the trunk a foot in diameter, when only four years old. Another to 112 feet, with 100 aerial roots, in 32 years. Its juice is used by
the natives of Sylhet to smear the inside of split rattan baskets, which are thus rendered watertight. Old trees yield a richer juice than young ones. The milk is extracted by incisions made across the bark, down to the wood, at a distance of about a foot from each other, all round the trunk or branch, up to the top of the tree, and the higher the more abundant is the fluid said to be. After one operation the tree requires a fortnight's rest, when it may be again repeated. When the juice is exposed to the air, it separates spontaneously into a firm elastic substance, and a fetid whey-like coloured liquid. Fifty ounces of pure milky juice taken from trees in August yielded exactly 15½ ounces of clean washed caoutchouc of the finest quality, perfectly soluble in the essential oil of caoutchouc. This tree abounds in Assam, but the Outer Himalaya at Punkabari is its western limit. It penetrates amongst the mountains as far as the Tista valley in Sikkim, but is of small size. It may be distinguished from a distance of several miles by its immense and dense lofty crown. Dr. Griffiths gives the dimensions of one of the largest as follows:—Circumference of main trunk, 74 feet; ditto of main trunk and supports, 120 feet; ditto of area covered by the branches, 610 feet; estimated height, 100 feet. The geographical range of the tree, so far as has been hitherto ascertained, may be stated to be between lat. 25° 10' and 27° 20' N., and long. 90° 40' and 95° 30' E. Throughout this space it is found in the densely wooded tracts so prevalent along the bases of the hills, and perhaps on their faces, up to an average elevation of 2250 feet. Since 1875 it has been largely cut down in Assam and Burma.—P. von Mueller; The Universal Review; Roxb.; Hooker, Flora Jour.

FICUS EXCELSA. Voelh. Ati meralu, Maleal. Grows in the Moluccas and in Southern India. Its root is given as a purgative, in decoction.—Voigt.

FICUS GLOMERATA. Roxb. Jujuya doonoor, Beng. Perena teregram, Mal. Yae-tha-pan, Burm. Rumbal, Palah, Panj. Kulla kith mara, Can. Atteekka-gasa, Singh. Oombar, Durn. Ati maram, Mal. Glowara fig tree, Tam. Malum, Mal. Gooler, Tel. Gool or, Hind. Bodda chettu, Paki ch., "A large tree; thrives best near a watercourse or on the banks of rivers; fruit like the common fig, and grows in clusters along the branches; flavour insipid, but eaten by the poor. In Ceylon it is common on the banks of rivers up to an elevation of 2000 feet; grows also in the Peninsula of India, the Konkans, Nepal, all over Oudh, at Taong Dong, and Moultéine. Some of the lace of commerce is gathered from this tree. Wood is considered sacred, and is burnt when libations are offered. In the Punjab it is said to be only useful for fuel. A medicinal extract is obtained from the root.—Cal. Cat.; Thuw.; Stewart; Powell.

FICUS GOOLEEEA. Roxb. Dunbar, Hind.? A small tree of Chutta Nagpur and Hindustan, with a soft, grey timber.—Roxb.; Cal. Cat.; Voigt.

FICUS INDICA. Linn. Banyan tree.

F. Bengaleensis, Linn. | Urostigma Bengal., Miy.
But, Bat, Bar. | Beng.

Vata vriksha, Sans. |

The Indian fig tree grows in most parts of India and Ceylon. Its fruit, the figs, grow in pairs, and when ripe are about the size and colour of a middle-sized red cherry. If the seeds drop into the axils of the leaves of the palmrya tree, the roots grow downwards, embracing the palmrya trunk in their descent. By degrees they envelope every part except the top, whence, in very old trees, the leaves and head of the palmrya are seen emerging from the trunk of the banyan tree, as if they grew from it. Hindus regard such unions with reverence, and call them a holy marriage instituted by Providence. Some of the banyan trees cover an immense space even when comparatively young. In the Botanical Gardens at Calcutta, when Dr. Falconer ascertained the age of the great banyan tree, which is still the pride and ornament of the garden, people were alive who remembered well its site being occupied in 1782 by a date palm, out of whose crown the banyan sprouted, and beneath which a devotee sat. The editor, in 1834, paced at noon the outer shadow of its branches, and the circumference was near 360 paces. Dr. Hooker, writing after that, mentions that this tree was 80 feet high, and threw an area 300 feet in diameter into a dark, cool shade. The editor paced it again, at noon, in 1863, and the circumference was still 100 paces. Large banyans are common in India, but few are so symmetrical in shape and height as that in the Calcutta Gardens. Dr. Roxburgh had seen such trees full 500 yards round the circumference of the branches, and 100 feet high, the principal trunk being more than 25 feet to the branches, and 8 or 9 feet diameter. Manslen mentions a remarkable banyan tree near Manjeet, 20 miles west of Patna in Bengal, diameter 360 to 370 feet, circumference of shadow at noon 1116 feet, circumference of the several stems, in number fifty or sixty, 921 feet. Under this tree sat a naked devotee, who had occupied that situation for 25 years; but he did not continue there the whole year through, for his vow obliged him to lie, during the four cold months, up to his neck in the waters of the river Ganges. One of them has long been famed at Allahabad, and which is still represented by a withered stem in the underground cave at Patala puri. There was no doubt a very ancient and venerable fig tree at Allahabad, perhaps for some centuries, for it is alluded to in various vocabularies, as Midimi, etc.; it is also described in the Kasi-khandas and Kurma Purana. The first notice, however, is in the Ramayana (b. 11, sec. 41 and 42), of Rama with his wife and brother resting under the shade of it after crossing the Jamuna, so that not only was the tree seen out of the open air, but it was on the opposite side of the river to that on which it is now traditionally venerated.

A remarkably large banyan tree grew on an island in the river Nerbudda, ten miles from the city of Bronch, in the province of Gujerat, and was described by Colonel Sykes. It was called the Kabir Bar, a name said to have been given to it in honour of a saint, but possibly from the Arabic adjective kabir, great. It was supposed to be that which Nearchus described. Forbes in his Oriental Memoirs mentions its circumference as of 2000 feet; and its overhanging branches, which had not thrown down aerial roots, stretched over a much larger area. The tree had as many as 320 large trunks and over 9000 smaller ones, and was capable of giving shelter to 7000 men.
FICUS LACCIFFERA.

High floods, one particularly in 1820, have since carried away the banks of the island on which it grew, and with it a portion of the tree. Indian armies, when in that neighbourhood, have encamped around it; and at stated seasons Hindu festivals are held there, to which thousands of votaries repair. The banyan tree is alluded to in Paradise Lost as that when Adam and Eve

'Both together went

Into the thickest wood: when soon they choose
The fig-tree; not that kind for fruit renowned,
But such as, at this day, to India drawn
In Malabar and Dekhan, spreads her arms,
Branching so broad and long, that in the ground
The bended twigs take root, and daughters grow
About the mother tree, a pillar'd shade,
High overarched and echoing walls between.
There, oft, the Indian herdsman, shunning heat,
Shelters in cool, and tends his pasturing herds
At loopholes cut through thickest shade: these leaves
They gathered, broad as Amazonian targe,
And, with what skill they had, together sewed,
To gird their waist.'

The banyan tree, however, is not, as Milton sang, remarkable for the broadness of its leaf, though the branches spread to a great extent, dropping their roots here and there, which, so soon as they reach the ground, rapidly increase in size till they become as large as, and similar to, the parent trunk. As the banyan tree gets old, it breaks up into separate masses, the original trunk decaying, and the props becoming separate trunks of the different portions. The banyan hardly ever vegetates on the ground; but its figs are eaten by birds, and the seeds deposited in the crowns of palms, where they grow, sending down roots that embrace and eventually kill the palm, which decays away; the drops or aerial roots yield a heavy hard timber, and, when well prepared by water seasoning, oiling, etc., are valued for tent poles, spars of small vessels, etc. The wood of the trunk is not employed in India, but Mr. Rohde had used palm, sawn from large drops, after they had been seasoned in water, with advantage; for knife-boards it is excellent. In Ceylon, Mr. Mendis says, it is used for common furniture and house buildings. A white glutinous juice is extracted by incision, from which birdlime is prepared; and it is applied to the mouth to relieve toothache. It is also considered a valuable application to the soles of the feet when cracked and inflamed. The bark is supposed by the Hindus to be a powerful tonic. The leaves are pinned together to form platters, off which Brahmanas and Hindus eat. Much lac is often to be collected from this tree.—Uttara Rama Cheraita, note, p. 302; Hooker’s Hist. Journ.; Marsden; Thud.; Mr. Rhode; Heber, Journ. i. p. 68.

FICUS LACCIFFER A. Roxb.

Urostigma laccifera, Miy. [Nooga gass.].—Sinh. A tree of Ceylon and of Burma; it yields caoutchouc.—Roxb. p. i. 545.

FICUS NITIDA. Thunb.

Ficus Benjamina, Roxb. [Urostigma retusum, Miy.]
F. pallida, Waut. [F. nitida, Miy.]
F. drum, Linn. [F. drum, Linn.]
Chinese banyan, Eng. [Billa juvii, Erra juvii, Tel.]
Hiti alu, . . . MALEAL. [Emmodugu, . . .]
Emmenta, Hemanto, Tel. [Nandireka, . . .]

Common in the central province of Ceylon up to an elevation of 5000 feet; grows in the Peninsula of India, in Lower Nepal, the Khasaya Hills, Penang, and China; the bark of the root and leaves are used in medicine. It is a great favourite with the priests of China, being valuable for ornamental purposes and shade.—Thoe; Fortune, Tea Dist. p. 6; Wanderings, p. 381; W. Jc.

FICUS OPPOSITIFOLIA. Roxb.

Degar,—BEN. [Kolu of KURU BAKU, RAVI.]
Kaku doomoor; BEN. [Daluri, Rumali, RAVI.]

A small tree of all India. Its seeds are sown by birds, causing much destruction to houses and walls.—Roxb. iii. 561.

FICUS RELIGIOSA. Linn. Pipal tree.

Urostigma religiosum, Gasp. Medah, Vuolah,—ARAB. [Bo-gamm.].—SING. Ashwuth, —BEN. [Arasaa irritum.]
Rangittamar, —CAN. [Raya manum.]
Anti-pipal, —DUR. [Ke, Ravi, Ragi.]
Pipal,—BENG. [Awapattamum.]
Ari-sain, . . . MALEAL. [Kallaravia, . . .]

This large, handsome tree grows in most of the countries of the S.E. of Asia. It is frequently to be met with near pagodes, huts, and other buildings. One at Gyane, South Behar, is said to have been that beneath which Saky was repossing when his views as to his duties became clear to him, and if so, is more than 2400 years old. It is also held in veneration by the Hindus, because the god Vishnu is fabled to have been born under its branches. In the Somavati festival, the Mahratta women circumbulate a pipal tree, and place offerings on it, when the new moon falls on a Monday. The pipal tree is preferable for avenues to the banyan. The leaves are heart-shaped, long, pointed, wavy at the edge, not unlike those of some poplars; and as the footstools are long and slender, the leaves vibrate in the air like those of the aspen tree (Populus trinula). Silk-worms prefer the leaves next to those of the mulberry. The roots are destructive to buildings, for if once they establish themselves amongst the crevices, there is no getting rid of them. Pipal bark is deemed a decumbent tonic; the lac insects also flourish on this tree. The Chinese remove the cellular tissue or green matter of the leaves, and, covering the skeleton with a coat of varnish or gelatine, paint figures of birds, flowers, etc., on its surface. It is the most sacred of trees with the Buddhists, who say it was under this tree that Gautama slept, and dreamed that his bed was the vast earth, and the Himalaya mountains his pillow, while his left arm reached to the Eastern Ocean, his right to the Western Ocean, and his feet to the great South Sea. This dream he interpreted to mean that he would soon become a Buddha. A branch of the tree was sent to Ceylon by Asoka, and it flourishes there as the Bo Tree.—Macleou’s Tea; Mason; O’Sh.; Riddell.

FICUS ROXBURGHII. Pall. F. macrophylla, R.

Timbal,—PANJ. [Trumuel, Tirmul, PANJ.]

This small tree is found in the Sutlej valley, between Rampur and Singham, at an elevation of 5000 feet; also grows in Australia. Fruit edible, flavour pleasant; sold in bazaar of Sinda.—Claghorn, P. Rep.; Backhouse, Visit, etc.; Stewart.

FICUS RUBESCENS. Wall. F. heterophylla, Law.

Grows on the coasts of Peninsular India, and the root bark is used in medicine.
FILICIGIUM. Moon. F. diversiformis, Miq.
Man-tu, Ch., Neg-yuh, Formosan.
Mukran-tu, Ch.,——

Very common in Ceylon up to 2000 feet. Its dry, tasteless fruits are used in China for fomenting hemorrhoids. F. pumila has the same Chinese name.—Thur.; Smith.

FICUS TSIELA. Roxb.

A large and very handsome tree, generally planted by the road sides for the sake of its shade, and from its not sending down aerial roots.

FICUS VENOSA. Alt.

Grows in Ceylon, the Peninsula of India, and the Punjab. Its bark is used as a substitute for betel-nut, to chew with the betel leaf; its leaves are given as fodder to elephants. The root is used as a red dye.

FICUS VIGARTA. Roxb. F. Caricoideus, Roxb.

This grows in Hindustan and Bengal. It is wild occasionally in waste places in the plains, Cis and Trans Indus, and is not uncommon in the Himalaya to 6000 feet. It not un frequently reaches five or six feet, and Dr. Stewart noted one of more than ten in girth. The fruit is eaten by the natives, and at 5000 feet in the hills he found it excellent, though it is generally poor. Wood used for fuel and agricultural purposes.—Stewart.

FIDA. Arab., Pers., Hind. A sacrifice. Figurously meaning, one who sacrifices himself; a secret conspirator. See Kurban; Fidvi.

FIERASFER. A species of this genus of crabs, about six inches long, dwells as a parasite, within the great sea-cucumber. There are several species. The one which lives in the body of the holothuria, in its digestive tube, has a long compressed body, entirely covered with small scales; they are found in the same, along with Palemonis and Pinnotheres. It eats a portion of all that enters. Hartwig says it enters the mouth, tears the sides, and quarters itself between the stomach and the outer skin.

FIGS.

Tin, Teen, Arab. Figos, Port.

The Figus carica grows all over Spain, the Mediterranean, Italy, France, Greece, and India, and its fruit, the figs, can be had in every part of India. In Afghanistan there are two kinds, one a black fruit, which are dried and strung together and exported; the other, called Sada, are locally consumed. See Ficus carica.

FIJI, a group of islands belonging to Great Britain in the South Seas, about 1800 miles from Sydney. They extend from lat. 15° 90' to 20° 90' S. The group of 180 reef-bound islands occupy an area of 40,000 square miles. Only 40 of them are inhabited, and the population in 1863 was estimated at 200,000. The people, till the middle of the 19th century, were fierce savages and cannibals. They were then largely converted to Christianity. In 1851, 50 bodies were cooked and eaten at Nameng. In many wars, undertaken more to gratify revenge than from a desire for conquest, the slaughter of their enemies, and the obtaining the bodies for food, were objects supposed to be as honourably obtained by stratagem and every species of treachery, as by personal strength or courage. Indeed, the extent to which the thirst for blood prevailed, would be incredible, but for the undeniable testimony of many reliable witnesses. Canoes launched over the living bodies of slaves as rollers, houses built on similar foundations, the immediate massacre of all unfortunate in whom were detected the fatal sign of shipwreck, ‘salt water in the eyes,’—were practices sanctioned by their religion, the omission of which at the proper season for their performance, was sure to call down the indignation of the gods, and the punishment of the too merciful offenders, and burying alive of parents who had become burdensome to their children, and even of sickly sons by the hands of their own fathers, were events of almost daily occurrence. They discouraged early marriages, and the chastity of the young women was carefully guarded. Some at least of a chief’s wives were always strangled on the death of their husband, to accompany him to the other world, and no reluctance was ever shown by women to submit to the sacrifice; nor did young women consider the age of a man as any objection to their marriage, although fully aware that they must probably follow him to the tomb long before the natural termination of their own lives. The name and nature of their future abode differed in many of the islands, but the greater number spoke of Bulu as the place of departed spirits. They prepared and drank kava in the same manner and on the same occasions as the Polynesians. They call it Angona or Yangona, and the use of it was taught them by the Tongans.—Capt. Elphinston Erskine, Islands of the Western Pacific, p. 263.

FILICARIA MEDICINENSIS, Linn. Guinean worm. This is often about 3 feet long, and is very troublesome when it occurs about the sinews of the feet and leg. A species of Filaria inhabits the pearl oyster, and Dr. Kelart thinks it causes the formation of the pearl.

FILICARIA, or Leather Jacket, the genus Balates of the South Seas.

Filific-Aswad, black pepper, Piper nigrum.
Filific-Burree, wild pepper, fruits of Viti trilofia, annus-castus, and negundo.—Irwin.
Filific-i-Daraz, long pepper, Piper longum.
Filific-Gird, Piper nigrum.
Filific-i-Siah, black pepper.
Filific-i-Surk, cayenne pepper, red pepper.
Filific-Mueh, pepper root.
Filific-ul-Jibbel, Capparis Sinaica.
Filotof of Buddhists is the swastika or mystic cross.

Rhus decipiens, W. A. | Pahalimbar. | Singh.
FILIGREE.  

This very elegant fern-leaved tree grows in Ceylon, throughout the Western Ghat forests of the Madras Presidency, and is very abundant in the moist forests of the Animalays up to 4000 to 4500 feet elevation. The timber is strong, and valuable for building purposes; it flowers in December and January, and ripens its fruit in March. It has been introduced into gardens.—Beddome.

FILIGREE, a style of delicate wirework used for ornamenting gold and silver, introduced by the Italians, who call it Filigrana, a word compounded of Filum, a thread or wire, and Granum, a grain or bead; this is in allusion to the early practice of ornamenting the wirework with small beads. Wire used for this purpose is seldom drawn round, but flat or angular. The display of filigree work in the Great Exhibition of 1851 was very wonderful for delicacy of workmanship and fantastic beauty. The chief exhibitors were from Sardinia, Turkey, the Ionian Islands, and Malta, but the native silversmiths of Cuttack have long been noted for the fineness, neatness, and lightness of their filigree work. This kind of work is executed for the most part, under supervision, by mere boys, the whole number of boys and keener eyesight are supposed to enable them to bring out and put together the minute patterns with more distinctness and accuracy than their elders can; comparative cheapness is perhaps another reason for their employment. The ruling rates for this filigree work are from 2 to 2½ rupees; that is to say, taking the first rate, 2 rupees or 4½ is charged for every rupee weight of finished silver work, namely, 1 rupee for workmanship, and 1 rupee as the price of the silver. The filigree work in gold of Delhi and other places is famed. Next to muslins and embroidered flannelets, filigree work is that for which Dacca is most celebrated; but the art is also practised in great perfection at Cuttack, and in Sumatra and China. The articles usually made at Dacca are lady's ornaments, such as bracelets, ear-rings, brooches, chains, necklaces, etc., and attar-dans and small boxes for natties. The design best adapted for dresses is the whorl, which is supposed to represent the cope of a leaf. The apparatus used in the art is exceedingly simple, consisting merely of a few small crucibles, a piece of bamboo for a blow-pipe, small hammers for flattening the wire, and sets of forceps for intertwisting it. The drawing of silver and gold (i.e. silver covered with gold) wire, used as thread in embroidery, is extensively carried on in several places, and Beneares is celebrated for this art. There are several varieties of silver and gold thread (badia) made at Dacca, as Goolabatoon, for the embroidery of muslins and silks; Goshoo, for caps and covering the handles of chowries; Sulmah, for turbans, slippers, and hookah snakes; and Boolum, for gold lace and brocades. Some of it is drawn almost as fine as a hair. In the time of Aurangzeb, a quantity of this article was made, yearly for the court at Delhi. A boy, whose cheeks covered with it, and plain gold and silver badia to the amount of £2000 in value, appear among items composing the Mulbos khas nuzr, or present of royal clothing annually sent to the emperor. The Trichinopoly filigree work is as light and elegant as that of Malta or Genoa. Among the manifold and various manufactures of China, the gold and silver tinsel cloths of Pekin stand deservedly in high estimation; their chief value arises from the peculiar property which they possess of never tarnishing or becoming discoloured. The gold and silver filigree work of the Chinese equals any ever produced by ancient Venetian masters, and their chasing in silver is unrivalled. The art of enamelling on silver is also brought to great perfection in China, and specimens surpass any ever produced at Genoa.—Sirs's China and the Chinese, i. 387, ii. pp. 1-4; Dr. Taylor.

FINANCIAL members of the Government of India have been—James Wilson, 29th November 1859; Samuel Laing, Sir Charles E. Trevelyan, W. N. Massey, Sir Richard Temple, John Forbes, David Inglis, Sir William Muir, and Sir John Strachey, 23d December 1876, removed 1880, and Major Baring, 1881.

FINCH, a name for several genera of birds. The bull-finches are of the genus Pyrrhula, P. erythraea, P. erythrocephala, P. nipalensis, P. aurantiaca, and also of the genus Pyrrhuleuca, P. epauletta. The rose-finches, of the genera Propyrrhula, P. subhemenachala, Carpodacus rubii, P. coerulea, C. erythrinus, P. coeruleus, P. spuria, P. rhodochlamya, P. rhodochrous, P. pulcherrimus, P. frontalis, P. Murrayi, P. nipalensis, and P. juniceps, with Callcanthiis Burtoni, and the gold-finches of the Himalaya, Carduelis caniceps; also Metoponia pusilla, with species of Fringilla montifringilla and Fringillidae nemoriciola. The Himalayan gold-finch (Carduelis caniceps) at first sight bears a striking resemblance to the European species, but differs in wanting the black on the head. The pretty little red-fronted finch (Metoponia pusilla, Pall.) is a tenant of waste places, and usually seen singly or in small flocks, feeding on the seeds of a species of wormwood, on which gold-finches, house-sparrows, and one or other of the roseate grosbeaks also feed. This finch is easily recognised by its small size, a red spot on the forehead, and yellowish-brown on the upper parts; the females and young are darker in plumage. The consequence is it is in great request as a cage bird in the Panjaban, to which it is brought from Afghanistan.

FINGER-NAILS are allowed by Buddhist devotees of China to grow to a great length.

FINJAN. ARAB. A cup without handles.

FINN, a race occupying Finland in the north of Europe, supposed to be of the same stock with the Turkoman, the Chude, the Laplander, and the Magyar of Hungary. Rask was of opinion that the language of the Lap, the Finn, and Basque of Europe, and of the Cucuwhuri, Kohati, Toda, Gond, and Lar of India, also the Brahui and the Japanese, were of one stock.

It is generally supposed that the original seat of the Finnic tribes was in the Ural mountain, and their languages have been therefore called Uralic. From this centre they spread east and west and southward in ancient times, even to the Black Sea, where Finnic tribes, together with Mongolic and Turkic, were probably known to the Greeks under the comprehensive and convenient name of Seychiana. On the evidence of language, the Finnic stock is divided into four branches, the Chudic, Bulgaric, Permic, and Ugric.
The Chudic branch comprises the Finnic of the Baltic coasts. The name is derived from Chud (Tchud), originally applied by the Russians to the Finnic nations in the north-west of Russia. Afterwards it took a more general sense, and was used almost synonymously with Sclavon for all the tribes of Central and Northern Asia. The Finns properly so called, or, as they call themselves, Suomalaisten, i.e. inhabitants of fens, are settled in the provinces of Finland (formerly belonging to Sweden, but since 1809 annexed to Russia), and in parts of the governments of Archangel and Olonetz. Their number is estimated at 1,521,615. The Finnic are divided into three main dialects, and arc, the Magyars excepted, the only Finn race that can claim a station among the civilized and civilizing nations of the world. Karelians and Tavastian are dialectical varieties of Finnish. The Eeth or Esthonian, neighbours to the Finn, speak a language closely allied to the Finnish. It is divided into the dialects of Dorpat (in Livonia) and Reval. Except some popular songs, it is almost without literature. Estonia, together with Livonia and Kurland, forms the three Baltic provinces of Russia. The population on the islands of the Gulf of Finland is mostly Estonian. In the higher ranks of society Estonian is hardly understood, and never spoken. Besides the Finn and Estonian, the Livonian and the Lapp must be reckoned also amongst the same family. Their number, however, is small. The population of Livonia consists chiefly of Vets, Letts, Russians, and Germans. The Lapp inhabit the most northern part of Europe. They belong to Sweden and Russia.

The Bulgarian branch comprises the Tchernomians and Mordvinians, scattered in disconnected colonies along the Volga, and surrounded by Russian and Tartaric dialects. The general name given to these tribes, Bulgarian, is not borrowed from Bulgaria on the Danube; Bulgaria, on the contrary, received its name (replacing Moesia) from the Finnic armies by whom it was conquered in the 7th century. Bulgarian tribes advanced from the Volga to the Don, and, after remaining for a time under the sovereignty of the Avars on the Don and Dnieper, they advanced to the Danube in 635, and founded the Bulgarian kingdom.

The third, or Permic branch, comprises the idioms of the Votians, the Sirianes, and the Permians, three dialects of one language. Perm was the ancient name for the country between long. 61° 76' E., and lat. 55° 55' N. The Permic tribes were driven westward by their eastern neighbours, the Voguls, and thus pressed upon their western neighbours, the Bulgar of the Volga. The Vostiaks are found between the rivers Vyatska and Kama. Northwards follow the Sirianes, inhabiting the country on the Upper Kama, while the eastern portion is held by the Permians. These are surrounded on the south by the Tartars of Orenburg and the Bashkir, on the north by the Samoyedes, and on the east by Voguls, who pressed on them from the Ural.

The Voguls, together with Hungarians and Ostiaks, form the Finno-Ugric and last branch of the Finnic family, the Ugric. It was in 462, after the dismemberment of Attila's Hunnic empire, that these Ugric tribes approached Europe. They were then called Onagur, Saregur, and Urog; and in later times they occur in Russian chronicles as Ugry. They are the ancestors of the Hungarians, and should not be confounded with the Uigur, an ancient Turke tribe.

FINOKI. JAP. A cypress tree of Japan, which yields a light whitish wood of a good substance, and does not absorb water.—Smith.

FIR. Sung-shu, Chin. The fir tree is met with on most of the hills of China, and its wood is used in carpentry and for fuel.—Smith.

FIRDUSI, author of the Shah Namah, a Persian poem, was born at Kirwan, near Taos, in about 940, and died there 1020. He wrote it at the request of Mahmud of Ghazni; but disappointed of the promised reward of 30,000 drachmas, he returned to Toos, his native city, and there died. A little way from the gate of the entrance of Toos there stands a dome ornamented with laquered tiles, so small as seemingly to form a part of some private house. The dome covers the dust of this celebrated poet, who, after the treatment he received from Mahmud, retired there to die (Fraser's Khurasan, p. 519). Mahmud was not, however, a niggard in his rewards of the learned, and had sent the money after Firdusi, but he had died before it arrived. The Shah Namah relates to three heroes, Jamshid, Faridun, and Garshasp, as the earliest representatives of the generations of mankind. In his satirical description of Mahmud's court at Ghazni, he says he has had enough of plunging after plunging into it, and would fain rest while from ducking into a sea without bottom and shore in which he has fished long but has not found any pearl. Firdusi is the first of the epic poets of Persia, and few countries can boast of a greater genius. His chief work, the Shah Namah, or Book of Kings, contains, mixed with allegory and fable, almost all the Persians know of their ancient history. It contains 120,000 verses.
the poita, and never suffers it to go out, using the same fire at his wedding, and in all his burnt-offerings, till a length, after his death, his body is burnt with it. The sacred fire kindled by Moutezuma was preserved by Pocs down to our own times. The Natches of N. America preserved a sacred fire, and believed that frightful calamities would ensue if ever the fire were extinguished at both temples at once. Even among Christians of the present day, according to Mr. Robertson, on the eve of the Greek Easter-day, the ceremony of receiving the αυξω-τις or holy fire is performed in the chapel at Jerusalem. The fire burns from the sepulchre, and the pilgrims of the Greek communion light their torches at it, believing that they receive it from heaven. The lamps and candles which some Christian sects keep in their churches are remnants of the ancient and modern culture of fire. The Athenians had a perpetual fire kept by widows; among the Romans it was kept by virgins. The Greeks had one in the temple of Apollo. The Chaldeans adored fire; and when it went out, it was a presage of all sorts of misfortunes to the state.

In the Hebrew books, the Supreme is mentioned as having appeared in fire or encompassed with this element. When he showed himself in the burning bush, and descended on Mount Sinai in the midst of flames, thunder, and lightning (Exodus iii. 2, xix. 18). Fire is also a symbol of the deity (Deuteronomy iv. 24). In this awful manner he showed himself to Isaiah (ch. vi. 4); to Ezekiel (ch. i. 4). The Psalmist describes the chariot of God as composed of flames (Psalm xviii. 12-14). And the second coming of Christ is represented as in the midst of consuming fire (2 Thessalonians i. 8; see also Daniel vii. 10). The wrath of God is compared to fire (Psalm xviii. 8); and so are those effects of his displeasure, famine, war, and pestilence (Psalm lxvi. 12; Jer. xxi. 12). To this element the Lord is compared (Malachi iii. 2), referring to his judgment upon the wicked who are consumed like the dross of metals, and to the effects of his grace refining the righteous like pure gold. The influences of the Holy Ghost are also compared to fire (Malachi iii. 11), in reference to the tongues or flames of fire that rested on the heads of the apostles (Acts ii. 3), and to the work of regeneration on the human soul, illuminating, quickening, purifying, and inflaming with gratitude, love, and zeal. The angels of God are represented under the emblem of fire (Psalm civ. 4); and a column of flame directed the marches of the Israelitish camp during the night seasons in the wilderness (Exodus xiii. 21). Fire anciently fell from heaven to consume the victims sacrificed to the Lord, and this was an indication of his regard and approbation. And this is thought to be the manner in which Jehovah signified his acceptance of Abel's sacrifice. Fire also fell upon the offering made by Moses (Leviticus ii. 4), on those of Manoah (Judges xi. 29, 30), on Solomon's (2 Chronicles vii. 1), and on Elijah's (1 Kings xix. 18, 39). The fire which descended from heaven, first upon the altar constructed by Moses in the tabernacle, and again on that erected by Solomon at its consecration, was constantly fed and preserved by the priests, and was regarded as celestial or hallowed fire, first kindled by the Lord himself, to instruct mankind that the origin of all

spiritual good is from above, and that we are not to warm ourselves with the sparks of our own kindling.

What kind of fire is meant by the 'strange fire' of Leviticus x. 1, Numbers iii. 4, xxvi. 61 (see also Leviticus vii. 7, ix. 11, 24, and Exodus xxx. 9), is doubtful; but a Brahman should maintain three fires (Vikrama and Uravasi; Introduction, i. p. 190), two mentioned in a saka or the Rig Veda and the Apastamba Sutra, are the Sabha and Avasathy, the precise purport of which names is not known to the pandits, nor explained in the Baalha. The literal sense would be the fire of the assembly and the fire of the village, as if a sacrificial fire was sometimes maintained in common.

The subdivision of one fire into the three fires of the Hindu ritualistic worship is ascribed by the Mahabharata, and the rest to Pururavas. The commentator on the former specifies them as the Garapatyia, Dakshina, and Ahavaniya, which Sir William Jones (Manu. ii. p. 231) renders nuptial, ceremonial, and sacrificial fires; or rather—(1) household, which is perpetually maintained by a householder; (2) a fire for sacrifices of others, and for the religious (3) a consecrated fire for oblations,形成ing the Tretagni, or triad of sacred fires, in opposition to the Laulika, or merely temporal ones.

It may be that the taking of fire from other than the established place was called 'strange.' Fire used by Hindus for the funeral pile ought to be obtained from the sacred fire, but it is at present the common practice of the Hindus of ordinary rank in the Western Provinces of India to procure fire from an out-caste to light the funeral pile. On the eastern side of India, the fire used in the household sacrifices of their homes is obtained from the hearth fire. That used in their inceneration is from the lamp lit in the ceremonial when a person is moribund; but the lamps of the temples are lit only by Brahmins, and taking fire from other than the altar would be 'strange.' A Hindu, as indeed also a Mahomedan, does not blow with his mouth, or the deceased, when the breath, the Hindu believing that a deity intervenes. In the whole of Central and Southern Asia, and with Hindus, Parsees, and Mahomedans, to blow out a light is considered very wrong.

On the east side of the fortress of Gwalior, where myriads of warriors have fattened the soil, phosphorescent lights at one time often appeared. They are termed Shahaba by the Rajputs, perhaps from the Arabic shahab, a meteor. Colonel Tod dared as bold a Rajput as ever lived to approach them; but he replied, men he would encounter, but not the spirits of those erst slain in battle. Such fires the northern nations believed to issue from the tombs of their heroes, and to guard their ashes; they called them Hauja Eldir, or the sepulchral fires, and they were supposed more especially to surround tombs which contained hidden treasures. When the intrepid Scandinavian maiden observes that she is not afraid of the flame burning her, she is bolder than that bold Rajput, for Sri-Kishen, who, as above related, was shocked at the bare idea of going near the sepulchral lights, was one of three non-commissioned officers who afterwards led thirty-two firelocks to the attack and defeat of 1500 Pindaris. At present the Kasak or Kirghiz do
not spit on a fire; and in Khiva, Khokand, in many other parts of Africa and Asia and Europe, the custom continues of dancing round fire. Everywhere with the Hindus there is believed to be a fire which does not burn a person, attributed to Siva the Mahadeva, written also Sek or Sin; and annually, in the Dehkan, the fire-worship of Mahadeva is performed, in which the devotees run or jump through great fires, attributing their escape to the interposition of that Hindu deity. In the North Aroet district of the Madras Presidency, a fire festival custom prevails annually, in which the people walk through fire, but accidents occur, ending in death.

Abul Ghazi relates that he allowed his wives before their confinement to pour grease on to the fire, to guess from the splutterings of the flame whether they would have boys or girls. This superstition is still practised in Central Asia, and finds its counterpart in the melting of wax or lead by European girls on New Year's Eve, to see from the shapes into which it runs whether they will be married in the course of the year (Vambbery, Bokhara, p. 283). So the Kirghiz, though professing Mahomedanism, threw grease on their fires. They and the people of Wakhân and Badakhshan dislike blowing out a light. Spiegel asserts, in an article which appeared in the Ausland under the title Das östliche Turkistan, that in the 7th century after Christ, Turkish tribes in the north of the Tien-shan were fire-worshippers.

Fire is produced from several woods by friction. In India, from the Isora corhyloïda; in New Zealand, by friction of the woods of the Myhoe or Melicytus, members of the Araucaria family; and of the Kaimakmo trees. The wood used to provide fire in Tahiti is that of the Hibiscus tilicinus, which is also used for shoulder-poles and outriggers for steadying a canoe. Its blunt point is rubbed in a groove till the dust takes fire. Fire is kindled in the Sandwich Islands by twirling a sharp-pointed bit of wood over a small slab. The Aaleutians manage the upright stick with a string in the manner of a gimlet or borer. They also rub sulphur on two stones, and strike fire from thereon by means of a sulphur with sulphur (Kotzebue's Voyage, iii. p. 259, in Jam. Ed. Journ. vi.). The Guacho of the Pampas takes an elastic stick about 15 inches long, and presses one end against the breast, the other in a hole in the piece of wood, and then rapidly turns the curved point like a carpenter's centre - bit. — Wilson's Hindu Theatre; The Toy Cart; Art. p. 112; G. Bennett, p. 418; Colebrooke on the Religious Ceremonies of the Hindus, Asiatic Res. xxi. p. 241; Somner's Voyage, pp. 77, 78; Story of Nala, p. 102; Robinson's Travels, Palestine and Syria, i. p. 282.

FIREBACKS, species of the Gallus partridge.

FIRE-CLAY. Sang-i-dalam, Hind. A kind of clay, very common in many parts of India, from which bricks can be made that resist the action of great heat.

FIREFLY, little luminous insects, species of Lampyris and Elater. The lower part of the body has some apparatus for emitting a bright phosphorescent light. Usually it is emitted in flashes at intervals of a second, and it is interesting to guess where the creature in its flight will next show itself. But occasionally the light is continuous.

FIREWOOD.

As fade the upper skies,
Each thickest opes ten thousand eyes,
Before, beside us, and above,
The firefly lights his lamp of love,
Retreating, changing, Mahan, swooning,
The darkness of the cope explore.

Fulgura candelaria is the Chinese firefly. F. lanterna is another. The Elater beetles have over 70 species in tropical America. E. noctiluca occurs in India.—Heber, i. p. 247. See Agiolepas; Insects; Lampyrids.

FIREPLACES, in the eastern and southern parts of Asia, are usually the hearths alluded to in Jeremiah xxxvi. 22: 'There was a fire on the hearth burning before him.' Hindu houses have neither chimneys nor fireplaces. In the cold weather, the rich burn wood in brass or earthen pans, placed in any part of the room; the indigent burn sticks on the floor. The hearth or fireplace is commonly taken to mean the livelihood, or means of supporting a family. If the family be scattered into, say, three parties, the expression would be, 'I have three fireplaces burning.' Speaking of lead frequently rubbed and dispersed, the Persians say, 'Ojoak-isban koor shaud.' Their fireplace is darkened; and the people of India say, 'Ghar men chahin nahn.' The house is without a lamp; also 'Chulay men ag nahn,' 'There is no fire on the hearth.'

FIRE TEMPLE, the name usually applied to the places of worship of the Parsee religiousists. Their Hormusjee Wadia fire temple in Bombay was established about A.D. 1839; the Nowarsee, A.D. 1763; the Surat, in A.D. 1822; the Oodwar, A.D. 873—it is the oldest. An annual service is held in a morning of the beginning of November. In the evening the Parsee streets in the Bombay Fort and the Bazar Gate street are illuminated, and flags and evergreens adorn the principal entrances.

FIREWOOD.

Bois de chauffage, Fr. Lakri, Hind.
Bremskohle, Gen. Lena para el fuego, Sr.

Firewood is the chief fuel used in the E. Indies, and the less valuable trees of each locality are cut. On the east coast of the Peninsula the fuel woods are—

Canthium parviflorum. Randia dumetorum.
Hymenodactyllum exsalvum. Anisonea multiflora.
Acacia speciosa. Cassia auriculata.
Gmelina asiatica. Phyllanthus sp.
Feldonandra. Acacia leucophiea.
Vates lacertan. Morea buxifolia.
Grewia rotundifolia. Dichrostachys cinerea.

The fuel trees at Simla are chiefly—

Quercus incana. Pinus exelsa.
Rhododendron arboreum. Cedrus deodara.
Andromeda ovalifolia.

with other jungle trees and stout underwood. At Kussowlee and Kanawar, the contractors supply principally 'chir' (Pinus longiloba), which grows wild on the adjoining hill-sides, and splits easily. The only forbidden wood is 'beuhl' (Grewia oppositifolia), which emits an offensive smell in burning. The villagers use as fuel the withered stems of Euphorbia pentagona and thorny bushes.

In the Punjab, the woods used are—

Alstone, sp. Hippophae rhamnoides.
Artemisia sacrorum. Juniperus communis.
Calligonum polymorphides. Juniperus excelsus.
Cangana pygmaea. Periploca aphylla.
Cressophora tinctoria. Rhaiza stricta.
Ephedra Gerardiana. Resa Webbiana.
Eurodia ceratoides. Tanacetum tomentosum.
FIREWORKS.

Near the Panjab railway lines, Phulai (Acacia modesta) furnishes a hard wood, which is perhaps the best fuel given by any wild tree. It is only found in quantity near Amritsar and Jullundur. Jhand or kandi (Prosopis.spicigera) covers very large areas in the central tract near Lahore, and grows more partially over many parts to the south. Its wood is open-grained and softish, and is very subject to the attacks of white ants; but it furnishes a fair fuel, and has been the chief source of supply for the locomotives in the Panjab. Next to it, as to quantity of fuel furnished, come the tamarkises, furnas, lei, pilchi, etc. (Tamarix orientalis and T. Indica), which, from some miles south of Lahore, cover hundreds of square miles of the low land. A kikar or sisoo tree, under tolerably favourable circumstances, attains a girth of about 30 inches in ten years, and gives about 4 maunds (328 lbs.) of dry fuel. 200 trees yielding 800 maunds (65,600 lbs.) of dry fuel might be grown on an acre in ten years. Various species of Salsalocce are abundant in the more saline parts of the Doabs of the Panjab. West of the Beas, Karil, the Capparis aphylla, a considerable shrub, is a common brick fuel in many places in the Panjab; as also is the jal, wan, or pilu, Salvadoria oleoides over-abundant south of Lahore. Along some of the rivers in the south the bahn (Populus Euphratica) is not uncommon, but its wood is very light. The smaller tamarkis, T. Indica, becomes fit for felling in eight or ten years. For the fuel of the Indus steamboats on the Delta, the mangrove is used.

FIREWORKS.

Feux de artifices, FRI. Marchun, Rabok, MALAY. Feuerwerke, GER. Fucso artificiale. Attilhazes, GUI., HIND. Fuegos artificiales.

In Eastern countries the people have superb displays of pyrotechnic skill. The fireworks are of various forms, represent animate and inanimate things, such as trees, tigers, ships, elephants, men, sea-fights, eclipses of the sun and moon. They are manufactured in the principal cities. Green fire is produced by green baryta, chloride of potash, and sulphur; red fire from strontia, chloride of potash, sulphur, and charcoal; blue fire from chloride of potash and sulphur. Fireworks imported into India in the years 1874-5 to 1879-80 ranged in value about 3 to 5 lakhs. The natives of India are passionately fond of fireworks, and at marriages and other important festivals they gratify their taste.

FIROZAH, Turks, or the Turquoise. Firoz-rang, turquoise blue. This mineral is found at Khajood, in Mawar-u-Nahr or Transoxiana, at Shebavek, in Kirman, and in a mountain of Azerbaijan, where the mine was discovered before Ahmad bin Abd al Aziz composed his Tattiseri on Gems. He describes the mine at Nishapur as most celebrated from early ages for that particular kind of turquoise entitled Abu Isahi, which, says he, averts evil from those who wear it, conciliates the favour of princes, augments wealth possessed, repels the sight of enemies, vitiates an adversary, and banishes all unpleasant dreams. The ancient sages, when first they beheld a new moon, immediately after fixed their eyes, says he, on the fire-bash. — Ouseley's Travels, p. i. 211.

FIROZ KOHI, an Aimak tribe from the town of that name, 63 miles from Teheran. They are of Persian origin, and their forefathers fought Timur bravely when that conqueror subjugated their country. After they were driven by him into the mountains south of Mazenderan, they there defended themselves more desperately; but they were eventually defeated and carried by him into Herat.—Ferrier, Journ. p. 196. See Aimak.

FIROZPUR, a town and military cantonment in the Firozpur district of the Panjab, situated in lat. 30° 50' 42" N., and long. 74° 38' 24" E. The revenue district is between lat. 30° 8' and 31° 11' N., and between long. 74° 3' 30" and 75° 7' E.; area (1878), 2,739 square miles; population in 1868, 549,253. The Dogra and Bhatti form the leading Rajput tribes, and bear the reputation of being lazy and thriftless. — Imp. Gaz.

FIROZ SHAH, emperor of Delhi. He wrote an account of the occurrences of his reign, and called it Futuhat-i-Firoz Shahi.

FIROZ-u-DIN TAGHALAQ ascended the throne of Delhi a.d. 1351, and died at the age of ninety, on the 23rd October 1388. He was just and liberal-minded, erected many (700) public works, some of which still remain, amongst others an irrigation canal from the Jumna where it leaves the mountains, to Karsal to Hanni and Hissar. It reaches to the river Ganges, and in former times was connected with the Sutlej, the nearest river in the Panjab. The British restored 200 miles of it to beyond Hissar. Ferishta relates that he obtained acquaintances from the relatives of all who had suffered from the violence of his uncle, Muhammad Taghalag (A.D. 1325-51), and deposited the sealed acquittance in his uncle's tomb. —Elph. India, p. 556; Tr. of a Hind. ii. p. 216.

FISHES. OF THE South and East of Asia.

Samkat, ARAB. Pices, LAT. Angana, BURM. Ikan, MALAY. Pish, DAN. SW., MAHI, PERS. Vissenchen, DUT. Rybi, POLISH. Poisson, FRI. Flexos, PORT. Fisch, GER. Rub, RUS. Ichthus, GR. Pesados, SP. Dag, HERB. Min, TAN. Matchhi, MAT. Hansi, CHAPU, TEL. Pece, IR.

During the 18th and 19th centuries, this branch of the natural history of the East Indies has received the attention of many learned zoologists. Bloch, in 1785, published his splendid work on Auslandische Fische. This and his Ichthyology, and the continuation of the latter by Schneider, contain many Indian forms, as does Lacépédès Histoire des Poissons, 1798-1803. In 1808 there appeared Dr. Patrick Russell's book in two volumes, containing descriptions and figures of 200 fishes collected at Vizagapatam on the coast of Coromandel. In 1822, in a 4to volume, Dr. Hamilton gave an account of 266 fishes found in the river Ganges and its branches, with a volume of plates. The voluminous work by Baron Cuvier and M. Valenciennes, Histoire Naturelle des Poissons, published in Paris in 1828 and following years, was of great value to science. A beautiful volume of much more importance, the Fauna Japonica, was published in 1847 by MM. Ph. Fr. de Sibole, C. J. Temminck, H. Schlegel, and W. de Haan, Lugduni Batavorum 1847. In 1841 there was issued at Berlin the Systematische Beschreibung der Plagiostomen by Dr. J. Müller and Dr. J. Henle, which included many of the genera and species of the seas in the S. and E. of Asia. Dr. McClleland of the Bengal Army, in 1842, in the
Fishes.

Calcutta Journal of Natural History, described the fresh-water fishes which Dr. Griffiths had collected; and subsequently, in 1843, he described a collection made at Chusan and Ningpo. In 1834 Mr. J. W. Bennett published a Selection of Rare and Curious Fishes found on the Coast of Ceylon. Dr. Ruppell in 1828 and Peters in 1868 described the fishes of the Red Sea and those found southwards to Mozambique; and the fishes near the Cape were described by Dr. Smith. Dr. Day, in 1865, published his Fishes of Malabar, the new species in which were lodged in the British Museum. The fishes of China and Japan were described by Sir John Richardson in the Report of the British Association in 1845. Dr. M'Clelland published a memoir on the Indian Cyprinidae in the As. Res. xix. p. 217. Colonel Sykes wrote on the Fishes of the Dekham in the Transactions of the Zoological Society in 1841. Fishes aus Casimir were described by MM. von Hugel and Heckel in 1838. Dr. Kelart of Ceylon paid much attention to the ichthyology of the island. Dr. Theodore Cantor in 1850 furnished, in the Bengal Asiatic Society’s Journal, a minute account of 292 fishes of the Malay Archipelago. From 1845 to 1860 Dr. P. Bleeker, in numerous contributions on the fishes of the Eastern Archipelago, added greatly to the stock of knowledge of the seas of the region from Penang to Japan. Mr. E. Blyth, long the Curator of the Bengal Asiatic Society’s Museum, from time to time published in the Bengal Asiatic Society Journal, notices of fish; and T. C. Jordan, a medical officer in the Madras Madras’s Literary Society’s Journal, gave several contributions on the fresh-water and on the salt-water fishes of the Peninsula. Dr. A. Günther, in addition to all that he had written in the Proceedings of the Zoological Society and other journals, in the years 1859 to 1870 brought out eight volumes of a catalogue of the fishes in the collection of the British Museum; and in 1866, conjointly with Lient.-Colonel L. Playfair, published an illustrated volume on the Fishes of Zanzibar, the Seychelles, and Chagos Islands. Dr. Kullenzinger, in 1870-1871, published a detailed account of the Fische des Rothen Meeres. Later still, Dr. Day has written (1875-77) an invaluable work on the Fishes of India, Ceylon, and Burma, with many monographs and numerous reports on the sea and fresh-water fishes and fisheries of India. The scientific arrangement of this branch of Natural History is as follows:

- **SUB-CLASS, TELEOSTEI**. Order, Acanthopterygi.  
**Fam. Percidae.** Gen. lates, serranus, grammistes, diplotropis, genyogryoe, mesopiscis, myriodon, ambassia, agonon, agonichthyes, chelidopterius, dules.  
**Fam. Trisiptidomias.** Gen. therapon, pristipomis, -diagramma, lobedes, datniodes, germis, scolopsia, dentes, amaris, cesio.  
**Fam. Squamipinnes.** Gen. chartodon, toxotes, chelmo, homclinos, holacanthos, scaphophus, episcus, maculata.  
**Fam. Nandidae.** Gen. plesios, baldis, manudis, cateora.  
**Fam. Mullidae.** Gen. upeneodes, sollosilus, upenes.  
**Fam. Sparidae.** Gen. crenidens, sargus, lethrinus, sphyromus, pagrus, chrysophus, pimelopeterus.  
**Fam. Caridid.** Gen. cirichreas, cirichreus, cirichrhis, milatrus.  
**Fam. Scorpenidae.** Gen. scorpoas, sabuster, pterois, apasists, amphiospinchthyes.  
**Fam. Teuthidide.** Gen. teuthis.  
**Fam. Berycidae.** Gen. myriohtis, holocentrum.  
**Fam. Kurididae.** Gen. kurtus, permorrh.  
**Fam. Polynemidae.** Gen. polynemus.  
**Fam. Seicicidae.** Gen. umbrinus, sciema, ootolthus, scicinoides.  
**Fam. Xiphidae.** Gen. histiophorus.  
**Fam. Tetrodidae.** Gen. trichiricus.  
**Fam. Anacanthidae.** Gen. anacanthus, nasus.  
**Fam. Carangidae.** Gen. caranx, serlora, serilichthyes, nancrates, chacrinus, trachynotus, pectus, platas, pseus, equula, ganna, lactans.  
**Fam. Scortichidae.** Gen. stromateus.  
**Fam. Coryphaenidae.** Gen. coryphana, mene.  
**Fam. Nomeidae.** Gen. cucips.  
**Fam. Scombroidae.** Gen. scomber, thynnus, cybium archipelicum.  
**Fam. Uranoscopidae.** Gen. uranoscopus, icthysocopus.  
**Fam. Trachinidae.** Gen. percis, sallago.  
**Fam. Pseudochromides.** Gen. opisthognathus, pseudopiles.  
**Fam. Batrachid.** Gen. batracius.  
**Fam. Pediculost.** Gen. antornarius.  
**Fam. Cortidae.** Gen. synancium, synanoecis, minuos, pelor, chorismactys, polycellea, platychcephalus.  
**Fam. Cataphracti.** Gen. dactylopterus, pegasus.  
**Fam. Gobid.** Gen. gobitis, apgochryncisthi, scydrom, gobiodon, pergophostium, bongolephalum, electris, amblyopus, trypanch.  
**Fam. Callionymidae.** Gen. callionymus.  
**Fam. Pogonip.** Gen. ecpola.  
**Fam. Blemniidae.** Gen. blemius, salarids, anandria, petroziscrtes, tripterigium, xiphias.  
**Fam. Sphynidae.** Gen. sphyrena.  
**Fam. Atherinidae.** Gen. atherina.  
**Fam. Mugilid.** Gen. mugilis.  
**Fam. Aulostomatidae.** Gen. fustarlis.  
**Fam. Centriscidae.** Gen. amphiolis.  
**Fam. Trachyrhincidae.** Gen. regaleus.  
**Fam. Pomacentrade.** Gen. amphilonga, premmas, dasylus, pomacentrus, phylidodon, halistes.  
**Fam. Labridae.** Gen. labrichthyes, labroides, chelinius, eubulbus, anamayes, hemigymmus, stethojulis, platygnous, novacul, julis, gymnothunnus, coris, cymolutes, pseudolode, calyodon, pseudoscarus, chersones, bato, chelius, scarabys.  
**Fam. Labirynthici.** Gen. anabas, palaecotus, osphromenus, trichogaster.  
**Fam. Orthopoeichphalide.** Gen. orthopoeichphalus, channa.  
**Fam. Brynchoebolide.** Gen. brynchoebolus, macrourus.  
**Fam. Chromides.** Gen. etropus.  

ORDER, Anacanthini. **SUB-ORDER, Anacanthi-Gadoidii.**  
**Fam. Gadidae.** Gen. bregmaceros.  
**Fam. Ophidiide.** Gen. brotulus, Blekeria.  

**SUB-ORDER, Anacanthi-Pleuronectoidii.**  
**Fam. Pleuronectide.** Gen. pastodes, pseudorhombus, platophysis, heterosomata, solea, achirus, synaptura, plagius, cynoglossus.  

**ORDER, Phoxostomi.**  
**Fam. Siluride.**  

- **SUB-Fam. Silurinae.** Gen. macrones, arias, bata-choephalus, ketogens, osteogenius, plotosus, akyias, creitesius, rita, pangians, pseudetropius, callichrous, wallago, olya, silurus, chaca.  
- **SUB-Fam. Ambylocephine.** Gen. clarias, saccobranchus, silandia, allia, allichrous, eutrophichthyes, idor, eugnathiun, helodolus, bagarius, pseudocheniseis, glyptosternum, ambloeyes, exostoma.  
- **Fam. Cypridinide.**  

- **SUB-Fam. Cyprininae.** Gen. poecilobrychus, Meyara, microgastres, creius, schizothorax, laboe, osteo-choilus, ehirrana, scaphocephal, carbassius, sempliotes, cilia, mole, barbua, urria, aspartepia, rochtan, barbius, abrius, porlaimalois, ophiuro.  
- **SUB-Fam. Homalopterini.** Gen. homaloptera.  
- **SUB-Fam. Cobitini.** Gen. apua, anacanthophthalmus, anacanthis, eobiti, lepischoephalchthyes, ottis, lophathyphus, lebopsho.  
- **Fam. Scopelidae.** Gen. saurus, saurida, harpodon.  
- **Fam. Scrobireocde.** Gen. belone, hemiramphus, exocetus.  
- **Fam. Pseudeulpeidae.** Gen. chanos, cles.

### FISHES.

**Fam. Clupeidae.** Gen. chironotus, clupea, coilia, chatria, dasuamia, engraulis, ophistomerus, pellona, roncalis, scarplideus, corvis, megalops.

**Fam. Notopteridae.** Gen. notopterus.

**Fam. Symbranchidae.** Gen. monopterus, amphignon, symbranchus.

**Fam. Murcenses.** Gen. murcanesox, murcanichthys, ophichthyis, anguilla, moringus, murana, gymnumura.

ORDER, Lophobranchi.

**Fam. Syngnathidae.** Gen. syngnathus, nephos, gasteroopen, acenotrum, ichtyocampus, dory-ichthys, hippocampus.

ORDER, Pectoralia.

**Fam. Gymnothidae.** Gen. xenopterus, tetron, troton, dioton.

**Fam. Scoradermi.** Gen. triacanthus, balistes, monacanthus, ostracon.

**SUB-CLAS, CHONDROPTERYGI.**

ORDER, Plagiostoma. SUB-ORDER, Selachoidel, or Sharks.

**Fam. Carchariidae.** Gen. carcharias, galeocero, zygana, mustelus.

**Fam. Scylliidae.** Gen. scyllium, stegotoma, chlo- scyllium.

**SUB-ORDER, Batoidel, or Rays.**

**Fam. Pristidae.** Gen. pristis.

**Fam. Rhinidae.** Gen. muraenops, rhinobatus, sphyrodon, muraenops.

**Fam. Torpedinidae.** Gen. narce, astrape.

**Fam. Rajidae.** Gen. platyponia.

**Fam. Trygonidae.** Gen. trygon, urogymnus, pteropleur.

**Fam. Melobatidae.** Gen. melobates, notobatis, rhino- ptera, dicerosbat.

From the continuity of the waters from the Red Sea and east coast of Africa, through the Indian Ocean and Bay of Bengal, into the seas of the Archipelago, around Australia and into the Pacific and Polynesia, it is probable that many of the fishes which are now only known as inhabiting a particular sea, will be found throughout that line of ocean, and that the great natural barriers will be found to be Cape Horn and the Cape of Good Hope on the south, to pass either of which capes would throw the fish of the tropical seas into cold regions.

The fishes chiefly used as food in the fresh waters of India, belong to the order Physostomia, especially those of the Cyprinidae, and herring families, as also those classified in the spiny-rayed or Acanthopterygii order. Mahomedans in Sind eat silurids; but in general the silurid, or scaleless fishes, as sharks, skates, rays, eels, are not eaten by Mahomedans or Jews. They are very foul feeders. All the spiny-rayed or acanthopterygian fishes found in India are good for food. Of the silurid fishes, the Magur or Singi (Saccobranchus), and many others, and the carps (Cyprinidae), are all useful for food. The herring family (Clupeidae) are all good, and eels are reckoned wholesome, though natives of India refuse them.

The Andamaners eat the tetrodon, and the Burmese eat the large yellow Xonespernus maritus; others of these genera are deemed poisonous.

The fecundity of fishes is very various. In a hilsa fish, 1,029,645 eggs have been counted; in a migratory barbel, 410,500 eggs. The monogamous non-migratory fish appear to breed frequently, and they protect their offspring. In the Cirrhina reba, H. B., a polygamous non-migratory carp, Dr. Day found 41,500 eggs; and in a silurid, Callichrous canio, H. B., 47,444; whilst a monogamous walking-fish or ophiocephalus had only 4700. The striated walking-fish breeds twice a year, in December and June. The male constructs a nest with its tail amongst the vegetation, and by biting off the ends of the weeds that grow in the water. Here the eggs are deposited, the male keeping guard; but should he be killed or captured, the nest is taken by his partner. The parents are very fierce in this time, and defend their offspring with great courage.

Dr. Day tells us of vast shoals of some forms of fishes approaching the shores or shallows of the Indian coasts at certain seasons, mostly for breeding purposes, and these are often destitute of means of defence, becoming food for their stronger neighbours, or are captured by man for consumption. He arranges the Indian fishes, in their economic relations, into three classes,—First, the more strictly predaceous forms, which are more or less migratory in their habits, generally in order to follow and prey upon their weaker neighbours; some of these congregate in shoals, while others lead more solitary lives. Secondly, non-migratory fishes, some of which are likewise predaceous. These usually reside along the shores and backwaters, being almost confined to the littoral zone, although a few may extend their range into brackish waters on the inshore land, or into the deep sea on the other. Thirdly, those which are more preyed upon than predaceous, consisting of such as live in large assemblages, being gregarious in their habits, and others which lead a more solitary existence.

Among the first, or predaceous division of marine fishes, are some gregarious forms, but such are scarcely so numerous or well fitted for destroying their neighbours as those which are more solitary in their habits. Their best-known representatives are found in the spiny-rayed or acanthopterygian order, or else among the cartilaginous or chondropterygian fishes. Some attain to a great size. Thus, Dr. Cantor alludes to a sea perch (Serranus) exceeding 130 lbs.; and Dr. Russell to another, which was 7 feet long, 5 feet in girth, and upwards of 300 lbs. in weight. Nearly allied are the Lotusian or Messopontus, which, although not the largest, are the most formidable to man, owing to their being more numerous and coming closer inshore. The fishes of both genera are generally excellent as food, especially when not too large, and are much employed as such, either fresh, salted, or sun-dried. Among the Sparidae we find the Pagrus spinifer and several species of Chrysopteryx, abundant in places near the shores of India, especially during the cold months, and held in great esteem. In the family of Polynemidae are some most valuable fishes, all being good as food, and two affording isinglass. Some of these have been known to exceed 300 lbs. in weight, especially in estuaries, where they are not uncommon. The justly celebrated mango-fish of the Bay of Bengal arrives during the S.W. monsoon, about June, and continues through the cold season. It ascends large rivers (from the Mahanadi and Ganges to those of Burma and the eastwards) for the purpose of spawning, and is of great repute for its excellent flavour. Natives term it Tapasi, changed by Europeans into Tupperse-nutchee, the original name being derived from certain aesthetics. A similarity has been drawn between their unkept hair and the long tendrils which in this fish spring from the base of the pectoral fins, and exceed in length that...
of the body. The Maigres, Sciaenidae, absent from the Red Sea, become abundant off the coasts of Sind and through the Indian Ocean. Some attain to 5 feet or more in length, but are sought after rather for the isinglass their air-bladders afford than for their flesh as food, the latter being dry and insipid. The sword-fishes (Xiphidae) are likewise numerous at times off the Coromandel coast during the cold weather, and their flesh is esteemed by the natives, although not brought to the table of Europeans. The horse-mackerels, or Carangidae, are among the most important sea forms to the natives, by whom they are highly esteemed as food. They are very abundant along the Coromandel coast, less so down that of Malabar, where the herrings take their place to a great extent. Some attain to a large size, and on the coasts of British India are never found to be poisonous, as is reputed to be the case elsewhere. Caranx Rottleri reaches 5 feet or more in length, but some species never pass 5 or 6 inches. These fishes are gregarious, and not so oft-nerved in the predaceous habits of some of those already referred to, while the same remarks likewise apply to the next few genera. The closely allied species of Chorinerus and Trachynotus afford a considerable amount of food to man, but, owing to their being dry and insipid, are generally salted or sun-dried. Pomfrets (Stromateidae) are justly esteemed by both Europeans and natives, and they are abundantly distributed throughout the Indian Ocean. Coming in-shore in large shoals about June, they disappear as suddenly as they come, some forms entirely departing about September. It is a curious circumstance that in all the adult forms the ventral fins are absent; in the young of the black species they are very long, but become absorbed as age advances. The mackerel family are exceedingly important, and the common Scromber microlepidotus is very abundant along the western coast of India throughout the cold season, and is extensively salted and sun-dried, but, owing to its rapidly tainting, it is rarely brought to the tables of Europeans; it is not nearly so common along the east coast of Madras and Bay of Bengal, but is found at the Andamans. In India its usual length is about 10 inches, but in certain localities it attains to a foot. Some other forms, which grow to a larger size, and are more predaceous than the common mackerel, likewise arrive during the cold season, when they prey extensively on the numerous herrings and other small fish. Among these large species are the tunny and the pekumys; these are terrors to the shoals of sardines, which appear to afford them delicious food. The seer fishes (Cubinum) are held in great esteem by Europeans, and when of a medium size, are besides the most delicate for the table. They are quite as precious as the tunny's, and attain to three feet and more in length. The voracious and dangerous Sphyramus, termed sharks in some places, and barracuda in the West Indies, grow to several feet, and all forms are used by the natives as food.

The marine siluroids, shear, or cat-fishes, which cannot be considered migratory, are known by the long feelers found round their mouths and absence of scales, and are of considerable economic value; although not esteemed if eaten fresh, still, numbers are salted for export, while their air-bladders are collected for the isinglass which they afford.

Siluroids are mostly found in muddy waters; they are common from Bombay down the western coast, and likewise from the mouth of the river Kistna along the muddy coasts of Bengal and Burma, becoming very abundant in the Malay Archipelago. Among what may be termed the scaled siluroids, a few are excellent eating, but the only one which is found in very large numbers is the bummalo or Bombay duck (Harpodon nehereus). Numerous at Bombay, it is rare all down the Malabar coast, but on the Coromandel side of India a few are taken at Madras; and as we proceed towards Vizagapatam they augment in numbers, and are common along the entire coast of Bengal and Burma, ascending large rivers, but not above tidal influence. Owing to their almost gelatinous character, they are easily sun-dried or salted.

The Chondropterygii, or sharks, rays, and skates, play an important part in Indian sea fisheries. Sharks are found along the whole seaboard, but coast and river shoals are more common occurrence. In some years they are more numerous than in others, and this is due to the presence or absence of shoals of smaller fish, as sardines. They are captured both for the purpose of extracting oil from their livers, as well as for their flesh, as those of a medium size are cut up, salted, and sold to the poor. Their fins, likewise, are exported to China, where, due to the gelatine contained in them, they are in demand for the purpose of making soups. Rays and skates exist in enormous numbers in the Indian seas, where they attain to a great size. The first appear to be gregarious, and may suddenly arrive, to the dismay of the owner of an oyster bed, as they rarely change their quarters so long as any molluscs are obtainable. Saw-fishes are taken for the same purpose as are sharks.

Of the non-migratory forms, some of which are predaceous, there are many in the Indian seas, and some are more directly serviceable to man. Although some of these are small, still they make up by numbers for their deficiency in weight, besides being more readily sun-dried, or salted with brine. The little Ambassas, consisting of small fishes rarely exceeding six inches in length, with the closely-allied Apogons, equally small, are similarly employed as food. The Pristiopomus attain to a larger size,—2 feet or more in length,—are more commonly eaten even while fresh, and some species are very numerous. Along the Coromandel coast, species of Synagris are extensively eaten, while the genera Equula and Gerres furnish an immense amount of food, which is consumed by the poor either when fresh or salted. The Mullids, so esteemed in some parts of Europe and rejected in others, furnish many Indian forms. They are, however, not esteemed; neither are the beautiful and large Lethrinus, nor the more flattened Teuthidida. The gobies of the sea do not attain to a large size, but are of value owing to their abundance. The spineless Anacanthina, or flat fishes, are by no means uncommon, the largest examples being found off the coast of Sind. The very young of the Indian species, similarly with those in Europe, have an eye on either side of the head, a subject which has been so elaborately examined by Steenstrup in 1864, Mr. Malm in 1868, Dr. Day and others, in order to ascertain how it is that with advancing age both eyes are found on the coloured
The Cuchia, like Anabas, are, among the other species, extensively employed for their heads, which are considered as delicacies. The little sandsmeta (Atherina), having a burningished silvery band, are taken in enormous numbers; but as they rarely exceed three inches in length, they are commonly sun-dried and exported. The Indian whiting (Sillago) arrives in large assemblages, and is esteemed as a light and wholesome food. The halfbeak (Hemiramus) is very common, especially during the cold season, while the roes are largely collected along the Malabar coast. But it is among the herring family that we find some of the most important of those fishes which not only afford food to man, but to their larger and stronger relatives. As a rule, they abound more on the Malabar than on the Coromandel coast. The oil-sardine comes in vast numbers, more especially to the western coast, but is uncertain in its movements; occasionally being absent for many consecutive seasons, it returns in enormous numbers. The same may be said of the numerous forms of anchovies, and the great varieties of other genera of the herring family.

There are fishes in Asia which respire atmospheric air directly. They possess respiratory organs in the form of an accessory respiratory sac, distinct from gills, and they are essentially amphibious. The genera of Indian fishes (excluding Chanos) which possess respiratory organs, having a lung-like function, and which are distinct from the gills, are, amongst the anachonterygians, species of Anabas, Polyacanthus, Osphromenus, and Trichogaster; also species of the Ophiocephalidae and the genera Claris and Saccobranchus among the Siluridae. Of the family Symbanchilae, is the Cuchia eel (Amphipnous cucha). The Ophiocephalidae are very predatory, and their favourite lurking-place is amongst the grass at the margin of a tank. These amphibious fishes, and also the spined eels, Rhynchoboddeliae, retire into the mud of tanks as the water dries up.

In January 1869, in Orissa, Dr. Day dug up in a tank, two feet below the mud, two Ophiocephalus punctatus and three Rhynchobodella aculeata. The Amphipnous cucha, or amphibious eel, has also been dug out of blue clay. They have blow-holes in the mud, as seals have in the ice. Mr. Bonynge says (America, p. 165) he had seen the natives in the N.E. of India dig fish out of the earth; the fish is called Zamin ki mutchee (earth-fish), of about 5 to 7 inches in length, flat, and black in colour, flesh hard, and in flavour somewhat like an eel. Tenmant tells us (Sketches, p. 351) that in Ceylon, where the country is flat, and small tanks are extremely numerous, the natives are accustomed in the hot season to dig in the mud for fish. Mr. Whiting, the chief civil officer of the Eastern Province, informed him that, on two occasions, he was present accidentally when the villagers were so engaged, once at the tank of Malliative, within a few miles of Kottiar, near the Bay of Trincomalee, and again at a tank between Ellendotorre and Armitiove, on the bank of the Vegal river. The clay was firm but moist, and as the men flung out lumps of it with a spade, it fell to pieces, disclosing fish from 9 to 12 inches long, full grown and healthy, which jumped on the bank when exposed to the sunlight. The Lepidosiren of Africa and S. America is placed midway between the reptiles and fishes, and has gills and true lungs. It has the habit on the approach of drought of burrowing itself several feet deep into the mud of the ponds in which it usually dwells. It does not appear to possess the power of travelling.

Fishes do travel,—not cells alone, which in all countries can move rapidly over moist land. Theophrastus (De Piscibus), the contemporary of Aristotle, is the first who mentions fishes found in the Euphrates, which in the dry seasons leave the vacant channels and crawl over the ground in search of water, moving along by means of their fins and tail. The travelling powers of the Ophiocephalus amphibius of Burma are known. The Ophiocephalus striatus, which occurs in the Indian Peninsula, attains a length of upwards of 3 feet. O. gachua grows to one foot long, and Dr. Day believes that they breathe air direct from the atmosphere. Dr. Bowring (Siam, p. 10), in ascending and descending the Meinam river, to and from Bankok, was amused with the sight of fish leaving the river, gliding over the wet banks, and losing themselves among the trees of the jungle. Bishop Pallegoix (Siam, i. 144) says fish will wander more than a league from the water. Some years ago, he says, a great drought had dried up all the ponds in the neighbourhood of Ayuthia; during the night torrents of rain fell. Next day, going for a walk into the country, he was surprised at seeing the ponds almost full, and a quantity of fish leaping about! ‘Whence have these fish come?’ he inquired of a labourer; ‘yesterday there was not one.’ He replied, ‘They were come under favour of the rain.’ In 1831, when fish were uncommonly cheap, the bishop placed 50 cwt. in his ponds, but in less than a month nine-tenths escaped during a rain that fell in the night. There are three species of this wandering fish, called Pla-xon, Pla-duk, Pla-mo, etc. The first is voracious, and about the size of a carp; salted and dried, it is to be preserved for a year. It is very abundant, is exported to China, Singapore, and Java, and is a particularly wholesome and health-giving fish. Ophiocephalidae have a great vitality. In China they are kept alive at the markets, and slices are said to be cut off their bodies as required by customers.

Near the rocks of the Ceylon coast are multitudes of the Salarias allices, which possesses the faculty of darting along the surface of the water, and running up the wet stones and across the sand with the utmost ease and rapidity. Mr. Gosse (p. 122) mentions having seen a species of Antennaria running quickly to and fro on the surface of the great beds of floating sea-weed in the Gulf.
Stream, progressing by means of its pectoral and ventral fins, quite out of water. The Hydraphyrgue of Carolina leave the drying pools and seek the nearest water, in a straight line, though at a considerable distance. The hassar of Esaequibo is the Doras costata. When the water is leaving the pools in which they commonly reside, the yarrow (a species of Esox, Linn.), as well as a species of the hassar, bury themselves in the mud, while all the other fish perish for want of their natural element, or are picked up by rapacious birds. The flat-head hassar, on the contrary, simultaneously quit the place, and march onward in search of water, travelling for a whole night in its search. They can live for many hours out of the water, even when exposed to the sun's rays. They project themselves forward on their bony arms by the elastic spring of their tail; their progress is nearly as fast as a man can walk. Sir R. Schomberg tells us that the hassar are occasionally met with in such numbers in their travels, that the negroes fill baskets with them. If they fall in finding water, they are said to burrow in the soft mud, and pass the dry season in torpidity like the lepidoiren.

The travelling fish of India (Ophiocephalus), possessing an amphibiuous respiration, is capable of traversing from one pond to another, as necessity or fancy dictates. Jugglers carry them about in order to assist in their performances; while so great is their vitality, that the saleswomen cut portions off them while still alive, for disposal to purchasers, who will only give a decreased price when life ceases to exist. Their mode of continuing their kind is likewise very interesting: they live in pairs, occasionally in the holes made by crabs or birds situated on the banks of rivers, while the forms which reside in tanks construct nests of the grasses growing there. Bitting some off and entwining others, they construct a domicile wherein their eggs are deposited, while they protect their young until they are able to shift for themselves.

In Ceylon, the fish most frequently seen travelling is a perch called by the Singhalese Kayava or Karwila, and by the Tamil, Pannel-i-eri, or Samuel. It is march overland in search of water. It grows to about 6 inches in length, the head round and covered with scales, and the edges of the gill-covers strongly denticulated. Aided by the apparatus in its head, this little creature issues boldly from its native pools, and addresses itself to its toilsome march, generally at night or in the early morning, whilst the grass is still damp with the dew; but in its distress it is sometimes compelled to move by day; and Mr. E. L. Layard on one occasion encountered a number of them travelling along a dusty road under the midday sun. Mr. Layard (Ann. Nat. Hist. Mag. 1853) says it is most tenacious of life. Dr. Hamilton Buchanan says he had known boatmen on the Ganges keep them for five or six days in an earthen pot without water, and daily to use what they wanted, finding them as lively and fresh as when caught.

Mr. Morris, Government agent, Trincomalee, writing to Sir J. E. Tennant on this subject in 1856, mentioned that when inspecting the bund of a large tank at Nade-cadua, he found numbers of fish struggling upwards through the grass in the rills formed by the trickling of the rain. There was scarcely water enough to cover them, but nevertheless they made rapid progress up the bank, and his followers collected about two bushels of them at a distance of 40 yards from the tank. They were forcing their way up the knoll. They were chub, the same as are found in the mud after the tanks dry up. Subsequently, in July 1857, Mr. Morris mentioned that as the tanks dry up the fish congregate in the little pools, till at last you find them in thousands in the moistest parts of the beds, rolling in the blue mud, which is at that time about the consistence of thick gruel. As the moisture further evaporates from the surface, they are left uncovered, and they crawl away in search of fresh pools. In one place he saw hundreds diverging in every direction from the tank they had just abandoned to a distance of 50 or 60 yards, and still travelling onwards. His impression was that this migration takes place at night, or before sunrise, for it was only early in the morning that he had seen them progressing. All in the act of migration had their gills expanded.

Many fish die rapidly in turbid water, and they strive to escape from it. On the 2d August 1878, fish left the Ganges at Mirzapur for the dry land, but huge quantities of rohu, tengra, eels, hilsa, skates, piyasi, saoli, bachwa, and other fish died in the river. The smallest quantity of water, however, suffices to enable the multitude of small fishes to climb high away from the tanks of India to the high ground, when the water of the tank has become loaded with soil washed down by heavy rain.

_Fish-rain._—Dr. Buist, writing in the Bombay Times in 1856, mentioned that in 1824 fishes fell at Meerut on the men of Her Majesty's 14th Regiment, then out at drill, and were caught in numbers. In July 1826, live fish were seen to fall on the grass at Moradabad during a storm. They were the common cyprinids, so prevalent in Indian waters. On the 10th of February 1830, at noon, a heavy fall of fish occurred at the Nokulhatta factory in the Duce zillah; deposits on the subject were obtained from nine different parties. The fish were all dead; most of them were large, some were fresh, others were rotten and mutilated. They were seen at first in the sky like a flock of birds, descending rapidly to the ground; there was rain drizzling, but no storm. On the 16th and 17th of May 1838, a fall of fish occurred in the zillah of Futtehpur, about 3 miles north of the Jumna, after a violent storm of wind and rain. The fish were from 1½ lbs. to 3 lbs. in weight, and of the same species as those found in the tanks in the neighbourhood. They were all dead and dry. A fall of fish occurred at Allahabad during a storm in May 1838; they were species of the chowla, and were found dead and dry after the storm had passed over the district. On the 20th of September 1839, after a smart shower of rain, a quantity of live fish, about 3 inches in length, and all of the same kind, fell in the Sunderbuns, about 20 miles south of Calcutta. The fish did not fall here and there irregularly over the ground, but in a continuous straight line not more than a span in breadth. During a tremendous deluge of rain at Kattyawar, on the 25th of July 1850, the ground around Rajkot was found literally covered with fish; some of them were found on the tops of haystacks, where probably they had been
drifted by the storm. In the course of 24 successive hours, 27 inches of rain fell, 35 fell in 26 hours, 7 inches within one hour and a half, being the heaviest fall on record. At Poona, on the 3d of August 1852, after a very heavy fall of rain, multitudes of fish were caught on the ground in the cantonments, full half a mile from the nearest stream. Sir J. E. Tennant, when driving in the cinnamon gardens near the fort of Colombo, saw a violent but partial shower. On coming to the spot, he found a multitude of small silvery fish, from 1 ½ to 2 inches in length, leaping on the gravel of the high road, numbers of which he collected and brought away; and Mr. Whiting, civil servant of Ceylon, mentioned to Sir J. E. Tennant that he had been often told by the natives at Trincomalee that sometimes rainfed fishes at that side of Ceylon.—Tennant's Sketches, pp. 342-4.

Gosse, Romance of Nat. Hist., 1861.

Tame Fish. — In the neighbourhood of Tavoy are two small currentless basins in the Pagaya river, at the foot of pagoda-crowned precincts, 100 to 200 feet high. The fish, a species of barbel (Barbus Mortonis), are held sacred to the pagodas by the Buddhists, and come in shoals for rice thrown to them by passers-by, as fearless of man as of the barking deer that drink their waters. Mr. Hodgson mentions a similar tameness amongst the large gold-fish at Japan, which almost rose from their natural element to gasp and gasp, with open mouths, at the bread, biscuit, or cake which his little girl was half afraid to offer them (Hodgson's Nagasaki, p. 75). Dr. Oldham also tells us that in the middle of the Irawadi, about 30 miles above the town of Tsengoo, and opposite the small village of Thika-dan, on nearing the island, the headman in the boat shouted out: The horse-tail is sacred! was calling the fish. The boat was soon surrounded with about fifty large fish, some three or four feet long, a kind of blunt-nosed, broad-mouthed dog-fish. In one group, which he studied more than others, there were ten. These were at one side of the boat; nearly halF their bodies protruded vertically from the water, their mouths all gaping wide. The boatmen were feeding them with some of the rice prepared for their own dinners, by throwing little pellets down the throats of the fish. Each fish, as it got something to eat, sank, and, having swallowed the portion, came back to the boat-side for more. The men continued occasionally their cry of Tet-tet-tet! and, putting their hands over the gunwale of the boat, stroked down the fish on the back precisely as they would stroke a dog. This was kept up for nearly half an hour, moving the boat slightly about, and invariably the fish came back with a gape as before. The only effect which the stroking down or patting on the back seemed to have, was to cause them to gape still wider for their food. The fish are found in the deep pool formed at the back of the island, by the two currents meeting round its sides, and the phoungyes are in the habit of feeding them daily. It is regarded by the Burmans as quite a sight, which the people come from great distances to see, as well as to visit the pagoda, which is very ancient and much venerated. During an annual March festival, it is not unusual for the visitors to take the fish into their boats, and gild their backs with gold-leaf, as they do in the ordinary way to pagodas; and Mr. Oldham observed remains of the gilding visible on one of the fish. He wished to take one of the fish away, but refrained, as the people seem to regard the act as sacrilege (Mr. Oldham, in Yule's Embassy).

Sacred Fish. — The Hindu races, who worship, in addition to the works of their own hands, so many varied products, and so large a number of mammals and reptiles, do not, seemingly, worship fish. In their religion the Matsya Avatara is the fish incarnation of Vishnu, in which he preserves a man named Menu, with the seeds of all things, in an ark during the deluge. It is the Aryan Hindu tradition of the flood of Noah. A tank or pond with all its contents, may, however, with the Hindus be devoted to a deity; and Colonel Tod mentions that when, one day, he had thrown his net into a lake, which abounded with a variety of fish, his pastime was interrupted by a message from the regent, Selim Singh, 'to tell Captain Tod that Kotah and all around it are at his disposal, but these fish belong to Kaniya.' On which, of course, he immediately desisted, and the fish were returned to the safeguard of the deity. In such sacred tanks fish will feed from the hand; and in the Mahanadi, where it is 3 miles broad, he tells us (Travels, p. 9) fish will follow for miles for a little burnt rice. The amphious snake-head fish (Ophiocephalus amphihebus) occurs in the fresh waters of Burma, but the natives regard them with superstitious awe, and do not eat them. They have a legend that they were formerly men, changed into fish for their sins; and the Pwo Karen of Tavoy say that if people eat them they will be transformed into lions. The boura chang, a fish of Bhutan, another Ophiocephalus, is believed by the natives to fall from heaven, from the circumference of its being found after rain far from the water.

Flat-fishes, when very young, swim in a similar way to other fishes, with their dorsal fins above, their anal fin below them, and possessing an eye on either side of the head. As they grow older, this erect position becomes lost, their sides become their upper and lower surfaces, and both eyes are on the superior or coloured side of the body. The adult, when at rest or swimming, usually keeps near the bottom of the water, and progresses by means of a sort of undulating motion of the whole body, and of the unpaired fins. The bodies of these fish are broad, flat, and margined in almost their entire extent by the dorsal, caudal, and anal fins; while not only the muscles, but the skin, the gills, gill-covers, and even the pectoral fin-rays, are less developed on the side than on the other side, the eye also being, as it were, bent round to this eyeless side, towards which the anterior part of the face seems to be twisted. It had been known from a very early age that these fishes, when first emerging from the ova, and while in a pellucid condition, have an eye on either side of the head; that by degrees the eye, on what eventually will be the eyeless side, becomes depressed, while at the same time a dark spot appears on the opposite side of the head, so that the fish almost seems to possess three eyes. Double fishes have been observed in flounders, turbot, plaice, soles, etc., and they are seen to swim vertically, and to be more frequently found nearer the surface of the water than those which progress in a normal manner. These double flat-fishes are held in
greater estimation for the table than others which have an uncoloured as well as a coloured side. There are albinoi, uncoloured or nearly white on both sides, but still retaining their normal form, but in some which have been carefully examined, no sexual parts could be detected. Fish is largely partaken of by the Hindu women of Bengal, whilst unmarried or married, but a widow never partakes of it, and the 11th or ekadasi of the increasing moon is a day of close fast to a widow.

The names of fish have been given by people from their outward forms and habits, as bird fish; parrot, porcupine, scorpion, frog, and toad fish; pilot fish; rudder, fan, or sail, and sailor fish; angler fish and archer fish; sucking fish, doctor fish; gilt-head, black, blue, and yellow fish; glass eel, gold and silver fish, file and pipe fish, sword fish, saw fish, flying fish; climbing, walking fish; devil fish, sea dragon, and sun fish; transparent sole, luminous shark, pretty fish, albicore, bonito, tunny. The gold fish of China is a species of carp, Carassius auratus. The leather jacket or file fish is a species of the genus Balistos of the South Seas, Anamans, etc. The fan fish, called also sail fish, is said to raise the dorsal fin like a fan, and employ it as a sail. Its dorsal fin is 3½ to 4 feet long, and the fan fish 10 to 14 feet long. Its colour when in the water is a beautiful purple and green, with silvery belly, and displaying a rich variety of brilliant colours. The angler fish, the fishing frog, and the sea-devil are species of the family Lophiidae, but are not of Asia; the fighting fish of Slam is the Macropodus pugnax, and the glass eel is a species of the Leptocephalidae.

Fish-hatching. In China the hatching of fish is extensively practised. The sale of spawn for this purpose forms an important branch of trade in China. The fisherman collects with care, on the margin and surface of water, all the gelatinous matters that contain spawn of fish, which is then placed in an egg-shell, which has been fresh emptied, through a small hole; the hole is then stopped, and the shell is placed under a sitting fowl. In a few days the Chinese break the shell in warm water (warmed by the sun), where they are hatched; the young fish are then kept in water until they are large enough to be placed in a pond. This plan in some measure counteracts the great destruction of spawn by trawl-nets, which have caused the extinction of many fisheries. Mr. Francis Day, a Madras medical officer, made great efforts to introduce ova of exotic fish into India, and made recommendations for the protection of young fry. A few drops of a weak solution of peracetic acid of lime, added night and morning, sweetness, warm, and supplies oxygen, and thus diminishes the mortality in fish-hatching.

Luminous Fishes. The abdominal surface of sharks is said to be luminous, but due to the presence of small invertebrata; and shoals of fish are said frequently to emit flashes of light, perceptible even at great depths. The sand-lance, at night, has a silvery brilliancy, and the cod and other fish after death emit a phosphorescent light. Certain pelagic or deep-sea fishes, as Argyropelecus, Sternoptyx, Ichthyodectes, Malacocbus, Gonoctoma, Chauliodus, Stomias, etc., possess luminous organs of a circular form, some being as impressions, others as slight prominences of the skin. In Britain, the pearl-sides (Malacocbus borealis, Yarrell) is one of these fishes.

Weapons. Silet fishes or silurids are generally well armed. They have mostly strong dorsal and pectoral spines, often serrated, with which they can inflict dangerous lacerated wounds. In the marine and estuary forms the armature is invariably spinal. Species of Polyacanthus inflict punctured wounds; and the serrated spines on the tails of the skates cause lacerated wounds. The silurid Thalassophyseus has a distinct poison gland; while the Synanceia verrucosa has a tube at each of its dorsal spines, and a poison gland at its base. The wounds are very venomous.

Alates tili, Cuv. and Val., inhabits the sea of Penang, Malayan Peninsula, Singapore, Borneo, Java, Sumatra, Pondicherry, river Cauvery, and Bombay. Total length, 1 foot 9 inches. Like A. australis in Bengal, the A. tili is, by the English of the Straits Settlements, denominates shad or sable-fish, and is equally valued for its flavour. Both are, however, somewhat oily, very rich, and bony. A. tili is remarkable as forming in the Indian Archipelago a distinct and important branch of fishery, principally for the sake of its roe. It is the kind of shad to which Mr. Crawford refers as frequenting the great river Siak in Sumatra, and of which the dried roe, of enormous size, constitutes an article of commerce (Crawford, Hist. Ind. Archipel. iii. p. 440; Doyle on the Production of Isinglass, p. 76). Mr. Moor, in Notice of the Indian Archipelago, etc., says (p. 29), at Bukit Batu (opposite to and a little to the southward of Malacca), a place on the main of Sumatra within the strait formed by the island of Banka, exists an extensive fishery of the trubu fish. The fish itself is sufficiently known in all the neighbouring seas, but found with a roe only here (that is to say in shoals, for it is plentiful at Penang, Malacca, and Singapore), which makes it certain that it repairs to this favoured place for the purpose of spawning. The trubu, about a cubit long, is taken in and 4 fathoms water on a mud bank. About 300 boats are engaged at all seasons in the fishery, with the exception of four days during dead neap tides. The roes are an article of trade seaways, and the dry fishes are sent into the interior of Sumatra. The raja of Siak draws a revenue from this fishery of 72,000 guilders yearly, receiving a certain duty upon the quantity taken. From the rate and amount of this duty, it is ascertained that the quantity of fish caught yearly amounts to between fourteen and fifteen millions. In the Malayan markets the roe is called Tahrur ikan, the fish-roe. Like the preparation of fermented fish and shell-fish, Balachan, it is largely used by the Malays and Chinese to season and make their food palatable, and is less a favourite relish with Europeans in Sumatra. The fresh roe is thoroughly salted, and next partially dried, so as to retain a slight moisture, in which state it is by hundreds closely placed in casks, and thus exported. In the Malayan settlements the price is from 3 to 4 Spanish dollars per hundred. The dealers there export considerable quantities to China, after having taken the precaution to re-pack the roes between layers of salt, and to sprinkle them with arrack. To dress them, they are soaked for about half an hour in water, and then fried. As the roe appears in commerce, it is of an elongated flat shape, measuring from 6 to 8 inches in length, about 2 in breadth, and ¾ of an inch in depth, of
a deep amber colour. The single eggs are larger than those of A. Ilisha.

The Arius genus of fishes, of the Indian, Malay, and Japanese seas, furnish isinglass. A. arias, Buchenan Hamilton, inhabits the Gangetic estuaries near Pondicherry, and the estuaries near Penang, the Malay Peninsula, and Singapore. It is 22 inches long, forms an article of food, and more than any other of the Siluride contributes to the isinglass of Indian commerce.

Arius militaris, Linna., 18 inches long, inhabits the Coromandel and Malabar coasts, the Ganges, Irawadi, and the seas and estuaries of the Malay Peninsula. Its air-vessel is preserved as isinglass.

A marine siluroid fish, one of the Ariina, noted for the males carrying the eggs in their mouths until the young are hatched; consequently during this period they have to abstain from all food.

The bodies of the genus Chanda (Chandi, Hind., silver) are more or less diaphanous.

Botrachus grunniens, Linna. The natives of India attribute poisonous qualities to these fishes, and reject them even as manure. The créaking sound they emit has been noted by Buchanen. They are capable of living a considerable time out of their element.

Chelona rostrata looks for an insect on the foliage overhanging its pool, and suddenly shoots on it from below a drop of water, which brings the insect down. The Javanese keep them for their amusement. Surgeon James Mitchell, R.N., mentions having seen some archer fish kept in a pond at Java in 1822. In the pond was a pole with cross bits of wood, on which were placed beetles, and the fish discharged from their mouths a small jet of water with such precision as to force them from the twig into the water. These fish were about 5 or 6 inches long, with blackish stripes. Chatoledon praxetatus, Cantor, like other species of this and the neighbouring genera, expires immediately when removed from its element. It appears to be allied to C. reticulatus and C. lunata, Cuv, and Val. The gaudiest fish live among the coral reefs, such as species of the Chatoledon, the Balistine, and Glyphisodon. The Mesopon and Lethris feed on crustacea, and is distinguished for the beauty of its colours and the symmetry of its form.

Clupeonia perforata, Cantor, inhabits the sea of Penang, Malayan Peninsula, Singapore, and Sumatra. Total length, 5 inches. They are of delicate flavour, and pass in the Settlements of the Straits as sardines, in imitation of which they are sometimes preserved in oil. It has a resemblance to Alausa argyrochloris, Cuv. et Val. (vol. xx. p. 440). The general form, the yellow dorsal fin with a small black spot, give it a certain resemblance to Meleta venenosa, Cuv. et Val. (vol. xx. p. 377). Mr. Lewis says that during his official residence at Bencoolen in 1822, great numbers of what were supposed to be this identical species, presented the unusual appearance of having red eyes. Many natives, after having eaten these fishes, were suddenly attacked with violent vomiting, which in cases where remedies were not immediately applied, was known within an hour to terminate fatally. At the same time, such of these fishes with the ordinary silvery eyes were as formerly eaten with impunity. This phenomenon recurred at Bencoolen during the seasons of 1823 and 1825, but not of 1824. It was surmised that the poisonous fishes had fed on a gelatinous substance which at that season exudes from the beautifully coloured coral reefs on that part of the coast of Sumatra. It is, however, more probable that the poisonous fishes were shoals of Meleta venenosa, an inhabitant of the Seychelles and the neighbouring seas, which happened in those seasons to visit Sumatra. M. Valenciennes describes this fish as being poisonous, and producing effects as noted above. In the Straits of Malacca, Clupeonora perforata has never been known to produce bad effects.

Cylbium species are the seer fish, largely used as food. Dussumieria acuta, Cuv. and Val. x. p. 467, pl. 606, is the Tamban bulat of the Malays. Single individuals occur at Penang at all seasons, but numbers from June to September. It is highly valued for its delicate flavour, and passes commonly as a sardine. The latter denomination it shares, however, with Clupeonora perforata, with which it is also confounded by the Malays under the common name of Ikan tamban. Both species have been prepared as sardines à huile.

Echenes nucrator, Linna., occurs at Malacca. The Malays consider this fish to be powerful nuture for fruit trees.

Engraulis Brounii, Gmelin, inhabits the sea and estuaries of the Malayan Peninsula and islands, China Sea, New Zealand, Madura, Java, Sumatra, Bombay, Coromandel, Bay of Bengal, Gangetic estuaries, Isle of France, Australia, New York, Havana, Jamaica, Vern Cruz, Martinique, Barbadoes, St. Christopher, Rio Janeiro. Total length, 6 inches. In Java, Sumatra, and the Straits of Malacca, large quantities are preserved both for local consumption and exportation to China and India. The delicious red fish condiment (Ikan merah of the Malays), or Malacca fish, used as a relish, is prepared at Bencoolen as follows:—After the heads have been removed, the fishes (those of middling size are preferred) are cleansed, salted (in the proportion of one to eight parts of fish), and deposited in flat glazed earthen vessels. In the latter they are for some days subjected to pressure by means of stones placed on thin boards or dried plantain leaves. The fishes are next freed from salt, and saturated with vinegar of coco palm toddy, after which are added powdered ginger and black pepper (the latter mostly entire), and some brandy and powdered red rice. After having been kept for three days, a little more vinegar is added before placing the fishes in well-closed jars or bottles. They should be kept four or five months before being used. The expense of a quart bottle of the condiment is about 30 cents, the selling price one Spanish dollar. The Chinese settlers in the Straits prepare a similar red condiment with slices of Polynemus Indicus and P. tetradactylus, and also prawns.

Red rice is the variety of Orzya sativa called glutinosa (Pulut or Bras sepolit of the Malays), steamed in an infusion of cochinilla. In the Straits red rice is imported from China, and sells at the rate of 10 cents of a dollar per pound.

Equula insidatrix, Bloch, and Equula longimana, Cantor, also Ganza equulaformis, Kuppell, are very abundant in the Straits of Malacca at all seasons, and quantities, both fresh and dried, are consumed by the natives.

Gnorami, a fish of the Mauritian, is esteemed of more delicate flavour than the salmon or turbot.
FISHES.

Harpodon nehereus, the bummalo or Bombay duck, and Saurus nehereus of B. H., has the upper part of its head, back, and sides light grey or 'dust-coloured, semi-transparent like gelatine, with minute star-like black and brownish dots; the anterior part of the abdomen is pale silvery bluish, rest whitish; cheeks and opercles pale silvery bluish, dotted like the body; fins transparent, coloured like the body, but more closely dotted, so as to appear pale blackish. It inhabits the sea of the Malayan Peninsula and islands, Chusan, Woosung, Canton, Madura, Java, Sumatra, Tenasserim, mouths of the Ganges, Vizagapatam, Bay of Bengal, Bombay, Malabar. The total length is 11 inches. The fish is of most voracious habits, gorging itself with its own species, and other fishes of nearly its own size, and with crustacea (shrimps). It is frequently taken with the stomach and the jaws expanded with prey. It is very short-lived, more so than either S. trachinus or S. myops, and the whole body becomes at certain seasons brilliantly phosphorescent. In the Straits of Malacca it is at all times very numerous, although less so than it is at the Sandheads or in the mouths of the Ganges. Although very rich, it is a great delicacy immediately after it is taken. Salted and dried, it is also highly valued, and in this state it occurs in commerce under the denomination of Bombay ducks, the Bummalo of Bengal, and the Banmish of Bombay, large quantities of which are annually exported from Bombay and the Malabar coast to all parts of India and to London.

Hippocampus russelli, Cuv. and Val., is the Tola pendeck of the Malays (pendek, short). The Malays thus denominate all the species of Henniramphus, to distinguish them from those of Bolone (toda) of the Malays. At Penang, H. Russelli is numerous at all seasons, and larger individuals occur at irregular intervals. They appear at European tables under the appellation of guard fish.

Hippocampus munnulhus and H. comes of the Penang seas, when drying assume the figure of a horse head, and are known to all as the sea-horse. Their movements are most graceful, while by means of a noise somewhat resembling a cough, they appear to be able to communicate one with another.

Macropodus pugnax, Cantor, occurs numerously at the foot of hills at Penang. Like the rest of the family, it is capable of living for some time out of water. The Siamese, keep them in jars with water, where the larvae of mosquitoes is their food, and denominate them Pla kat (Pla, fish; Kat, a fighter). The real fish, however, the exhibition of whose combats is a popular amusement with the Siamese, appears to be a variety of the present species, produced by artificial means, like the varieties of the golden carp of China, and Dr. Cantor names it Macropodus pugnax, var. (pl. ii. fig. 4), Pla kat of the Siamese. When the fish is in a state of quiet with the fins at rest, the dull colours present nothing remarkable. But if two are brought within sight of each other, or if one see its own image in a looking-glass, the little creature becomes immediately excited, the raised fins and the whole body blaze with metallic colours of dazzling beauty, while the projected gill membrane, waving like a black frill round the throat, adds something grotesque to the general appearance. In this state it makes repeated darts at its real or reflected antagonist. But both, when taken out of each other's sight, instantly become quiet. This description was drawn up in 1840 at Singapore, where a gentleman had been presented with several by the king of Siam. They were kept singly in glasses with water, fed with larvae of mosquitoes, and had thus lived for many months. The Siamese are as inatuated with the combat of these fishes, as Malays are with their cock-fights, and stake considerable sums, and sometimes their own persons and their families. The licence of exhibiting fish fights is farmed, and affords a considerable annual revenue to the king of Siam.

The Osphromenus olfax and Trichopodus tri-chopterus, Pallas, are likewise very pugnacious amongst themselves.

The Magura fish in the Colombo lake is said to grunt under water when disturbed; and Bishop Pallegoix, in his account of Siam, speaks of a fish resembling a sole, but of brilliant colouring with black spots, which the natives call dogs' tongues. It attaches itself to boats, and gives out a very sonorous and harmonious sound (Tenn. ii. p. 470). Dr. Jordan says, 'I have every reason to believe that this is the so-called sable fish of Trichinopoly, which ascends the Cauvery during the freshes for the purpose of spawning, and is caught for the sake of its roe, which is highly esteemed.' It is called Ocellan-min at Madras.

Plagiusa potbus, Cuvier, the Ilan leedah of the Malays, is of excellent flavour, and, like Plagiusa trichopterus, is esteemed at European tables under the denomination of sole. The species are all distinguished for their tenacity of life. The fishermen at Penang assert that some species of Plagiusa shool at certain seasons.

Plotosus anguillaris and P. albilabris both occur in the seas of the Malay Peninsula. At Penang, the latter species is less numerous than the former. Both are eaten by the poorer class of natives. The wounds of both are equally dreaded.

Polynemus longifilis, Cuv., P. paradisicus, Linn., and P. risus, are the mango fish, or tapasi, tapasi mutchi, noticed at page 1109.

Racoula Russelliana, Gray. At Penang, individuals from 4 to 6 inches in length are numerous at all seasons, although less so than they are at the Sandheads and the mouth of the Ganges. The Bengal fishermen denominate the species Potassah-Fessah or Phassah, a generic term, particularly applied to Engraulis phassah, Buchan., and E. telahar, Buch. It is a heavy swimmer, and, like the rest of the Clupeide, expires immediately on leaving its element. It is chiefly consumed in a dried state.

Scatophagus argus, Linn., is eaten by the natives, though many reject it on account of its reputed disgusting habits. In several which were examined in the estuaries of the Ganges and at Penang, the stomach contained remains of small fishes and crustacean. According to Bennett, it is in Ceylon angled for on hooks baited with a kind of seaweed (Fendah), of which this fish appears to be particularly fond.

Stromates niger, the black pomfret of India, is taken abundantly along the coasts of India, and is largely dried for export to the interior. It is
at all seasons taken in abundance in the Straits of Malacca, where, however, it is considered inferior to Stromateus Sinensis, the white pomfret. In a dried state it is largely exported inland, and thus it appears in the bazaars of Hindustan, which are chiefly supplied from Bombay. S. Sinensis is the pomfret. It is justly renowned for its flavour, but it requires to be used when freshly taken. In the Straits and on the Coromandel coast it is abundant at all seasons. At the Sandheads in the Bay of Bengal (21° N., lat.), it occurs, but less numerous. Stromateus argenteus, Bloch., in the Straits Settlements, as well as at Madras, is likewise denominated the white pomfret. In abundance and excellence it vies with S. Sinensis. Stromateus cinereus, Bloch., is abundant at Penang, but probably from its inferior size it is considered somewhat inferior in quality. At the Sandheads it occurs rarely. The various pomfrets are valued by Europeans as food.

Toxotes jaculator, Pallas, or archer fish, appears to be the variety described by MM. Cuvier and Valenciennes, from a drawing in Col. Farquhar's possession. The food of several examined consisted of remains of crustacea. In the Straits of Malacca this fish occurs in all seasons, but not numerous. It is eaten by the Malays.

Tetraodon species have the power of inflating the abdomen, and in this state, when taken or handled, they emit a grating sound. They are also remarkable for tenacity of life, which they are capable of sustaining for several hours after having been taken out of their element. They have a peculiar disagreeable odour, resembling that of the Gobiodon, which continues for several years in specimens preserved in spirits of wine. In the Malayan countries they are considered poisonous, and are even objected to as noisome.

Of the Torpedinidae, several genera and species occur, viz. Nacire Indica, Astrapte diplurygyia, Temera Hardwickii, and Cystecercus temera. Dr. Cantor says large individuals of Nacire are at Penang of rare occurrence, but younger, from 3 to 6 inches in length, are taken at all seasons. In or out of water they may be handled with impunity. Several species of fishes introduced in a jar filled with sea-water, and containing a large Nacire, showed no consequences from the contact, nor did they appear to avoid the torpedo. The food of this and the other Malayan Torpedinidae consists of crustacea and testacea.

Teuthis, Linn. All the species of this genus are edible, though supposed by the Malays of the Straits to be highly poisonous. They are not eaten by them, but set aside among offal of fish to be used as manure.

Trichoplus trichocerus, Pallas, like the rest of the family, is capable of sustaining life out of water, particularly if kept in wetted fresh leaves, or occasionally sprinkled with water. At Penang it is numerous in streamlets and ponds, where it is eaten by the poorest classes. The exquisite beauty of the metallic iridescent colours makes these fishes acquisitions in garden tanks. Like Osphromenus olfax, they are very pugnacious among themselves. Both at Penang and at Malacca the Osphromenus olfax (Commerson) has been successfully naturalized, though in the former place it is not numerous, but confined to a few ponds. They become tame, so as to appear on the approach of their feeder, and will rise to flies, beetles, and certain flowers, particularly a large lilicrisms. About 1830, several were imported, and placed in a tank in the Calcutta Botanical Gardens, where they appeared to thrive; and 300 were introduced into the Madras Presidency, and are said to be doing well. A second species of Trichoplus has been discovered by Dr. Campbell, superintendent of Darjiling, in the rivers at the Sikkim passes in the northern frontier of Bengal.

Warm-water Fishes. — In the hot springs of Kannea, in the vicinity of Trincomalee, the water flows at a temperature varying at different seasons from 85° to 115°. In the stream formed by these wells, M. Raynaud found and forwarded to Cuvier two fishes which he took from the water at a time when his thermometer indicated a temperature of 87° Reaumur, equal to 115° Fahrenheit. The one is an anguilliform, the other an ambassid; and to each, from the heat of its habitat, he assigned the specific name of Thermals. A loach, Cobitis thermals, and a carp, Naria thermoiceus, were also found in the hot springs of Kannea, at a heat 40° Cent., 114° Fahrenheit, and a roach, Lencisus thermals, when the thermometer indicated 50° Cent., 122° Fahrenheit.

Fish have been taken from a hot spring at Puri when the thermometer stood at 112° Fahrenheit, and as they belonged to a carnivorous genus, they must have found prey living in the same high temperature (Journ. Asiatic Soc. of Beng. vi. p. 465). Fishes have been observed in a hot spring at Manilla, which raises the thermometer to 187°, and in another in Barbary, the usual temperature of which is 172°; and Humboldt and Bonpland, when travelling in South America, saw fishes thrown up alive from a volcano, in water that raised the thermometer to 210°, being two degrees below the boiling point.—Patterson's Zoology, part ii. p. 211;yarrell's Brit. FISHERIES. FISHERIES. 

of Eastern and Southern Asia. The numbers of fish in the seas of India are vast, but the harvest is comparatively untouched; an enormous amount of food remains uncaught, while famines devastate the contiguous shores.

The fisheries of India ought to provide food for multitudes of its people, employing them in fishing, in the ship and boat building, in netting, curing, and transporting them. The heat of the climate early leads to putrefactive changes, and salt is very costly, and consequently the smaller fishes, as ambassids, equula, the Bombay duck (Harpolon neheurus), many of the herring family, and the immature of other fishes, are largely sun-dried, while the larger fishes are cut into slices and also dried in the sun. Wherever, along the southern coasts, salt can be obtained at a cheap rate, there fisheries are largely established, and the fishermen well-to-do.

In Sind, where the duty on salt had been 1s. the maund (of 824 lbs.), the value of the dried and salted fish exported was as under in the five years ending—

1857-58, £8,472 6 0 1867-68, £18,725 2 0
1862-63, 13,050 8 0 1872-73, 22,941 16 0
FISHERIES.

In the Bombay Presidency the imports of fish steadily decreased with the increasing duty on salt. For curing fish, about one part of salt is needed to three of fish; but where earth-salt is used, about 2½ parts of the earth to one of fish. Wherever salt can be cheaply procured, fisheries flourish, and salt fish is cheap, and largely exported. Species of the genera Lutianus or Mesoptron, though not of large size, come close inshore, and are largely used, fresh, salted, or sun-dried. The same remark is applicable to Pagrus spinifer and species of Chrysophrys, of the family Sparidae, abundant in the cold months, and held in great esteem. The Polyenidæ are all good, and some species attain to 300 lbs. in weight. The mango fish ascends large rivers, as the Ganges, Mahanadi, and Iravadi, and others to the east, in June, for the purpose of spawning, and continues there till the beginning of the following year. It is known as the tapasi mutchli, from the long tendrils that spring from its pectoral fins, and which exceed the length of the body. The maigres, species of the Scienidæ, are abundant off the Sind coast, and throughout the Indian Ocean. Some of them exceed 5 feet in length. They are somewhat insipid as food, but are valuable for their air-bladders, which are made into isinglass.

The sword-fish (Xiphidæ) are numerous, and are eaten by natives; but to the people the horse-mackerels (Carangidæ) are, from their abundance, the most important of the sea fish. Some attain a large size. These fishes are gregarious. Species of Chorinera and Trachynotus afford a considerable amount of food; they are generally salted and dried.

Pomfrets (Stromatidæ) are abundantly distributed throughout the Indian Ocean.

The mackerel family are important, particularly the Scomber microlepidotus, of all the seas around India, in the cold season. It taints rapidly, and is therefore extensively salted and sun-dried. It is commonly about 10 or 12 inches long. Some others of the mackerel family prey extensively on the numerous herrings and other small fish. Amongst these are the tunny and pelamys, which are teors to the shoals of sandlances.

The seer fish (Cybium, sp.) are held in great esteem by Europeans, and when of a medium size are the most delicate for the table. They attain to upwards of 3 feet in length, and are quite as predacious as the tunnies.

The voracious and dangerous Sphyrenæ, termed sharks in some places, are the Barnaculs of the West Indies. They grow to several feet in length, and all of the species are used by the natives of India as food. The siluroid, heat, or cat-fishes are known by the long feelers round their mouths, and the absence of scales. Numbers are salted for export, and their air-bladders are collected for the isinglass they afford. They are common in the muddy waters around the Indian, Burmese, and Malay coasts, and are very abundant in the Archipelago. One of the scaled siluroids is the bumblefo or Bombay duck (Harpodon meneurus). They are always glutinous, and are easily sun-dried or salted. They are in varying abundance round the coasts.

The Chondropterygli, or sharks, rays, and skates, are found along the whole seaboard, following at seasons the shoals of small fish or sardines. They are eaten; their fins are largely exported to China, and oil is extracted from their livers.

Rays and skates exist in enormous numbers in the Indian Seas, where they attain to a great size. They are supposed to be gregarious. Saw-fishes are taken, and are eaten.

The little Ambassia and closely allied Apogon are valuable from their numbers.

The Pristopomus attains to upwards of two feet. Some species are very numerous, and are eaten fresh and salted.

Species of Synagris are extensively eaten; and species of Equula and Gerres furnish an immense amount of food, both fresh and salted, but, like the beautiful Lethrinus and the flat-formed Tetrathidæ, they are little esteemed.

The Gobies of the sea are not large, but are very abundant.

The spineless Anacanthini, or flat fishes, are not esteemed as food.

The mullets (Mugilideæ) in the Indian Seas are about 24 species, frequenting the estuaries and entering the tidal rivers, and are esteemed as food, except in Kanara, where their snake-like heads prevent the people using them. They are extensively sun-dried and salted, and their salted roes are considered great delicacies.

The pretty little sand-smelts (Atherina) are sun-dried and exported. They have a burnished silvery band, and are taken in enormous numbers.

The Indian whiting (Silaga acuta) arrives on the Indian coasts in large numbers, and are esteemed as a light and wholesome food.

The half-beak (Hemiramus) is very common, especially in the cold season, and is largely eaten.

The abundant herrings family furnish largely food to man and to predaceous fishes. The oil-sardine comes in vast numbers, but irregularly, sometimes after several seasons; and the same may be said of the anchovies and the many others of the herring family.

Maury remarks that the places which are most favoured with good fish markets are the shores of North America, the E. coast of China, with the W. coasts of Europe and South America, and all of them are washed by cold waters, and their markets abound with the greatest extent of fish. The fisheries of Newfoundland and New England, over which nations have wrangled for centuries, are in the cold water from Davis' Strait. The fisheries of Japan and Eastern China, which almost, if not quite, rival these, are situated also in the cold water. Neither India nor the east coasts of Africa and south of America, where the warm waters are, have been famed for their fish, though 6000 to 8000 fishing vessels of all sizes, American, British, Dutch, and French, are engaged in the New England and Newfoundland fisheries. The sperm whale is eagerly pursued in the Indian and Southern Ocean, and in the Pacific. An immense number of log-books have been discussed at the National Observatory, with the view of detecting the parts of the ocean on which whales are to be found at the different seasons of the year. Charts showing the results have been published, and they form a part of the series of Mr. Murray's Wind and Current Charts. Of all the industrial pursuits of the sea, the whole fishery is the most valuable. The sperm whale is a warm-water mammal. The right whale delights in cold water. The fishery of the sperm
whale is largely followed in the Pacific, and in all the South Sea ocean between Africa and America, but wholly by fishermen from Europe and America.

The pearl fisheries alone, in the Persian Gulf, employ a great collection of ships; and the pearl fisheries of China and Ceylon are also valuable. In Ceylon about 10,000 canoes and boats are similarly employed. In the east and south of Asia, the people engaged in fishing by stake-nets, bag-nets, and hooks, in boats and in ships, are very numerous, and much of the food of their nations ought to be obtained from the seas and rivers; but the salt monopoly of British India places obstacles in the traffic of salted fish, and the wholesale destruction of fish in their migration to their breeding streamlets, with the minute size of the meshes of the nets used at all seasons, treble the selling prices of fish in the Indian markets. The usual price, therefore, of fish, is about the same as that of mutton.

Much ingenuity is shown. Tamed otters are trained to aid in fishing; in China, coronrats are trained to catch fish, which they bring to the boatsmen. The fishermen of the Indus, when the river is in flood, float themselves down on an open-mouthed earthen jar, and, letting down a three-cornered net, catch the hilsa fish as they pass up the stream.

There are no seas in the world more abounding in excellent fish than those of the Asiatic Archipelago, and a few of them are of excellent flavour. Fish constitutes the chief animal aliment of all the inhabitants, and everywhere of those of the seacoast, either by profession or by profession. Among the best fisheries are those of the eastern coast of the Malay Peninsula, those of the entire Straits of Malacca, of the northern coast of Java, and of all the coasts of Borneo and Celebes, with those of the Philippine Islands. The taking of the mother-of-pearl oyster, the pearl-oyster in a few places, of the holothuria or treapang, and of the shell tortoise, form valuable branches of the Malayan fisheries.

On the Bombay side there are many large boats, with crews of 12 men each, constantly employed in the shark fishery at Karachue. The value of the fins sent to Bombay varies from Rs. 13,000 to Rs. 18,000 a year, each boat earning perhaps Rs. 1000 annually, or Rs. 100 per man. From this falls to be deducted the cost of material and other charges. Shark-fins form a large part of their profits; they sell in China at about 32 dollars per pikul, or 26 per cwt. In the future the market the ordinary selling price is from 15 to 16 dollars, or from £2, 10s. to £3 per cwt. This trade was noticed by Dr. Royle (On the Production of Isinglass, 1842). It affords on some occasions to Bombay alone, taking fish-maws and shark-fins together, as much as 3 lakhs of rupees, and furnishes the chief means of support to at least 3000 fishermen, or, including their families, to probably not less than 15,000 human beings. One boat will sometimes capture at a draught as many as a hundred sharks of different sizes; but sometimes they will be a week, sometimes a month, without securing a single fish. The great basking shark, or mhor, is always harpooned; it is found floating or asleep near the surface of the water, and is then struck with a harpoon 8 feet long. The fish once struck is allowed to run till tired, and is then pulled in and beaten with clubs till stunned. A large hook is now hooked into its eyes or nostrils, or wherever it can be got most easily attached, and by this the shark is towed in-shore; several boats are requisite for towing. The mhor is often 40, sometimes 60 feet in length; the mouth is occasionally 4 feet wide. All other varieties of shark are caught in nets in something like the way in which herrings are caught in Europe. The net is made of strong English whip-cord, the mesh about 6 inches; they are generally 6 feet wide, and are from 600 to 800 fathoms, from three-quarters to nearly a mile in length. On the average side of the net, about 4 feet in length, at intervals of 6 feet; on the other piece of stone. The nets are sunk in deep water from 80 to 150 feet, well out at sea; they are put in one day and taken out the next, so that they are down two or three times a week, according to the state of the weather and success of the fishing. The lesser sharks are occasionally found dead,—the larger ones much exhausted. On being taken home, the fins are cut off and dried on the sands in the sun; the flesh is cut up in long strips and salted for food, and the liver is taken out and crushed down for oil. The head, backbone, and entrails are left on the shore to rot, or thrown into the sea, where numberless little sharks are generally on the watch to eat up the remains of their kindred. The fishermen themselves are only concerned in the capture of the sharks; so soon as they are landed they are purchased by Bania merchants, on whose account all the other operations are conducted. The Banias collect the fins in large quantities, and transmit them to native dealers at Bombay, by whom they are sold for shipment to China. Not only are the fins of all the ordinary varieties of shark prepared for the market, but also those of the saw-fish, of the dog-fish, and of some varieties of ray or skate. The dog-fish in India has a head very like that of its European congener, from which it differs in all other respects most remarkably. Its skin is of a tawny yellowish-brown, shading from dark brown on the back to dirty yellow on the belly; it is beautifully covered all over with spots, of the shape and size of those of the leopard, similarly arranged. The largest fishery at any given port is probably that of Karachue, which affords nearly one-tenth of the whole, but the shark fishery is conducted all along the Bombay coast.

There are three great fishing villages in Bombay Island, at Worles, Sewree, and Mahim. Their fishing boats are worth about Rs. 550 each, and canoes from Rs. 40 to 60 each. A patamar employs from 15 to 20 men, a fishing boat from 10 to 15, a canoe from 3 to 4. Canoes are chiefly employed in the coast fishing, in attending the men on the mud-banks, and in landing cargo when there is no depth of water sufficient for larger vessels. They are hollowed out of a single log, and are very serviceable, handsome-looking, well-finished craft. They are propelled either by paddles or sails; when the latter are employed, an out-rigger is resorted to; they will bear a surprising stretch of canvas, and make their way rapidly through the water.

The Bombay fishing boat is one of the swiftest and most elegant sea-going vessels of that coast, and can beat the best of the English yachts. See Boats, p. 395.
FISHERIES.

On the western shores of India, nets of various forms and sizes are almost solely employed. The most important is the stake-net fishing in the Arabian Sea, and stakes are often to be found 30 and 40 miles out at sea,—wherever, indeed, a bank within half a day's sail of land presents itself; the fishermen are quite enterprising enough to extend their operations to any distance, but there is no use in their going further off than they can return with their fish to the market fresh. The fishing stakes vary from 50 to 150 feet in length; they are built up of successive pieces of wood, the lower being frequently the long straight trunk of the coconut or palmry tree. As many as 8 stakes, made of wood, from 8 to 10 inches in diameter, are used in the construction of a single stake. They are seared across each other, the searing being from 3 to 5 feet; the pieces are fastened together by strong rectangular fillets of wood. Two or three boats are employed in towing the stake out to sea. Its point is made wedge-shaped; there is a hole near the point of the wedge, through which a rope is passed. The two ends of the rope are made fast to boats anchored at a considerable distance off; other boats now proceed and haul up the upper end of the stake till the point is found to descend by its own weight. When it has once caught hold of the mud, the rope is released from its lower end, and the boats to which it was attached are employed in steadying the top in the direction of the run of the tide. At high water, two boats are made fast, one on each side, to the top of the stake, which is forced by their weight 10 or 12 feet into the mud. Stakes are thus put in successively, often to the extent of some miles at intervals of 20 feet from each other. Betwixt each pair is extended a long purse-net, the circumference of the mouth of which is about 60 feet, so that when attached to the stakes it exhibits an aperture 20 feet across, and 10 feet perpendicularly, the upper edge being a little above high water. The purse is from 100 to 170 feet in length, terminating in a point. The meshes gradually diminish in size from the mouth to the further extremity, being about 6 inches at the former, and three-fourths of an inch at the latter. The fish are carried into this by the tide, and entrapped; boats are always in waiting at high and low water, to secure the capture and reverse the nets. Also, in the creeks and shoals, lines of stakes and nets, often several miles in length, are run along where the sludge is exposed at low water. The upper edge of these is considerably under high-water mark, and the fish are in consequence entrapped by them on the retirement of the tide; breaks are left at intervals to secure their admission. Close along shore, fishing grounds, about half an acre in area or so, and in a semicircular form, are built. An aperture is left in the extremity of each of these, into which a net is placed as the tide begins to recede, and a considerable capture of the lesser-sized fish secured. Such are the fixed implements of the Bombay fisherman. Of the moveable implements, the most frequent is a conical net, of which the lower lip is loaded with pieces of lead and turned inwards. The material of which it is made is fine twine, and the meshes small. It is from 8 to 12 feet in diameter, and is only used in-shore. The fisherman holds it by the top, while he gives it a quick twirl, something betwixt that given to the American lasso and common quoit. Throwing it to the distance of some yards, it spreads fully out as it reaches the water; when pulled down and collapsing by means of the lead, it closes at the mouth as it approaches the bottom. The fisherman now approaches and pulls it up by the apex, when the fish are found enwrapped in it. Though this net sometimes attains a weight of 60 pounds, the dexterity with which it is thrown is wonderful. There are various spoon-nets and purse-nets of different shapes and sizes, and a bag of muslin on a hoop about 3 feet in diameter, this last being used when a number of crabs or small fish of any sort escapes. The mud-banks, and shoals in the creeks abound in eels, sometimes reaching the length of 2 or 3 feet. The fishermen wade through the mud till they detect these by the bubbling up or disturbance of the water. They then strike them with a harpoon or spear, with a fine bamboo shaft 8 or 10 feet in length. Having pinned them against the ground, they draw them out with a hook about the same size as the spear, also on a shaft. They are very dexterous in catching the little fish or crabs which lurk under the stones close by the shore, with their hands. The crabs when caught are immediately stripped of their claws, and so prevented from getting away. Of these there are a wonderful variety on the Bombay shores, many of them of the greatest beauty.

The Bombay fisherman's mooring anchor is generally of stone, from 4 to 5 feet in length, four-sided and pyramidal, the apex cut off. At base it is from 6 to 8 inches square, and from 4 to 6 at top. Through the top is a hole, through which a cable or hawser passes. Near the base are two holes at right angles to each other. Through these pieces of wood are thrust, corresponding to the prongs or flukes of the anchor. The whole weighs from 80 to 150 lbs., according to the size of the vessel, and answers very well the purpose intended.

The Bombay fishermen are a strong-made race of men, and are the only labourers in India amongst whom a great degree of obedience is observed. They are much given to the use of intoxicating drinks. A set of boats and nets belong to a dozen or so of fishermen, one often advancing the capital required to be contributed by the others; the capture is divided amongst them on their reaching the shore, and is immediately taken charge of and carried to market by the women, who carry their baskets on their heads. The men, when so employed, carry theirs in baskets swung at the opposite ends of a bamboo across the shoulders. The women who carry the fish to market are commonly followed by ten or a dozen crows, who constantly watch for anything that may escape, every now and then making a dash at the basket itself.

1120
FISHERIES.

E. insidiatrix, Bloch, Atherina Forskalii, Ruppell, and species of Ambassis, Polynemus, Hemiramphus, and Chato don are dried and largely exported to the interior. Of the better known salt-water fishes of a wider geographical distribution, such, for instance, as are brought as articles of food, at the three distant points, Calcutta, Madras, and Bombay, the market of the first is the least rich in varieties, in consequence of its greater distance from the sea. The abundance of the supply, however, makes up for what it wants in variety, and the large demand for fish affords a livelihood to great numbers of fishermen, who every night spread their nets in the river and in the salt-water lake. The Latea nobilis, different species of Polynemus, and the Mugil corsula, daily cover the tables of Europeans, who will more readily recognise these fishes under the names of the bogu or cockup, sudjeh, tapbi (mango fish), and the Indian mullet. At the Sandheads are to be found some of those delicious fishes which are more familiar to the residents of Madras and Bombay,—for instance, the Indian sole, the rollfish, and above all the black and white pomfrets and the bummalo or Bombay duck. Of these, the Indian sole is most largely distributed, being common in the Straits of Malacca, the Bay of Bengal, the Persian Gulf, the Red Sea, and also at the Cape of Good Hope.

The Sunderbuns sea fishery is carried on to a very small extent, chiefly because the distance to Calcutta is too great to allow of the carriage of fish in a fresh state. The only class of fishermen who have sea-built boats inhabit villages situated near the entrance of the Hoogly. Their chief and most profitable employment consists in attending with their boats on the shipping entering and leaving the river, for which they receive 16 rupees per diem. Whenever this employment fails, they resort to work with their nets, which they drag during high water along the coasts of the Sunderbuns. Two or three times are, generally speaking, sufficient to load a boat with fishes and shell-fish, a truly prodigious quantity being brought up in a few hauls. The larger portion of the fish and shell-fish is dried, while the cod or saclolli enters the mouths of the Ganges in shoals. The kharra, or Indian mackerel, a species of Scomber, is rather uncommon in that estuary; but from the Burmese coast great numbers in a dried state are annually imported into Bengal. The cartilaginous fishes abound in numbers and species, and are remarkable for their wide geographical distribution. The sharks enter the rivers to a considerable distance from the sea, and shark skin is used by the native workmen for polishing wood and ivory, while the shark fins are largely exported to China.

The bazaars in Calcutta are always stocked with an ample supply of dry fish, which is consumed partly by the European and native shipping of that port, and partly by the poorer classes of Bengal and the Upper Provinces. Cargoes of this article are annually transported to the Burmese and Arab ports. These dried fishes consist chiefly of the bummalo, which sells in Calcutta at the rate of four or five rupees a hundred, in Indian mullet, the sudjeh, the begti, and the kharra or Indian mackerel. The demand for dried fish exists along the coasts of the Peninsula. At Bombay large quantities of the bummalo are consumed and exported. At the mouths of the Indus the fishery is extensive; and some fish sounds are there procured from a Science, but they may also be those of other fish, as the fish maws are very different in form from the isinglass sent from Bengal. Dr M'Clelland in his paper called attention to the very important subject of increasing the supply of fish in the interior of India. Wherever there are any large pieces of water for the purpose of irrigation, as in the Peninsula of India, these he conceived might support quantities of fish, if proper kinds were selected, and pains taken to destroy the injurious animals, in the season when the water is sufficiently low for the purpose. He also suggested that at the different sanatoria which have been established in the mountains, it would be desirable and easily practicable to form riviria, which would at all times yield a supply of fish. This might be done by damming up a portion of some of the valleys through which the mountain streams pass.

On the Madras side, where a boisterous surf beats for ever on the shore, the fishermen use the catamaran and fishing lines, but nets are also largely used; and when shoals visit the coast, great bag-nets several hundred yards long are thrown from man-of-war-boats. The catamaran of Ceylon and the Coromandel coast carries two and three fishermen, and, with a sail set, they take advantage of the land and sea breezes to fish several miles from land, returning home about sunset. Every river is exhaustedly searched by the nets of the land fishermen.

Further India.—The great Irawadi river, and the seas in which the Mergui and E. Archipelagos are enclosed, abound in fish, and the Malay shoot their great stake nettings far into the ocean. The shallows between Penang and Province Welsey are covered with such nets. The wealth of these eastern rivers and seas is boundless.

The fishermen supplying the markets of Penang and Singapore are principally natives of China. Their fishing boats vary from one to three tons burden; they are of a slight make, and calculated to ply at short distances from the shore. They are propelled by oars, and seldom carry sails. The nets are made of twine, tanned with mangrove bark. The bamboo fishing-stakes are clumsy contrivances. That they answer well enough in fine weather, is more owing to the riches of the sea and their sheltered position, than to the ingenuity of the contrivance, or the durability of the materials. In nautical skill the Chinese fishermen of the Straits Settlements are far behind the Malays. The fishmongers are natives of China, but they form a class far superior to the fishermen. Their trade comprises the branches of fresh fish, dried fish, isinglass (fish maws), fish roes, red fish, sardinae, sharks' fins, balachan, fish manure, and trepang. The fishermen dispose of their boat-loads to the fishmongers, who assort the different kinds in heaps, over which sea-water is continually poured, and from these the daily customers are supplied. Comparatively few varieties of fishes appear on the tables of Europeans, but Malays and Chinese reject but very few kinds. The daily surplus fish are cured by the fishmongers. The process commences with a partial abrasion of the scales, after which the larger fishes are opened lengthwise, and gutted. Water is repeatedly poured over the fishes, till blood and impurities have
disappeared, when they are placed in casks in the layers, between which is thrown a quantity of salt. In this state the fishes remain from 24 to 48 hours, when they are exposed to the sun, and frequently turned, till they are thoroughly dried. The smaller kinds are not opened, nor are they all salted before drying in the sun. The little care bestowed upon the curing appears, however, to be sufficient for local consumption, and none of the settlements in the Straits export dried fish. The pikul of 133½ lbs. sells from 3 to 7 Spanish dollars, valued at 4s. 6d.; the catty being 1¼ lb., of which 100 go to the pikul.

Mr. Crawford, after stating that the fisheries of the Indian islands form a most valuable branch of their commerce, and that a great variety of the fish caught are dried in the sun, observes that fish maws, shark fins, and trepang are sent to China in large quantity. The trepang, swala, or beche-de-mer, often called sea-slug, one of the tribe of Holothuria, is an unseemly-looking molluous animal, which constitutes in quantity and value one of the most considerable articles of the exports of the Indian islands to China. There are fisheries of trepang in every island of the Indian Archipelago from Sumatra to New Guinea, and not less than 8000 cwt. were yearly sent to China from Macassar, the price ranging from 8 Spanish dollars per pikul to 20, and as high as 115, according to the quality. The same author states that shark fins are exported to China from every maritime country between the Arabian Gulf and the East Indian Islands. A pikul of shark fins usually sells in China as high as 32 Spanish dollars or £6, 1s. per cwt.; which high price makes it evident that they are only articles of luxury, the use of the rich. In the market of Macassar the ordinary price is about 15 Spanish dollars or £2, 16s. 8d. per cwt. Fish maws often bring as high as 75 Spanish dollars per pikul, or £14, 3s. 6d. per cwt., in the market of Canton.

Fish Traps in the Archipelago are made of basket-work, are baited with small fry, and afterwards sunk by means of stones, their position being indicated by long bamboo fishing- buoys.—Earl, p. 37.

Sharks' Fins of commerce are not, however, exclusively selected from sharks (Squali), but equally from rays (Raihe), and at Penang composed of the genera,—Stegostoma, Carexrias, Sphyra, Priatis, Shinobius, Trygon, and Myliobatis. Of all fishes, sharks and rays are the most valuable to Chinese. The flesh and entrails of all, not even the electric rays (Torpedinidae) excepted, are eaten either fresh or dried; the skin is used for polishing or converted into shagreen; gelatine is obtained from the larger fins, glue from the smaller. All except the caudal fins are cut at the root, so as to leave as little flesh as possible. The root is dipped in wetted lime (chumam), then dried in the sun, and packed promiscuously in gunny bags, each containing from one half to one pikul. According to the value in the Chinese market, the fishmongers sort the fins in two kinds, white and black. The white consist exclusively of the dorsal fins, which are on both sides of a uniform light colour, and reputed to yield more gelatine than the other fins. In China the lovers of gelatineous soups pay from 80 to 40 Spanish dollars per pikul of white fins. The pectoral, ventral, and anal fins pass under the denomination of black fins. The colour, however, varies according to the species from buff to grey or brown, and most of them are of two different colours, the upper surface being dark, the lower light. The black fins, for obvious reasons the most numerous, are supposed to yield a comparatively small quantity of gelatine, and sell in China at from 15 to 20 Spanish dollars per pikul.

In China, at least one-twentieth of the river and seaside population derive their food from the water, and much ingenuity is shown. Nets are woven of hempen thread, and boiled in a solution of gambier (Uncaria gambier) to preserve them from rotting. The fishing smacks which swarm along the coast go out in pairs, partly that the crews may afford mutual relief and protection, but chiefly to join in dragging the nets fastened to their boats. In the shallows of rivers, rows of heavy poles are driven down, and nets secured to them, which are examined and changed at every tide. Those who attend these stake-nets, moreover, attach to their boats scops or drag-nets, so loaded that they will sink and gather the sole, ray, and other fish feeding near the bottom. Lifting nets, 20 feet square, are suspended from poles elevated and depressed by a husker worked by a windlass on shore; the nets are baited with the whites of eggs spread on the meshes. Cornorants are trained in great numbers in the eastern provinces to capture fish, and are sometimes under such good order that they will disperse at a given signal, and return with their prey without the precaution of a neck-ring. A single boatman can easily oversee twelve or fifteen of these birds; and although hundreds may be cast out upon the water, each one knows its own master. If one seizure is found too heavy for it alone, another comes to his assistance, and the two carry it abroad. The birds themselves are fed on bean-curd, and eels or fish. They lay eggs when three years old, which are often hatched under barnyard hens, and the chickens fed with eels’ blood and hash. They do not fish during the summer months. The price of a pair varies from five to eight dollars.

Shell-fish and molluscs, both fresh and salt, are abundant in the Chinese market. Mussels are caught in small cylindrical basket traps, attached to a single rope, and floated with the tide near the bottom. Oysters of a good quality are common along the coast; and a species of Mactra, or sand clam, is fished up near Macao. The Pearl River affords two or three fresh-water shell-fish, of the genus Mytilus, which are obtained by dredging. The prawns, shrimps, crabs, crawnish, and other kinds of crustaceans are not less abundant than palatable; one species of crawfish, as large, but not taking the place of the lobster, called lang hai or dragon crab, cuttle-fish of three or four kinds, and the large king crab (Polyphemus), are all eaten by the Chinese, though not relished by others. On the Chinese coast, several species of Serranus (as Electropoma susuki, Serranus shihpan, etc.), generally called shipman by the natives and garoupa by foreigners, are common about Macao, and considered the most delicate-flavoured of any in the markets. Another common and delicious fish is the Polynemus tetractys or bynni carp, usually called salmon by foreigners, and sugar is prepared from its skin. The pomfret or stann-gyu of the Chinese
(Stromateus argenteus) is a good pan fish, but not so delicate as the sole fish, many species of which abound in the shallows of the Bogue. Two or three species of mackerel, the Sciaena lucida, an Ophiocheilus, the mullet, the white rice fish, and a kind of shad, complete the list of good table fish found in the markets of Canton.

The Chinese fish-catcher is to be seen, perfectly naked, half-walking, half-swimming. His feet warn him that a fish is at hand, and they feel for it amongst the mud at the bottom of the pond. The next moment the fisherman is under water, and he remains so long that you think something has happened to him. A few seconds more and he appears, rubbing his face and eyes with one hand, and in the other triumphantly holding up the fish which he has just captured. It is immediately placed safely in his basket, and the work goes on as before. The surface of the water is struck and splashed, in order to frighten the fish which are swimming amongst the feet of the Chinamen. Being frightened, they dive immediately to the bottom amongst the mud, where they are felt by the feet, and soon taken by these expert divers.

Fishing boats of China are under strict regulations, and all are licensed. Casting-nets are used by the poorer class of fishermen. They also use a dip-net. Anchoring the boat, the net is lowered, and the fisherman has large cork balls, to each of which several baits are attached. These are thrown beyond the net, and as they float towards the boat are followed by multitudes of fish, and the net is raised to capture them. They use, also, drag-nets between two ships. A small boat, painted white, is kept with its gunwale low in the water of the Canton river, into which the fishes leap on being disturbed. The night fishing of the Chinese is carried on in long narrow boats called pa-pak-teng. On one side there is a long white board, a foot broad, running fore and aft, and inclining towards the water. Amidships, a stone, which is made fast to the boat by means of a cord, is lowered into the water, the boat is paddled by a man in the stern, and the stone in the bottom of the boat gives a rushing noise which alarms the fish, and, seeing the reflection on the white board, they jump towards it, and nine times out of ten overleap it and fall into the boat.

Large quantities of fish are reared artificially in China, at Tai-shick, Lee-chun, Sai-chu-shan, Kow-hong, Kum-chok, and other places. In March and April the spring tides bring great quantities of fish up the rivers. The spawners deposit their ova among the long grasses or reeds growing on the banks, and in a few days the fish are hatched, are captured by nets, and placed in well-boats, where they are fed with paste made of wheat flour, bean flour, and the yolks of eggs. When they grow large they are placed in artificial ponds of shallow water, with rockeries and the banana and vine trellis work, the foo-lin-tree and water-lilies, for shade and shelter. Sometimes stone walls enclose the ponds on all but the north side, which is left open. Pigeons are not kept where fish are thus reared, and the willow tree is not cultivated. The fish are fed with grass twice daily during summer. The Bulletin Universal for 1839 mentions that in some parts of China the spawn so taken is carefully placed in an empty egg-shell, and the hole closed; the egg is then replaced in the nest, and, after the hen has sat a few days upon it, reopened, and the spawn placed in vessels of water warmed by the sun, where it soon hatches.

Of other two productions of the eastern sea, naked cephalopods are not only eaten fresh by the Chinese, but one species, a loligo, forms in its dried state a considerable article of traffic. The preparation consists in removing the ink-bag without laying open the mantle. After all impurities have been removed by water, the mollusc is submitted to a slight pressure, and ultimately exposed to the sun. Small bundles of one catty weight are tied up with slips of rattan, and enclosed in cases holding ten catties and upwards. The pikul sells at the rate of 14 to 16 Spanish dollars. Chinese fishermen, when they take one of those huge rhizostoma which abound on the coast, rub the animal with pulverized alum to give a degree of coherence to the gelatinous mass.

Fish Mannur.—The smallest fishes and all offal are employed in the sedge plantations by the Chinese gardeners and agriculturists of Penang, and they consider the fluid in which fishes have been salted very useful as a cure for all plantations.

In Borneo, in the enclosures of stakas, drag-nets, casting-nets, traps, placed so as to swing to each tide, and hook and line are largely used; prawns, shrimps, and small fish are taken with hand-nets in the fine season. The quantity of fish taken by these various contrivances is enormous. They are salted and dried, and sent into the interior of the country. The river fish in general are not so much esteemed as those taken at sea, though they also are frequently caught, principally by means of hooks and lines attached to the light wood called plye, cut into the shape of birds. These may frequently be seen floating down with the tide, to each of which is attached at the neck a strong line supporting a baited hook. The proprietor is generally not far off, and on the float bobbing under water soon seizes it. A fine fish, called in Borneo,ikan malang, is the one most frequently caught in this manner. Several light, porous woods, such as Gyracarpus Jacquinii, Sal-malia Malabarica, and the fruit of the baobab, are used as floats for fishing-nets.

In Formosa fishermen use a sunken dip-net, into which surrounding boats drive the fish by beating the water with long poles. Where dip-nets are used, live fish are held by cords to serve as decoys.

High Asia.—No trout or salmon inhabit any of the rivers that debouch into the Indian Ocean. This widely-distributed natural order of fish (Salmonidae) is, however, found in the Oxus, and in all the rivers of Central Asia that flow north and west; and the Salmo orientalis, M'Celland (Calcutta Jour. Nat. Hist. iii. p. 283), was caught by Mr. Griffith (Journals, p. 498) in the Bamian river north of the Hindu Kush, which flows into the Oxus, whose waters are separated by one narrow range of mountains from those of the feeders of the Indus. The Central Himalayan rivers then rise in Tibet from lakes full of fish, but have none (at least during the rains) in that rapid part of their course from 10,000 to 14,000 feet of elevation; below that, fish abound, but, it is believed, invariably of different species from those found at the sources of the same rivers. The nature of the tropical ocean into which all the Himalayan rivers
debouch, is no doubt the proximate cause of the absence of Salmonide. Sir John Richardson (Fishes of China Seas, etc., in Br. Ass. Rep. etc.) says that no species of the order has been found in the Chinese or Eastern Asiatic seas.

Raw dried split fish are abundantly cured (without salt) in Tibet; they are caught in the Yaru and great lakes of Ramchoo, Dobiah, and Yarbru, and are chiefly carp and allied fish, which attain a large size.—Llew Sarawak; Cal. Journ. Nat. Hist.; Crawford; Dr. Buist in Bombay Times; Sir J. Richardson in Rep. B. Ass.; Williams' Middle Kingdom; Hooker's Hist. Journ.; Fortune's Residence; Fortune's Wanderings; Dr. F. Day in M. Med. Journ., On the Migratory Fishes of Asia, On the Obliquity of the Eyes in Flat Fishes, On the Colours of Fishes, On Indian Fresh-water Fishes, On the Sea and on the Fresh-water Fishes and Fisheries of India; Grey's Chin; Montgomery—Cantor; Bend. As. J.

FISHERMEN. On all the sea-coasts of the south and east of Asia, and on the great rivers, the people are fishermen. There is something remarkable in the circumstance of the fisher races being amongst the earliest and most eager converts to Christianity in India, so much so as to render it questionable whether it be only an accidental coincidence, or the result of some permanent and predisposing cause. Along the coasts at Madras many became Christians early; indeed, from the southern outskirt of the town at St. Thomé to its northern village of Ennore, nearly all the fishermen are Christians of the Romish persuasion. The Koli tribe of fishermen in Bombay are nearly all Christians, though they have occasionally wavered. The Parawa, or fishermen of Cape Comorin, were the earliest proselytes of St. Francis Xavier, and they have still a pride in alluding to the fact that they were the first, as they have since been the most faithful and abiding, of his converts. It was by the fishermen of Mannar that he was invited to Ceylon in 1544; and notwithstanding the martyrdom inflicted by the raja of Jaffna, and the persecution with which they were visited by the Dutch, that district and the adjacent boundary of the Wanny has to the present day been one of the strongholds of the Roman Catholics in Ceylon. It is amongst the Parawa or fisher caste of the Singhalese that the Roman Catholics have at all times been most successful in their efforts to Christianize.

The Zamorin, in 1513, sent a deputation to Portugal, his ambassador, who turned Christian, was knighted under the name of 'John of the Cross' by John III. On his return to India, he was banished from the Zamorin's court as a renegade. In 1532 he joined the fishermen, and headed a deputation of 85 of them to Cochin, soliciting the assistance of the Portuguese against the Mahomedans. The whole of the embassy are said to have become converts to Christianity. A Portuguese fleet was sent to their relief, and 20,000 are reported to have immediately consented to be baptized. Ten years subsequently, Xavier instituted a church for these people.

The fishermen race along the Bombay coasts are divided into four great castes,—Watttree, Son-koli, Dongur-koli, Thankur-koli, over each of which a headman or jemadar presides. One great jemadar or chief rules supreme in the craft over all these fisher castes.

The sea fishermen in most parts of the coasts of India assert that in olden times they were divided into those who captured fish in the deep sea, and others who fished from the shore and in the backwaters and creeks; but in several parts of India, more especially in the Madras Presidency, they have customs of a patriarchal nature, but which are more strictly observed on the Coromandel than on the western coast. In Sind there are four divisions of the fisherman caste, each being under its own chief, who is hereditary, and his business is to settle caste disputes and other trifling matters, also to conduct the religious ceremonies connected with marriages and deaths. In the Bombay and Madras Presidencies headmen to the fishing castes likewise exist; in some localities they are hereditary, in others elective; or should there be no headman, matters are left to be decided by certain wealthy individuals of their own caste, whose decision is final. In places where the fishermen are Christians, the priest appears to be appealed to in order to settle disputes.

Among the fishermen of the Peninsula there exist priestly chiefs, two of whom are to be found on the eastern coast, one at Madras, and the other at Cuddalore, the territory of the former stretching up the Coromandel coast, while that of the latter reaches towards Cape Comorin. A third is found in South Canara, where he exercises spiritual control over a large district. These chiefs' offices are hereditary; they receive fees and fines from those of their caste living within their jurisdiction, and they are the final referees in all cases of caste or family disputes. A class of more petty chiefs or hereditary headmen only hold sway over a few individuals; their duties are the same, and some of their fees seem to have to be transmitted to their superior. On one of these headmen dying without heirs, a new one is elected by the people of the caste. Lastly, the fishermen have the elective headman, who is chosen by the residents of a single hamlet; his duties are to decide disputes, to be present at marriages and religious ceremonies, often to fix the work and assist in certain Government duties; his emoluments appear to be very trifling.

Along the western coast of the Madras Presidency, with its untaxed salt earth, these people prosper; but all up the Coromandel coast, except where there are large towns, we find them reported to be decreasing in numbers, due to cholera or other diseases, emigration, or accepting service as lascars in coasting vessels.

The fisherman in Sind, in 1875, paid a tax of 10s. a ton yearly on their fishing boats. These people are well off. In Gujerat the fishermen are poor, and the precarious living they make often induces them to accept service as sailors, labourers, or anything that ensures them a steady competence. They are in the utmost misery, not due to their own laziness, but as a result of British legislation imposing prohibitory duties on salt, and causing an enormous loss of food to the inhabitants at large. In the Janjira district the fishermen supply themselves with boats and nets; six or ten club together to obtain a boat and net, dividing the produce; here they have decreased in numbers. At Broach and Kaira they have diminished. In Ratnagerry they are said to have increased.

In the Timefully collectorate the fishermen as
FISH HOOKS.

the rule are very poor. They work by a system of advances made by traders, a few of whom reside in each fishing village, and supply all the requisites for fishing, as well as the boats, taking one-third of the captures as their share. In the Nellore district the inhabitants of the different villages prevent fishermen from other localities plying their occupation within what they believe to be their limits. At Cannanore the owners of fishing boats and nets supply them to the fishermen. A like plan obtains at Tellicherry, where the fishermen have framed rules for their own guidance, one of which is the right of the first discoverer, among a lot fishing together, to a shoal of fish; he is allowed to capture them without hindrance from the others, even though at the time when the fish were discovered he was not prepared to launch his net. At Ootepadram the native official estimated the daily earnings at threepence, taking all the year round, and excluding costs; and at Mannurje from three-halfpence to ninepence; while at Tenkareli their earnings were computed at from threepence to one shilling a day.

Without pretending to state the condition of these people in each district, it will be sufficient to say that they are poor and miserable, but not so badly off as in the Bengal maritime districts, where they appear to be quite poverty-striken.

The chief cause of this impoverished state is undoubtedly the hampering in their avocation, occasioned by the salt monopoly, which restricts their traffic to the sale of fresh fish, sufficient merely for local consumption. In India, also, on the sea-coast, it is aggravated by the caste customs preventing the fishing races taking to other avocations. Passing on to Burma with its cheap salt and freedom from caste, we find the fishermen well off.—Tennent’s Christianity in Ceylon; Day’s Fisheries; Bombay Times, 1580.

FISH HOOKS.

Hamecon, P. Panching, MALAY.
Fischangel, GER. Gallamu, TEL.
Gal, MALAY. Anuelle, SP.
Kall, Kai, MALAY.

Fish hooks are used in all countries, but in the S. and E. of Asia, nets, traps, and stakes are the generally adopted modes for catching fish.

FISH INSECTS are species of Lepisma, pretty little silvery creatures, found in brooks. L. niveo-fasciata, Templeton, and L. neger, Templeton, occur in Ceylon and Malabar. The genus was called Lepisma by Fabricius, from its fish-like scales. It has six legs, filiform antennae, and the abdomen terminated by three elongated sets, two of which are placed nearly at right angles to the central one. Lineeus states that the European species was brought in sugar ships from America. The chelifers found in Ceylon has been brought thither from Europe.—Tenn. Sk. Nat. Hist. of Ceyl. p. 476.

FISH MAWS, Fish Sounds, Air-blower, Swim. Singally, Sozilly, ENG. Sozilly (small), GUZ, HIND., Loopa-100-pa, CHIN. Palapong ukan, MALAY. Poa (large), GUZ, HIND. Ari, ARI IAN.

Are terms applied in oriental commerce to the air-blower, sound, or swim of fishes. It is an article of luxury with the Chinese, and forms an important article of export from all the S.E. coasts of Asia. Small quantities of the superior kind are occasionally sent to England, from which it is supposed isinglass is made. There are two kinds of fish maws in Bombay, the poota and sozili, the difference consisting merely in the size,—the latter being about one-fourth the size of the former. They are of yellowish tinge, and are cured by stretching them in the sun. If they become damp, they soon decay and are then worthless. They are brought to China in junk from the Indian islands. At Singapore and in China the price is from 35 to 70 dols. per pikel, and, together with birds’ nests, beche-de-mer, and sharks’ fins, are consumed by the Chinese for their supposed strengthening and restorative properties. That the fish maws are isinglass, appears to have been the discovery of an anonymous correspondent in that Parbury’s Oriental Herald for January 1839. The fishes from which isinglass is obtained at Penang are,—Lates hypostomus, Ikan siyakup; Polyenium Indicus, Ikan kurow; Otolithus biarius, Ikan salampe; O. ruber, O. argenteus, O. maculatus, all called Jarang gigi; Johnius diancathus, Ikan tumbarch; Lobotes erate, Ikan batu; Arius truncatus, A. arius, A. militaris, all called Ikan salatul. Their export from British India, from 1857-58 to 1860-61, ranged up to 1,002,624, value Rs. 90,620; and in recent years—

The air-blowers of fishes that swim near the surface are small, and are wholly absent in those which, like the flat fishes (Pleuronectidae), live near the bottom.

FISH OIL manufacture is carried on all along the western coast of India. The great source of supply is the shark and the skate. The livers of these are cut out, and thrown into a vat or old canoe or other receptacle, and trodden on with the feet till the oil is expressed. It is then drawn off, and stowed away. The oil from the variety of skate called Wagil by the natives of the Bombay coast, seems to have a strong resemblance to cod-liver oil. On the Malabar coast, especially to Villa, the seal literally swarms, and a great variety of the skate—two or three, ill-smelling kind of oil, which sells for from six to twelve annas a maund, is manufactured from these. The natives employ it for smearing their boats. The liver of the white shark is that generally used. The mode of preparing the best cod-liver oil is equally applicable to fish liver. The proper season for preparing cod-liver oil is early in January, when the livers are plump, firm, large, white, and full of oil. The livers are sometimes found diseased, and such as are specifically lighter than water should be rejected. Good livers should cut smooth, and not tear; when cut, none of the substance should flow out in a half-liquid state. The quantity of oil produced by livers depends much upon the time of the year. In the beginning of January 1000 livers were found by experiment to yield 37 imperial gallons, and at the end of February an equal number only gave 23 gallons of oil. In the beginning of January 1000 livers of average size weighed 900 lbs., whilst in the last day of March the same number weighed only 575 lbs. The oil at these different seasons was equally pale, and the livers equally white, although much smaller and more flabby in the latter season. To prepare the oil, wash the livers very carefully,
first removing the gall-bladders which adhere to them, and infuse them in rain or other water free from salt. Place them over the fire, and never allow the temperature to exceed 120° or 130°. On this head special care must be taken; a higher degree of heat, although yielding a larger product, communicates a rank, fishy taste and smell, and heightens the colour of the oil, thereby rendering it disgusting to the patient.—M. E. J. R. of 1855.

**FISH ROE.**

Matchi ke unde, . DUKH. | Choppa janna, . TELE. 
Min chenney, . TAM. | Trubu, . MALAY.

Fish roe is sold in every bazar of the S. and E. of Asia, and the fish roe of Siam is a great article of trade.

Fish Roos, Red Fish, and Saritines are Malay condiments, and the species of fish used in their preparation are Alasum toli (Ikan truboh), Engraulis Brownii (Bunga ayer or badah), Dussouvieria acuta (Tamban-bulat), and Clupea perferans (Tamban-ini-nepe or batul). Balachan or gun-pi is a condiment prepared from small fishes of all descriptions, and shell-fish. The ingredients are placed in a pit to undergo fermentation, and afterwards dried, pounded, and preserved with spices. With the Malays, Siamese, Burmese, and Cochín-Chinese, balachan has become a necessary of life, as it serves to season the daily food of these nations.

**FISH SKINS, Fiel de pescado, Sr., are used occasionally in India for covering scabbards. The Goldi, on taking a large fish, remove the skin and beat it with a mallet to remove the scales and until the thick, oily corium becomes supple. In a dress of this kind they defy snow, mist, and rain.—Latham’s Nationalities of Europe, p. 271.

**FITCH.** The best Aph Pitch, a London merchant, travelled through India and Burma about 1833–91, in the reign of Queen Elizabeth, along with another London merchant named Newberry, and accompanied by a jeweller named Leedes and an artist named Storie or Storey, all at the charge of Sir Edward Osborne and Mr. Richard Staper, two rich London citizens. They travelled through Syria to the Persian Gulf, and then the Portuguese imprisoned and sent them to Goa as interlopers. Storie adopted the Romish faith, and settled at Goa, marrying a half-caste; but the others were ultimately released, and travelled to Golconda, and through Berar and Rajputana to Agra, where Akbar was ruling. Thence Newberry returned, via Lahore, Afghanistan, and Persia, to England. Leedes appears to have settled at Agra in Akbar’s service, and Fitch sailed in a fleet of 31 boats down the Jumna and Ganges, passing Allahabad, Benares, Patna, and Gour, to the Bay of Bengal, visiting also Koch-Bahar, thence to Orissa, and finally, in November 1586, to Burma, in a small Portuguese vessel. He returned to England in April 1591. With the extensive information regarding the wealth of the countries they had visited, the general current of enterprise ran so vehemently towards India, that in 1589 some London merchants applied to their Government for the royal permission to send three ships and the same number of pinnaces on a voyage to that country. This was granted towards the end of 1600, and they formed amongst themselves a chartered association, under the style and title of the Governor and Company of Merchants trading to the East Indians, which was the origin of the East India Company. Their first factories were formed at Surat, Ahmadabad, Cambay, and Gogo.—Fytche’s Burmah.

**FITZCLARENCE, Lieut.-Colonel,** author of Journal of a Route across India through Egypt, to England, in 1817 and 1818, 4to, London 1819.

**FITZGERALD, Captain,** with three troops of Bengal cavalry, successfully charged the Maharrats at the battle of Kamptee in 1817 against Apa Sahib. He had been ordered not to advance against the enemy, but, seeing his small party being hemmed in, he sent asking permission, but was forbidden to charge at the peril of his commission. "By heaven, we'll charge him!" he exclaimed. The Hindu troopers, taking a handful of earth from their syces, threw it over their heads, the Mahomedan troopers shouted their usual warcry, "Deen! Deen!" For the faith! For the faith! and, spurring on, they captured two guns, which they turned on the enemy and mowed them down in heaps. This successful charge turned the tide of battle.

**FIUMARA.** In Italy, a hill watercourse, which rolls a torrent after rain, and is either partially or wholly dry during the drought season. It corresponds to the Indian nullah. —Burt, Mecco.

**FIVE, Panch, HIND.** is a number of frequent occurrence amongst Hindus. Panch-salar or Kansali, the five artisans; Pancha-junya and Pancha-kshiti in the Veda, five families, according to Lassen; Panchayat, a jury of five. The panch liquor and Panch of Panch and Judy are said to be from Panch, five. The five items of panch were arrack, sugar, water, rose-water, and fumes; the five of Panch and Judy are Panch, Judy, the dog, the constable, and the devil. The English word five comes from the Greek πέντε, Panth, the upraised hand. Ten is one upraised hand and one reversed, and, with digits prefixed or suffixed, up to 49 are indicated. The almanacs of the Hindus include Panch-anga, five sections, viz. the lunar day, the solar day, the lunar asterism, the conjunctions and transits of the planets, eclipses and the karana or subdivisions of the lunar day. Five mountains are sacred to the Jains, viz. Abu, Girnar, Palitana, and Tallija in Saurashtra, and Sakur in the east.

**FLACOURTIA INERMIS.** A natural order of plants. 18 species of the genera FLACOURTIA and Phoberos occur in the S. and E. of Asia. F. Obcordata is a shrub of Chittagong and Sylveth, F. rotundifolias of the Peninsula, and F. Campbelliana of Sumatra.

**FLACOURTIA CATAPHRACTA.** Rozb. Taliupatu, . HIND. | Talishapatri, . TELE. Paniiha, Panpia, .

A tree of Assam, Monghir, and Nepal, grown as a fruit-tree in gardens at Kotah, and averts a popular medicine in Behar. The small leaves and shoots resemble rhubarb in flavour, and are used as a gentle astringent in the dose of half a dram in powder. An infusion of the bark in cold water is also employed as a remedy in hoarseness. The young shoots and leaves are considered astringent and stomachic. The berries are edible.—Rozb.

**FLACOURTIA INERMIS.** Rozb. Lovi lovi. 

**SINGH.** Grows in Ceylon, in both the Peninsulas of India, in Sylveth, and in the Moluccas. It has minute greenish flowers. In the Moluccas it is extensively cultivated for the sake of its fruit, which makes excellent tarts, though too sour to be eaten raw.—Rozb. ; Voigt.

1126
FLACOURTIA MONTANA. Graham. Ram tambut, Uttuck, Main. A tree common in forests above and below the Bombay Ghat, but does not extend inland. The wood is rather strong and close-grained, but the girth is never such as to render it sufficient for general purposes of carpentry or building.—Dr. Gibson.

FLACOURTIA SAPIDA. Roxb.

F. Ramonchel. L'H.

Booech, ... BENG. | Oogorrasa, ... SINGH.

Binecha. ... DUKH. | Peda kanaregu, ... Tel.
Kuku. ... HIND. | Peda caneaw, ...
Kangar. ... FLAV. | Naka neredu, ...

A small-sized tree or large shrub, growing to an elevation of 1500 to 3000 feet in the central province of Ceylon, also in Peninsula India, and on the Godavery, in Ganjam and Gumsur, also in Bengal and northwards to Dobra Doon. It yields a very hard, close-grained wood, which does not warp, and is worthy of attention. This wood is burned by Hindus when libations are offered for a person who has died on an inauspicious day. It is found as a large shrub along the lower hills of the N.W. Himalaya, sometimes to 3500 feet, in the Salt Range, and on the skirts of the Suliman Range, etc. The timber is there occasionally employed for ploughs, but is too small for most purposes. The fruit about Callcuta grows to the size of a common plum; it resembles a gooseberry, the skin thin and shining, and of a purple appearance. It contains from 10 to 12 seeds, is both palatable and wholesome, and well worthy of more general cultivation.

FLACOURTIA SEPIARIA. Roxb.

Juthe karande, ... DUKH. | Canrew, Sottakia, TAM.
Khatui, Dajkar, ... HIND. | Sambli, ... SANSK.
Shawarwani, Ynq, ... HIND. | Ranaregu, ... Tel.
Kuru mooll, ... MALEAL.

This shrub grows in Ceylon and all over India, up to the Salt and Suliman Ranges. It has strong spines, preventing cattle browsing the leaves. Its fruit is small, hard, and insipid.—Thur.; Stewart.

FLAGELLARIA INDICA. Roxb.

Ban-chunda. ... BENG. | Har charrul, ... HIND.
Myouk kyeing. ... BURM. | Poinee pootee, ... Tel.
Panawbu-vu, ... CAN.

A long, straggling, scendent perennial plant, a native of forests; flowers during the beginning of the rains in June. It is easily recognised by the tendrils it puts forth at the end of its leaves.—Mason: Roxb.; Fl. Ind. ii. p. 154.

FLAME OF THE FOREST is Izora coccinea, Linn. Flame tree or fire tree of Australia, King George's Sound, is the Nuytta floribunda. The flame tree of Illawarra in Australia is the Brachychiton acerifolium, which grows to 60 or 70 feet, and has large racemes of bright red-coloured flowers. Its wood is soft and spongy, and its bark is made into nets and fishing lines.—G. Bennett, p. 554.

FLAMINGO, or Raj-hans, the Phoenicopterus roseus of Pallas, a splendid bird, found in most parts of India. The Singhalese have been led, from their colour and their military order, to designate them the English soldier birds.

FLANNEL. Looi, HIND. This woollen article is wholly imported into India; there is no similar woollen stuff manufactured in S. and E. of Asia, the nearest fabric being the Rampur chadar. It is not much used by Asiaties.

FLAX.

FLAX. Linnen. A plant of the Linum genus, with square stem, and small white flowers, and is extensively grown in Europe and America. It yields two articles, namely, the plant itself, and what is called flax meal. The flax meal is the husk of the plant, which is made into flour, and is used by the peasants of France and other parts of Europe, for the manufacture of bread. The plant is a hardy one, and requires no particular care, and is easily propagated by sowing the seeds broadcast in a good soil. The flax is a native of Europe, and is cultivated in various countries, as in Russia, Sweden, Norway, Denmark, Prussia, and other parts of Europe. The flax is also grown in America, especially in the northern states, where the climate is mild and the soil fertile. The flax is a valuable article of commerce, and is extensively used for the manufacture of linen, and other articles of domestic use. The flax is a hardy plant, and requires no particular care, and is easily propagated by sowing the seeds broadcast in a good soil. The flax is a native of Europe, and is cultivated in various countries, as in Russia, Sweden, Norway, Denmark, Prussia, and other parts of Europe. The flax is a valuable article of commerce, and is extensively used for the manufacture of linen, and other articles of domestic use. The flax is a hardy plant, and requires no particular care, and is easily propagated by sowing the seeds broadcast in a good soil.
the Sp. Gee. Lat. Ger. It. Sp. Sieme, a heat, from (Hflferiiig their piece-goods, being 13 laks of rupees, the highest value of the canvas being Rs. 7,94,978, and that of the piece-goods Rs. 4,96,546.

Flax Seed, linseed.

The seed is in India produced for its oil, and is largely exported.—Stewart; Powell; M‘Callock; Royle. See Linseed.

FLEA.

FLEABANE, PURPLE.

A small dark-coloured and extremely bitter seed, procurable in all Indian bazaars, considered powerfully anesthetic, and also used as an ingredient of a compound powder prescribed in snake-bites by native practitioners. An infusion of seed is also given for coughs, and against flatulence. The Inula pulicaria, or fleabane, a common roadside plant in Britain, strewed or burned in any place, destroys grats and flies, and the same properties are attributed to the common oxeeye daisy of Britain. Flies, fleas, and mosquitoes avoid rooms in which branches of pennyroyal have been suspended. Vernonia cinerea, Lata, is the ash-coloured fleabane.—Ainslie.

FLESH-EATING PLANTS. The insectivorous plants described are the common sun-dew (Drosera rotundifolia), the Venus fly-trap (Dionaea muscipula), an aquatic plant growing in Queens-land, and known as the Aldrovanda vesiculosa, which feeds upon water beetles; the Droso-phyllum Lusitanicum, which the villagers in some parts of Portugal hang up in their cottages as a living fly-catcher; the Pinguicula vulgaris, which flourishes in North Wales, and several varieties of the Utricularia; the Sarracenia purpurea, and the Darlingtonia of N. America.

FLOODS.

FLINDE SRIA AUSTRALIS. This tree is a native of Australia, and its wood is said to be not inferior to mahogany. F. Amboinensis is a native of the islands of Hitu and Ceman. The spiny part of the fruit is formed into rasps. It was on this account called by Humphius, Arbor radulifera.

FLESH.

This mineral is composed almost entirely of silica. It is almost all imported from Britain, being exceedingly rare in India. It is used, when calcined, anew ground, in pottery; also for gun-flints, for which purpose the yellowish-grey flints are preferred. In India the chaledonic quartzes are used instead of flint.—Waterstone.

FLOATING ISLANDS occur in the lake of Kashmir. One occurs in Lake Derwentwater in England.

FLOATS are much used for rafting timber, and they are formed of many vegetable substances. Saccharum sara reeds are much employed, also the bamboo and the fruit of the baobab.

FLOODS.

Of these, the traditions of nations mention several. One Hellenic tradition is known as the flood of Deucalion, son of Pronoucheus, who built the ark, which rested on Parnassus in Thessaly. A similar legend of Asia Minor was connected with the deluge of Iconium, and was localized at Olympus, the highest peak of Western Asia. Missionaries in China have attributed the inundations alluded to as occurring in the reign of Yu, the founder of the first Chinese dynasty, B.C. 2207, to the flood of Noah. The flood of Noah is supposed to have occurred in the year of the world 1565, that is, about B.C. 2328 or 2344. The Aryan Hindu tradition of this great flood are distinct, but involved in their mythical religion. Their Matsya or fish avatar is a version of that event disguised in oriental fiction. One account is given in the Satapatha Brabmana of the Rig Veda; another tradition is in the Mahabharata, where Brahma is the actor; a third in the Bhagavata Purana, and a fourth in the Matsya Purana, both of them indicating Visnun. Disastrous river and sea floods are of very frequent occurrence in India and China. Even the ordinary rain floods are eminently disastrous. A correspondent of the Englishman mentions that, when returning on one occasion from Kishengahr, he found the whole country under water. He got into a fishing dingy, and was rowed straight across country, nothing to be seen out of water but the villages, which looked like islands in a sea; the very parapets of the bridges in the road under water, and but for the trees at the roadside, nothing could indicate that such a thing was. All the crops gone.

Hebrew flood in Samaritan text, D.C. 3044 Brahmanical flood, 3101 Chinese flood, 2052 A.D. At Baghdad, half the city inundated from overflow of the Euphrates.

990. At Baghdad, nearly three-fourths of the city inundated from overflow of the Euphrates.
FLOODS.

908. Persian Gulf, severe eruption following earthquakes, several cities destroyed, and new islands formed.

1763. Baghdad overflowed by inundation of the river.

1868. Tigris again overflowed, and did much damage.

1876. Baghdad again inundated, after appearance of red flame.

1291 and 1304. Damascus inundated by overflow of river Jordan.

1842. The city of Kaffa besieged by rebels, and embankments destroyed and city inundated, during which 300,000 persons perished.

1763. Burhanpur overflowed by the river Tapti from heavy rains, a quarter of the city inundated, and one-tenth of the houses destroyed.

1765. Heavy floods in Behar and Bengal, and in 1769 and 1770 rain scanty.

1770. Great flood in Eastern Bengal.

1832. Great destruction in Calcutta from rain and floods.

1784. Some of the N.W. Provinces suffered greatly from floods after a great drought.

1787-88. Floods in Behar and N.W. Provinces, said to have Balesar 17,474 people and 100,000 head of cattle. Rain of 1787 began early, and continued late, particularly in Bengal, Jessore, Nuddan, and Behar. About 1st October a tremendous storm of rain and wind swept over W. of the N.W. Provinces, followed by floods which ran across almost all Bengal, and the crops largely destroyed. In Rangpur, in 1787-88, the excessive rains in the Himalayas, followed by wet weather in the district, caused the Tista to rise and its riverine rapids to sweep over the district; whole villages entirely disappeared, and multitudes of people and cattle perished; and on the 24th December, just as the rice was getting into ear, a cyclone with torrents of rain and destructive violence席卷ed the district, and the whole of Rangpur was lost, and in the Panga pargana half the population was gone. In the same year, 60,000 of the inhabitants fell victims to famine following on floods.

1800. Great floods.

1815. August. Floods occurred on the coast of Canara and Malabar.

1831-32. A flood occurred in the delta of the Ganges on October 8, 1831, when 90,000 lives were lost; nearly 80,000 people drowned; in 1832, 2000 in the same neighbourhood.—As. Jl. 1833.

1832. At Coringa a great and very destructive inundation.—Beng. As. Soc. Journal, 1834, xiv. p. 239.

1833. November. At Canton, excessive rain, and 15,000 houses were swept away, and 15,000,000 people inundated.

1837. On the Tapti at Surat, on August 6, 1837, 5000 houses were said to have been destroyed, the loss estimated at between 30 and 40 lakhs of rupees ($300,000 to $400,000) and a lakh and a half was estimated at Bombay to supply the sufferers with grain.

1838-39? The Ganges once rose 45 feet above the usual level; swept away Burree Bund, and laid a town four feet under water, and, according to an account, it appeared in the Agra Ukhbar August 30, 1839.—As. Jl. 1839. Inundations at Hussingabad were mentioned in As. Jl., April 1839, and a description of that at Agra in the As. Jl. 1839.

1839. December. Great floods, caused by a cyclone, swept 9 feet above the level of Coringa village; the inundation covered 30 miles of country, and above 7000 people were drowned. £100,000 worth of property destroyed; at sea 7000 lives.

1841. The Indus seemed to have been for some time ponded back, when a terrific flood swept over Attock and all the country around. Dr. Falconer gave an account of it in H. As. Trans. 1843, x. and Journ. xii. p. 362. It occurred from the giving way of a glacier. The body of a woman dressed in sheep-skins was thrown ashore at Attock, and supposed to be a Tibetan; 10,000 lives were saved. (As. Jl. 1841, xxxiv. p. 194.) Captain Abbott gave an account of it from lips of natives in the H. As. Trans. 1841, x. p. 220. From hundreds of villages and towns, including Khryabid and Attock, thousands of human beings and cattle were swept away. In the Hazara country, artillery guns with many hundreds of infantry and cavalry were lost; a whole camp with troops and Aghan bazaar is said to have been swept away.

1845. Great floods in China, destroying the shores of the Yellow Sea, submerging whole provinces.

1849. Dr. Buist gave an account of that of 1849 in Edin. Phil. Jl. 1851; Bl. As. Trans. 1851.

1856. Provinces nearly destroyed by overflow of the Irawadi.

1866. In Puri, during the 32 years ending in 1866, there were 24 years of excessive rains, but in 1866 floods swept over nearly all the Puri districts; in one particular, 5000 persons were drowned, 12 lakhs of solid land were suddenly turned into a sea from 7 to 9 feet deep, and thousands of families floated about in canoes on bamboo rafts, and on trees, and many perished. In 1789-90, 1777, 1788, 1866, 1874, and 1877, there were great floods in the province, and in the famine of 1866 was felt in the Twenty-four Parganas, in Nadiya, Hugli, Dacca, and Murshidabad; and Orissa was devastated. The numbers who perished will never be accurately known. The estimate has been about one-fourth of the entire population. In 1867. A great sea-wave in a cyclone broke along the coast at Malaputapatam, and caused enormous loss of life and property.

1871. Northern great floods.

1872. In Kandesh and Nasik, great floods, attributed to the destruction of the forests.

1875. In Bengal, heavier floods than in 1871.

1875. In N.W. Provinces, disastrous floods, causing loss of life and destruction of property.

1875-76. The river Tons and the Jumna rose, and the waters of the Jumna entered Allahabad. On the subsidence of the floods, it was found that 772 villages had been destroyed or damaged, 185 lives lost, 1949 head of cattle and 926 sheep and swine drowned, and the total damage estimated at nearly 14 lakhs of rupees.

1876. In northern provinces of China great floods.

1876. In October 1876, a tidal wave, consequent on a hurricane which swept Bheel Bungo, in the district of 200,000, and great destruction of property.

1878. For four months up to March, in Ceylon, a succession of floods.

—Edge in Load. As. Trans. 1836, ii. p. 342; Dr. Buist's Catalogue.

FLORA.

FLORA of the South and East of Asia has been largely described by some of the most eminent of the botanists of the world, whose names will be seen under the article Botany. But the most complete recent view given of the plants of this South-Eastern region is by Drs. (Sir) J. D. Hooker and T. Thomson in their Flora Indica. There is a striking resemblance between the vegetation of tropical Africa and tropical Asia; but India contains representatives of every natural family on the globe, a very few small American, Australian, and S. African orders being the chief exceptions. Many North African or Arabian forms, such as Peganum, Harmac, Fagonia cretica, Balanites ,Egyptiaca, Acacia Arabica, Alhagi, Grangea, Calotropis, and Salvadoria Persica extend through the drier parts of India; and others, Cleome, Balsamodendron, Astragalus hamatus, Cucumis colocynthis, Bertholletia, Anticharis Arabica, etc., have a less extensive range. In the humid parts of tropical India, as in the impenetrable green jungles of the equable and rainy Malay Peninsular, of Eastern Bengal, the west coast of the Madras Presidency, and of Ceylon, the flora contrasts strongly with that of the drier parts of the intertropical zone, and still more so with the loosely timbered districts of Central India and of the base of the Western Himalaya. Many genera and families, as most palms, Cycas, Diplopteronaceae, except Vatica, Aurantiacae, Conna-
raccaceae, Meliaceae, Myrtaceae, Rubiaceae, Ebenaceae, and many more, which are sensitive to cold, are comparatively local when found beyond the tropics. Many Leguminosae (viz. Bauhinia, Acacia, Erythrina, Butea, Dalbergia, and Milletia), Bombax, Vatica, Nauclea, Combretaceae, Verbenaceae, Lagerstroemia, Grislea, Jasminaceae, and Bignonia Indica, are indifferent to the cold of winter provided they experience a great summer heat; and they advance far beyond the tropics, and lend a more or less tropical aspect to the flora even of the base of the North-Western Himalaya, in lat. 35° N. On the other hand, the perennially humid forests are uniformly characterized by the prevalence of ferns; and at elevations below 5000 to 7000 feet, by the immense numbers of epiphytal Orchideae, Orontiaceae, and Seitanicaceae. They contain a far greater amount of species than the drier forests, and are further characterized by Zingiberaceae, Xyridaceae, palms, Pandanaceae, Dracaena, Piper, Chloranthus, Urticaceae, especially Arctocarpus, and Ficic, Araliaeae, Apoecynaceae, shrubby Rubiaceae, Aurantaceae, Geroncinaee, Anonaceae, nutmeg, and Diptercarpaceae. The bulk of the flora of the perennially humid regions of India, as of the whole Malay Peninsula, the Upper Assam valley, the Khasya mountains, the forests at the base of the Himalaya from the Brahmaputra to the Nalahar coast and of Ceylon, are of one type, which includes a very large proportion of the Indian genera.

In India the number of peculiar families largely represented in it is very limited; the Aurantiaeeae, Dipteraceaeae, Balsaminaceae, Ebenaceae, Jasminaceae, and Cyrtandraeaceae are the only orders which are largely developed in India, and sparingly elsewhere, and of these few contain one hundred Indian species. The total number of Indian species are estimated at 12,000 to 15,000. The species are much scattered. It is believed that nowhere in India could more than 2000 flowering plants be found in a radius of ten miles; and there is in India an almost complete absence of absolutely local plants. The plains of India are everywhere poor in species; and such as abound in individuals are usually of a woody character. Indeed, there are few of the families in which the vegetation of the more accessible parts presents so little beauty or such short seasons of bloom. The great number of 222 British plants extend into India. Many North African and Arabian forms occur. Several Australian species are found in the Malay Peninsula. Many of the Himalaya, Neillgherries, Khasya, and Ceylon species are found in the Malay Peninsula and in Java. Gaultheria umbrularia extends from the N.W. Himalaya to the Java mountains; and common to India and Java are Sedwickia cerasifolia, Griff., Marlea, Cardiopheris lobata, several oaks and chestnuts, Antideminee, a willow, and Myrica. The Chinese type is abundant in the temperate region of the Himalaya, and plants of N. America west of the Rocky Mountains also occur. An immense proportion of annual plants, which vegetate during the last rainy seasons in the plains and ascend the lofty mountains, are uniformly distributed throughout India. Of these the most conspicuous are Gramineae, Cypereaceae, a vast number of small Leguminosae and Scrophularineae, Composite, some Labiateae, Amaranthaceae, Convolvulaceae, and Acanthaceae.

**FLORA.**

**Belta of Vegetation.**—The flora of the Himalaya mountains, including that of the most northern parts of China, shows an almost complete identity with the genera found covering the elevated belt of the Himalaya. If we commence with the bases of these mountains, and pass successively through the several belts, and (analogous to what takes place between the parallels of latitude of 40° to 45°) experience the rapid decrease of temperature and the quick succession of vegetable productions, we first find a vegetation similar to that of the southern provinces of India. The agricultural products consist of rice, millet, amaranth, an esculent arum, ginger, turmeric, a little cotton, and sugar at the season, succeeded by wheat, barley, and buckwheat in the cold-winter months. Along with plantains, oleander, and some of the orange tribe, we meet also with some species which were long considered peculiar to China, as Marlea begonifolia and Houttuynia cordata, with species of Chloranthus, Incarvillia, and Hiptage. On ascending, we pass through different gradations of vegetation, until, reaching the regions of the oak and rhododendrons, which is immediately succeeded by that of pines, we meet another mild region, with a flora which must approximate to that of the mountains of the central provinces of China. For here we find the Chinese genera Abelia and Eurya, with Stantonia, Kadura, Hovenia, etc., and it is in the midst of similar vegetation that the tea-plant is everywhere found. Dr. Royle notices the similarity of products of the Chinese tea districts and the Himalaya. He says, as the camphor, varnish, wood-oil, and tallow trees constitute a part of the natural riches of China, so we have in the Himalayas and at their foot, Camphora glandulifera, containing solid grains of camphor in its wood. Melanorrheaa usitata, Woll., yields abundance of excellent varnish; besides Rhus vernicifera, the varnish tree of Japan, which is common in the Himalaya. Wood-oil is yielded by several species of Diptercarpus; oil is obtained from apricot seeds, and from Prinsepia utilis in China, as it is in the Himalaya; and paper of the Daphne Cannabina is also a product common to both, as also the butter of Bassia butyracea, which is found at Almaten and in Turkestan.

The winter months of the colder northern countries have a corresponding cold season in India, during which ex-tropical cereals, wheat, barley, and more rarely oats, with various kinds of pulse, are cultivated; and many wild plants appear, very many Cypereaceae, grasses, and such aquatics as Myriophyllum, Potamogeton, Vallisneria, Zannichellia, Lemna, and others. The mountainous regions of Afghanistan are rich in Himalayan forms, and contain an immense number of European and Persian plants, which find their eastern limits within the British Himalaya; and many plants are found in those mountainous regions common to Europe and the Himalaya. Nepal, Bhutan, East Tibet, and the Khasya mountains present a flora which has much in common, and in a geographically-botanical point of view is one of the most important regions in India. If not in all Asia. In the Himalaya, the genera Rhododendron, Monotropra, Pedicularia, Corydalis, Nepeta, Carex, Spirea, Primula, Cerasus, Lonicera, Viburnum, and Saxusrica attain their maximum of development. The majority of the Afghan and Tibetan plants are also on the one hand natives respectively of
the Caspian steppe and N. Persia, and of Siberia on the other.

On the Himalaya and on the isolated mountain ranges of the Peninsula of India, on the heights of Ceylon, and on the volcanic cones of Java, many plants occur, either identically the same or representing each other, and at the same time representing plants of Europe not found in the intervening hot lowlands. A list of the genera collected on the loftier peaks of Java raises a picture of a collection made on a hill in Europe. Still more striking is the fact that Southern Australian forms are clearly represented by plants growing on the summits of the mountains of Borneo. Some of these Australian forms extend along the heights of the Peninsula of Malacea, and are thinly scattered on the one hand over India, and on the other as far north as Japan. Along the Himalaya, at points 900 miles apart, glaciers have left the marks of their former low descent; and in Sikkim Dr. Hooker saw maize growing in gigantic ancient morasses. Plants on the Himalaya and Neighberrics, Ceylon, and the Khasaya mountains, and in the Malay Peninsula, and the moist and more equal parts of India, are identical with those of Java. The genus Calamus, Orchids, Areceaee, Zingiberaceae, and ferns are especially abundant; the genus Grammatophyllum, the wonderful Nepenthaceae, or pitcher plants, of which solitary species occur in Madagascar, Ceylon, the Seychelles, Celebes, and the Moluccas.—Powell; Darwin, Origin of Species, 3d ed. p. 403; Wallace, i. p. 138; Hook. and Thomson, Pl. Ind.

FLORA COCHIN-CHINENSIS, a botanical work by Fr. Loureiro.

FLORES, called also Ednie or Mangerey, an extensive island of the Archipelago, 201 miles long from E. to W., and from 42 to 45 miles broad. Flores Head is in about lat. 8° 44′ S. and long. 122° 50′ E. It is so named from the Portuguese word Flor, a flower. Flores Island is the fifth in a line E. from Java due S. of Celebes, and of volcanic formation, and affords the first example of a race of men seemingly intermediate between the Malay and Papuan, but partaking far more of the physical form of the former than of the latter. The complexion is a good dark yellower than that of the Malay, the nose flatter, the mouth wider, and the lips thicker. The hair is not lank as in the Malay, but buckles, without frizzling as in the Papuan. The stature is the same as that of the Malay, that is, short and squab. Bugis settlers in the island told Mr. Crawford that Flores is inhabited by six different nations, speaking as many different languages. The Ende, the Mangari, the Kio, the Roka, the Konga, and the Galeteg,—names all derived from the principal places of their residence. The coast is occupied by the Malay or brown race; but in the interior is a people with frizzled hair, and a similar frizzled hair people live in the mountainous parts of Solor, Pintar, Lombata, and Ombay. Captain Keppel gives the following translation from a Dutch journal:—On the island of Flores there lives a race, called on the south coast Rakka, who not only devour their enemies, but with whom custom requires that the son shall cut the body of his deceased father in pieces, and sell the flesh to the inhabitants at the high price of its weight in gold. This flesh is greedily eaten by the people as a great delicacy. If the father was heavy and of great size, the son considers himself particularly fortunate. The population of Endore, on the same island, is also very greedy of human flesh. But these cannibals confine themselves to the heart, which with incredible dexterity they extract from the body, by giving a blow under the left shoulder-blade. It is then cut into very small pieces, eaten completely raw by the bystanders who belong to the same race. Capt. Keppel adds, 'I am not able to corroborate this.' Galeteg is a locality in the island of Flores, occupied by a race so called.—Horsburgh; Bikmore; Keppel's Ind. Arch. ii. 149; Crawford.

FLORICANS are birds of the tribe Prioreostres, family Otididæ, bustards and floricans, which occur in many parts of India, and to the N.W. of Afghanistan. They are, like the bustard, speckled, greyish-coloured birds; the males have plumes, and change their plumage in the breeding season. The little bustard of Europe is said once to have been called the Flanderkin, which may be the source of the name. The species are now arranged under the genus Sypherodites.

S. Bengalensis, Gmel., Bengal Florikan.
Otis delicosa, Gray. O. Himalayana, Vog.
Charass, Charaj, or Dabar of . . . Nepal.
Charas, . . . Hind.

In the breeding season, the whole head of the male, which is very fully crested, the neck, breast, and lower parts and thigh coverts, are of deep glossy black, the plumes of the breast elongated, forming a full breast tuft, and the feathers of the neck in front also lengthened; back a rich olive buff, with zigzag markings, and a black dash in the centre of each feather. It is 24 to 27 inches long. It is found throughout Lower Bengal, north of the Ganges, north-easterly to the foot of the Himalaya, into Dacca, Assam, Tiparrah, Sylhet; north-westerly into the valley of the Jumna, Rajputana, the Cis-Sutlej States, and parts of the Panjab. It frequents large tracts of moderately high grass. The sexes live apart, but near each other.

S. auritus, Lath., Lessor Florikan, Otis fulva, Syke.

Chulla eheh, etc.

The Bilis name means grass partridge; and it gets its Tamil name from being usually found in fields of warragu (Paspalum frumentaceum). The lesser florikan, also called the common florikan and black florikan, is 19 to 21 inches long. In winter dress the male closely resembles the female, but has always some white on the shoulder of the wing; when in full breeding plumage, the male in its head, neck, ear-tufts, medial wing coverts, and all its lower plumage is deep black, the chin alone being white, the rest of the plumage fulvous. The different character of the plumage in the two seasons has led some to write on this bird under two names. It is found throughout India, from the extreme south to the foot of the Himalaya, and frequents long grass in preference to any other shelter.—Jerd. Birds of India, ii.

FLOUR OF WHEAT.

Fleur de farine, . . . Fr. . . . Flour de farine. . . . Port.
Sammel-mehl, . . . Godhuma phaha.
Tringa-pittaya, . . . Singh.
Lumat.
FLOWER BATTEN.

Meal of wheat flour. When sifted, maize is the finer part of wheat flour, and soogie the coarser. In India, the unsifted wheat flour, the atta, does not readily leave into wheaten bread, for which the sifted soogie, the semolina of Italy, is solely used. The natives who use wheat use the atta or unsifted flour, and the maize where obtainable. The farina of wheat is used as food in British India. Rice-flour is somewhat in use; in the Archipelago that from the sago tree is very extensively consumed. There were samples of seven varieties of flour made from roots in Paasuruan, and called kering, kalata, jawi, sajo, arrowroot, katela, bat, and flâwek, in the cookery; either used medicinally or as delicacies for invalids. See Bread; Farina; Food; Semolina; Soogie.

FLOWER BATTEN, a very hard, fine, close-grained, heavy Ceylon wood. Its surface shows a pleasing mottled pattern.

FLOWER DEW-WATER of the Chinese is the dew gathered at early morning from certain allaceous plants, and especially from that of the sweet flag. The Mahomedan herbalists of India gather it from the stalks of the rice plant.

FLOWERS.

Flowers are largely used by Mahomedans, Hindustan Buddhists, and the followers of Confucius in their worship of the deity, or of their idols, and in their offerings for the dead. Flowers do not seem to have been similarly employed at any time by the Hebrew race; and in Acts xiv. 13, when the priests of Jupiter came to Paul with an ox for sacrifice and with garlands, is the only mention of them that occurs. At the time of worship, the Hindu priest places a garland of flowers upon the idol. Whether Paul and Silas were to be the objects of worship, to receive the garlands, or the ox intended to be slaughtered, in either case the practice would be commensurate to that of the Hindus. There are numerous flower shops for their sale. But though so largely used in the south and east of Asia, the Aryan Hindu does not seem to care for flowers as beautiful objects of nature. He could not sing,—

"In summer, autumn, winter, or spring,
A flower to me is the loveliest thing.
That hath its birth
On this chequered earth,"

though Western poets delight to dwell on the love that Eastern races have for the natural flowers. Hindu ladies sometimes wear a little mirror, called chury, of polished metal, in a ring on the thumb, and amulet Hindu the lotus is the emblem of female beauty. In a tale, it is mentioned that Krishna, who had concealed his passion from the parents of a damsel whom he secretly visited, unfortunately chanced to find her in the midst of her relations. How great her distress! He was averse to departing without expressing his passion; words were debased, both were embarrassed, love prompted:

"He with five flowerets tips the ruthless darts, Which through five senses pierce enraptured hearts; Strong Champa, rich in odorous gold; Where Amer, nurtured in her salt mould; Dry Nag-keser, in silver smiling; Hot Kittikam, our sense beguiling; And last, to kindle fierce the scorching flame, Love-shake which gods bright Vela name."

Clitoria ternatea is sacred to Durga; Joneasia asoca is a sacred plant. The cax plant is sacred to Siva. Baka, a kidney-shaped flower, is sacred to Vishnu. The flowers of Minimus elengi are favourites for garlands. The Chrysanthemum Indicum has a favourite garland flower. Datura fastosu is sacred to Siva. Christians in India largely use the flowers of the Tagetes erectum on Christmas day. Hibiscus rosa-Sinensis is sacred to Kali; Jasminium pubescens is sacred to Vishnu; Nerium odorum to Siva; Nelimium spectiosum, the Indian lotus, is sacred to Brahma, Vishnu, Siva, and their consorts, Saraswati, Lakshmi, and Parvati; Nytanthes arbor-tristis is sacred to Siva. The Buddhists make great offerings of flowers at their temples, but these are not used by the Buddhist priest for decking the person. The Mahomedans use them largely for laying over the tombs of their departed. The beautiful purple and fragrant Bignonia champaca is a pagoda plant, its fragrant and sweet-smelling Millingtonia or bela tree, the cork tree; and the Justicia pieta is a shrub admired for its beautiful, varieegated green and white leaves.

'Jesu!' blessed be the God for flowers!—For the bright, gentle, holy thoughts that breathe Out from their odorous beauty, like a wreath Of sunshine on life's hours.'

—Jafrey; Ains. Ward's Hindoos; Hardy, Eastern Monachism; D. L. Richardson.

FLUGGEA, a genus of plants of the natural order Euphorbiaceae. F. leucopus is a small tree of many parts of India; F. retusa grows on the banks of the Jumna; and F. virosa grows on the Jumna and westward to the Siwalk Hills and Bhotiya, and in the latter is cultivated as a horticultural plant of China and Japan; its mucilaginous tubers can be used for food.—F. v. Mueller.

FLUGGEA VIROSA. R. Phyllanthus vir., R. Girk, . . . HIND. Vanuhati, . . . SUTLEJ. Bats of. . . SUTLEJ. Peri pastwane, Th. Ind.

Occurs on the Jumna, on the Siwalk, Salt Range, and Trans-Indus. The wood is close-grained and strong. Its fruit is edible by man and beast; its bark is astringent, and is used to intoxicate fish. —Roxb.; Stewart; Voigt; O'Sh.

FLOR SPAR, Derbyshire Spar, Native Fluoride of Calcium, Taie- shih-yang, CHIN., occurs in the Canton and Che-kiang provinces of China. Its powder is given in sterility and lung diseases. Found in great beauty and abundance in Derbyshire and other places.—Smith; Mason; Waterstone; Faulkner.

FLY. In the Hebrew Scriptures are several Hebrew words which in the English version have been translated fly, viz. Orub, Zebub, Deurrabah, Ta'ira, Sarabin, Bak, Cimim. The Orub or Orab, a swarm or assemblage, is translated in Psalm cxv. 31 swarm of flies, but in Exonus viii. 21, also Psalm lxviii. 45, is employed to allude to the mosquito. The Hebrew Zezon of Ecclesiastes x. 1 and Isaiah vii. 18 is not identified. Flies are undoubtedly very troublesome in tropical Asia at some seasons, but an infusion of quassia
sweetened with sugar placed on a plate destroys them. The eye-fly, a minute insect which comes at seasons inside houses, and clusters in myriads on any hanging thread, can be destroyed instantaneously in masses, by forming a cone of paper like that for a grocery packet, and, setting fire to its edges, bringing it under the thread where they cluster; their wings are singed as they try to escape out of the burning circle. In Italy, large bundles of a common viscos plant (Erigeron viscosum, *Linn.*) dipped in milk, hung up in the rooms, attract all the flies. Glossinia morisians, the Tsetsy fly of Africa, whose bite is fatal to the horse, the bullock, and cow, is supposed to be the same as the Tsalt sia or Zimb of Abyssinia, mentioned by Bruce. See Ban; Fleabane.

FLY-CATCHERS, birds of the family Muscie- pidae and sub-families Muscieopina and Myiogrinae, comprising the genera teitra, myzura, leucocera, chelidophryx, cryptolopa, hemichelydon, alsonax, ochronula, cunyias, cyornis, musciepula, nitidula, niltava, antipes, sipisia, and erythroperna, birds with large gaps, which subsist on flies and small insects. Many of them have bright-coloured plumage. Tetrica paradisi, the Hussini bulbul, has its tail feathers greatly elongated, and is a beautiful object when in flight. The red-breasted, species of cyornis, occur through all the East Indies; and the beautiful sapphire-headed fly-catcher, Musciepula sapphira, is found in Nepal and Sikkim.

FLYING CATS, a name given to the flying mammals of the genus Galeopithecus, of the family Galeopithecideae, and natives of Malayana. They are usually called flying lemurs. They have a membrane connecting their limbs, but they have not the power of sustaining flight. They have pectoral mamms, and sleep with their head downward. They are insectivorous and insec<torious.—*

FLYING FISH. Jerad ul bahar, Arab. The flying fish are species of the genus Exocetus, belonging to the abdominal Malacopterygii, forming part of the family Exociiidae. Their pectoral fins are very long, nearly equal to the length of the body. The fish, to escape its enemies, rises into the air, and the pectoral fins vibrate while wet, and re-vibrate as often as they pass through a crest wave, wetting the fins afresh. There are many species,—Exocetus volitans, *Linn.*; E. solitarius, E. evolans, E. oxilens, E. mesogaster, and others. The E. volitans is usually 10 or 12 inches long, but E. solitarius attains to 15 or 20 inches at greatest. They are captured by torch-light in the West Indies. At the island of St. Helena they are from 15 to 20 inches long; are used there, as in the West Indies, for food, being very sweet and of delicate flavour. E. solitarius is so named from not being seen in large schools like the *E. volitans*, and it appears to have other specific difference. When watching these fishes closely, as they passed under the stern of the ship, Dr. Bennett remarked that the extension of both the pectoral and ventral fins was effected with an audible rustling noise, and only a vibratory motion was perceptible afterwards; nor was there any expansion and contraction of those organs during flight, after the first effort. Had there been any percussion of the pectoral fins, it would have been distinctly visible, owing to the proximity of the fish; indeed, to produce percussion of the fins, it would be requisite to have an elaborate muscular apparatus; and as, on dissection, such is not found, the theory of that action of the fins may be considered unsupported by facts. The fish, when keeping in a direct line of flight, proceed for a great distance; but when this is deviated from, and it turns round (which action was apparently performed by the tail, not by the pectoral fins), it only proceeds about the length of a yard, and drops into the water. The greatest length of time he had seen them fly has been 32 seconds, and their longest flight from 200 to 250 yards. The flying fish has a steady flight, resembling that of a flock of swallows; but when pursued by enemies, or frightened by the passage of a ship through the water, it loses this graceful style of volition, its flight becomes hurried, irregular, stiff, and awkward,—a kind of scrambling pace,—and it frequently drops into the water, and again renewed its flight in the same unsteady manner. When a large shoal of them emerged at the same time from the sea, it was perceived that some of them dropped immediately, others passed over a distance of 20 yards and fell, while the rest continued a steady flight of 170 to 200 yards, and passed out of sight. Their long pectoral fins or wings have the rays united by a fine delicate membrane, flexible and transparent; the colour of this membrane varies; and some have the ventral fins so large as to appear to have four wings.—Collingwood; Gatherings of a Naturalist in Australia, by G. Bennett, M.D., p. 15; Captain B. Hall's Fragments.

FLYING FOX.

FLYING FOX is the name by which Europeans in India designate the fruit-eating bats of the family Pteropodidae, of the S.E. of Asia, Malayalnian islands, as far as Australia. The females of some have nursing pouches. The species are Pteropus Edwardsi, Pt. Leschenaultii, Pt. edulis of Java, and others; also Cynopterus marginatus, C. alflinis, Pt. minimus from Tenasserim. The flying fox of Australia is Pt. poliocephalus. They roost during the day on trees, generally in large colonies, to the number of many hundreds, often, occupying a single tree. Towards sunset they fly off, sometimes to great distances, to trees that are in fruit, for the garden fruits, and those of the mim, ber, and fig trees, returning at early dawn from their hunting grounds to their roosting tree, where they wrangle to get the best places, striking with their wing claw, screaming and cackling, and circling round the tree till they can hook on. They hang with their heads down.—Ken.

FLYING GURNARD. Of these fishes two species occur, one the Dactylopterus orientalis of the Indian Ocean, the other D. volitans of the Mediterranean, Atlantic, and West Indian seas. A singularly beautiful species raises itself into the air by means of its large pectoral fins, which they are said to move in their flight. See Dactylopterus; Trigla.

FLYING HORSE, species of Pegasus.

FLYING SQUID, Loligo sagittatus.

FO, the Chinese name for a Buddha. for Sakya Muni, and proceeding Buddhas. One fo is said to have gone from India to China, B.C. 1200. See Adam's Peak; Buddha; Kwang-yin.
FODDER for cattle in India is of various plants,—the root of the harial grass, Cynodon dactylon; the stalk of the joar, Sorghum vulgare, cut into small pieces; the straw of several grasses, Paspalum scrobiculatum, Pennisetum s htmlspecialchars Sundari, Panicum Italicum, P. frumentaceum, P. miliare, and Eleusine Ægyptiaca. Buffaloes are also fond of kans (Saccharum [impertata] spontaneum) and its varieties. The pasture grasses in Hurriana are celebrated for the herbs of cattle which graze on them, species of Panicum, Pennisetum, Cenchrus, Chetetera, Valsa, Daetlyolium, Chloris, Eleusine, Achrchne, Fos, Ergrostis, Andropogon, species of Phragmites and Rottbilia. A clover or lucerne, shotal, is grown; also siniji, but this principally by Europeans for their horses and other cattle. Cattle are usually fed (besides grass) on bhusa, or, as it is called in Panjubi, turi, the chopped straws of wheat and barley; besides which they get karni, the dried stalks of joar (Sorghum vulgare); this latter when green and fresh is called charri. Chopped leaves of the ber (both Ziaxylus vulgaris and Z. nummlaria), called malla, are much used, and are said to be fattening. In Shahpur and one or two other districts, turnips are grown very extensively for feeding cattle during the cold weather, and they often attain a larger size than in Europe. The manikan grass, the wild sawkun, phog, the seed of Caligo-num polygonum, is used, and also as human food in the Panjubi in times of famine. Dhaman or anjan (Pennisetum combrichodes) is considered the best grass for cattle, rapidly improving their condition and increasing their produce in milk. Jhang is a scented grass, probably Andropogon schenchatnus; and the root of A. muricatum forms the khaz khas used in matting tatties and screens for cooling the atmosphere. The leaves and fruit of many trees are used; and Dr. J. L. Stewart names 64 trees which furnish fodder in the Panjubi.

As fodder for camels, there are Khazya stricta, D. C.; Salsola species—Calotropis Hamiltonii, W.; Euphorbia nereolus, L.; Sueda species—Tri-anthema micrantha, Xxygyphillum simplex, etc. The camel eats the Nerium odorum, but it invariably proves fatal.

The farmers of India have ever long trusted to the natural grasses, and this has led to the impression that India is very deficient in green crops suitable for the food of cattle, and that, from June to October especially, there is nothing to be got but roots; and the great difficulty has been to find some crop that will yield green fodder during the months of June, July, and August.

In the vicinity of Madras, at the experimental farm at Syadapat, Mr. Robertson in 1870 reported that with care an abundance of green fodder may be maintained all the year round; that an acre of land thus laid out will amply keep two or three horses, and double that number of cattle; that, with abundance of water, harial grass is the most profitable crop; with a tolerable supply, Sorghum saccharatum pays best; with water only from October to May, yellow chulum and cumbo will maintain an abundant and continuous supply of green and nutritious food. He says the cumbo crop afforded an abundant supply of green fodder at a time when it was usually very scarce. Under irrigation it is possible to grow yellow chulum so as to afford a supply of green fodder throughout the hot season; but there are large tracts of country to which irrigation cannot be applied, in which cumbo will yield excellent green fodder during the season when the stock-feeder finds it the most difficult to maintain the condition of his animals. Cumbo sown in the middle of June received no water other than the ordinary rainfall. Within six weeks it reached an average height of not less than eight feet, and was then cut for green fodder. The cattle eat it greedily, and fattened much more rapidly than usual on other green crops. The weight of the fodder reached the high figure of 1800 pounds per acre. It would be the easiest thing in the world to arrange the planting of the cumbo as to obtain a constant supply of fodder at all times. On one occasion, when several advantageous circumstances met, the harial grass at this place grew to the enormous height of eight feet. At the People's Park, Madras, three crops of excellent grass are cut each year, on areas that are not irrigated. Yellow chulum is cultivated almost everywhere as a grain crop; but at the Government farm it was cut several times for fodder, and then allowed to go on to grain. The plant grows so rapidly, that in sixty days after planting the stems will be seven feet high and about an inch and a half thick. This stem is perfectly succulent, and is eaten with avidity by cattle and sheep. Horse grass grows almost anywhere, requires a minimum of care, and gives a good dry fodder or hay. Without other help than the ordinary rain, it will give 7000 pounds of green fodder per acre—a fodder which is very fattening, and well liked by cattle and sheep. If abundance of water be available there is nothing like harial grass. At the Kistnaupett sewage farm, an acre of land produces not far short of 100,000 pounds of green fodder in the twelve months.—Powell; Royle, Him. Bot. p. 491; Mason; Williams' Middle Kingdom; Hooker's Him. Jour. ii. p. 289; Mr. Robertson's Report.

FEICINICULUM DULCE, Hwai-hiang and Siau-hwin-hiang of the Chinese. In China, the stalks and leaves are eaten as a condiment.—Smith.

FEICINICULUM PANMORI. D. C.

Anethum Panmori, Roxb.

Razeenaj, ... Arab. Badian, ... Pers.
Mooree, ... Beng. Moodori, ... Sansk.
Goowa mooree, ... M. D. Deowadooroo, ... Singh.
Sonf, Mayuri, ... Hind. Perun siragam, ... Tam.
Panmohori, ... Pedda gillaka, ... Tel.

Cultivated in India. Flower small, bright-yellow, February; fruit, March and April. Seeds of a pleasant, sweet, warmish taste, used for culinary and medicinal purposes, especially among the natives.—Roxb. ; Voigt; Beng. Disp. p. 208.

FEICINICULUM VULGARE, fennel, Anethum feniculum, L.

Sonf, ... Hind. Bchik-ka-rash, ... Pers.
Adas, ... Jav. Shohi kire, ... Tam.
Bchik-badian, ... Pers.

Cultivated in the plains of the Panjubi as a pot herb. An essential oil is prepared in large quantities from the seeds. The odour of the entire plant is strong and persistent; that of the roots disappears on drying.—Stewart; Fo-Hi, the Great, Brilliant (Tai Hao), in China, is a king who cultivated astronomy and religion. Fo-hi is the first named sovereign of the Chinese, but the date of his reign is not ascertained. Yu, the Great, is the first monarch.
FOH-KIEN.

of whose reality there is no doubt, and his accession occurred about 2000 years before the Christian era. Husbandry and silk-weaving were the earliest of the arts cultivated by this people: the former was introduced by Shin-nong, the immediate successor of Fo-hi, and silk-weaving by an emperor; and to both of these the Chinese perform sacrifices on their annual festival days. Husbandry is still highly honoured, and annually, at a grand festival in honour of the spring, the emperor ploughs and sows a field. The Egyptians, Persians, and Greeks held games and festivals, mingled with religious ceremonies, at seed-sowing, as Hindus now do; and in England formerly the festival of Plough Monday was held, during which the plough light was set up before the image of the patron saint of the village.—Eliott.

FOH-KIEN, a Chinese district, lies on the coast, and is bounded on the N.E. by Cho-kiang, on the N.W. by Kiang-si, and on the S.W. by Kwang-tung. Its surface is estimated about 57,000 square miles, and its population is about fifteen millions. Foh-kien is the principal black tea district of China. The remnant hills of Bohoe, are distant 152 miles from Fu-chu-fu, the capital of Foh-kien.—Sirs China and Chinese.

FOIL. In the arts, metals are rolled and beaten out into thin leaves; and large quantities of gold, silver, tin, and brass foils are so used in India, Burma, and China for ornamental work in their temples and in ornaments. In jewellery, foils are manufactured by painting a sheet of silver foil with the required colour mixed in a transparent varnish, and placed beneath a precious stone.—King.

FO-FO-KWE-KI, a Buddhist work. See Sakya.
FOLIA MALABATHRI, F. tamalapathri, and F. Indica of Dioscorides and Pliny, supposed to be Cinnamomum tamala or C. nitidum, Nees; also thought by some to be the leaves of piper betel.

FO-LING, a root so called by the Chinese, comes from the rhubarb region, and formerly well known in the European Pharmacopoeia, under the name Radix China.—Yule, Cathay, i. cvii.

FOLK-SONG S. The influence of Brahmanic literature does not seem to be much felt among those who have transmitted the folk-songs from generation to generation. Though many of them refer to the subject of death, there is scarcely a word about transmigration. When the ordinary Hindu is about to die, ‘he looks away from ceremonial and obscure tradition unto the great God; for throughout these songs there is but one God to the mind and heart of the worshipper.’ The Dasari are professional minstrels, who beg and sing in streets and villages and at the gates of pagodas, and, being all worshippers of Vishnu, invoke their one God by that name. Some of the folk-songs ridicule the distinction of caste and the pretensions of the Brahmans, and broadly state that with God there is no distinction of persons, except after the eternal laws of right and wrong. Others, life is looked upon as a mere illusion or maya. It is a time of probation; but it is so much easier to do wrong than to follow right, that in reality men may be carried farther and farther away from God. Throughout many of these there breathes an overwhelming sense of sorrow and failure that calls forth our deepest compassion. Some of the folk-songs of Southern India might be sung by Bengalis of the Braho Samaj, many of the strains containing devout aspirations after goodness, wise proverbs for the regulation of life, and earnest thanksgivings to the deity for blessings received.—Pioneer.

FOLLIS, a copper coin, appears to be the same as the Arabic Fals, Flatus, formerly known in Spain as the name of a small coin, Foliz.—Yule, Cathay, i. p. 491.

FOO-CHIOO-FOO, in lat. 26° 7' N., and long. 119° 15' E., is the capital of the Chinese province of Foh-kien. It stands on the banks of the river Min, about 38 miles from the sea. It means happy district. The celebrated fingered citron is cultivated in great perfection, and the district around is the great camellia garden of China. Its ixoras and hydrangeas are also handsome. Early in spring the hill-sides were covered with a beautiful daphne with lilac flowers (Daphne Fortunt, Lindaey), and Azalea ovata, Lindii; and Buddha Lindleyana has its long spikes of purple flowers hang in profusion from the hedges. The hill side, covered with the Glycine Sinensis. One of the most beautiful shrubs of Northern China, the Weigela rosea, was first discovered in the garden of a Chinese mandarin near the city of Ting-hae, loaded with noble rose-coloured flowers. In the hedges the beautiful spring flowering Forsythia viridissima, with several species of wild roses, Spirea Revesiana, clematis, Glycine Sinensis, and the lovely Azalea Sinensis.—Fortune's Residence among the Chinese, p. 27; Wanderings, p. 317.

FOOD.

The food of man is obtained from the vegetable and animal kingdoms, but in by far the larger portion from plants. Flesh and bone and blood, when chemically analyzed, yields the following elementary substances—carbon, hydrogen, nitrogen, oxygen, sulphur, phosphorus, potassium, sodium, calcium, magnesium, iron, manganese, aluminium, copper, chlorine, fluorine, and silicon. These ultimate elements occur in the human body variously combined into compounds, with very different physical properties and chemical relations. Carbon, hydrogen, oxygen, and nitrogen are called organic elements, because no animal cell and no vegetable cell can grow unless the whole of these elements exist. The substances belonging to this group which enter into the food of man are cellulose, starch, sugar, and oil, Cellulose, forming the external membrane of the cells of all plants, is found in all food derived from the animal kingdom. Though similar in composition to starch, it differs from starch in being insoluble; but, as they feed largely on it, it must be extensively taken up into the system of herbivorous animals, carbon, hydrogen, and oxygen, and must be similarly adapted by the human stomach, perhaps with some difficulty, as carrots, turnips, radishes, uncooked vegetables, etc., are not readily digested. Cellulose can be converted into starch by sulphuric acid. Substances yielding starch enter very largely into the diet of man and of the lower animals; and man starch is generally partaken of in the form of
flour, either of grains, of roots, and root-stocks, of the stems and in the seeds of plants. There are few or no vegetables that are eaten that do not contain starch. It is found in turnips, carrots, potatoes, cabbages, parsnips, beans, peas, wheat, barley, oats, and the rest of the cerealia, in all seeds and fruits; but, as with the sago, Portland sago, tapioca, cassava, the various arrowroots, potato-starch, sago starch, etc., it is first, before being used, separated from the other vegetable elements. Starch has the property of combining with water at a temperature of 190°, and forming a gelatinous mass, in which water it seems more digestible. The carrot, turnip, parsnip, cabbage, and Jerusalem artichoke, owe their dietetic value to the starch which they contain; as also the roots of the Arum maculatum, Orchis mascula, inulin from the Inula helenium, lichen starch, found in almost all kinds of Algae, and in the seaweeds. One of these sea-weeds, the Placomena tenax, is known in all the Eastern seas.

Sugar can be converted into alcohol, and it exists in plants dissolved in the water which they naturally contain. It is taken into the animal system to maintain the animal heat, and persons and animals get fat on it. Cane sugar consists of carbon 12 atoms, hydrogen and oxygen each 9, and water 3. Sugar is obtained also from beet, the maple, the birch, the various palms, from the Caryota ureas, Phoenix sylvestris, Ph. dactylifera, Corrypha umbrellifera, Palmyra, Arenga saccharifera, coconut, etc.; it exists also in milk, the grape, in the fruits and other sweet parts of plants, and in the stems of all grasses. The yield of sugar from beet is 8 or 9 per cent.

The alcohol obtained from these by fermentation, in the form of spirits, wines, and beers, is largely used. Although resembling sugar in composition, its effects on the animal system are very different. It acts on the nervous system as a stimulant and narcotic; it is very valuable in medicine, and also of great value to people in health, exhausted by long-continued mental or bodily labour. In excess alcoholic substances are injurious; but amongst the earliest discoveries of every race has been the art of producing intoxicating stimulants. In India, boasting of an ancient civilisation, opium, hemp and its charas resin and bhang, the various palm-wines, the beers from millets, and ardent spirits from cereals and from palm-wines and sugars, have been used from time immemorial. As Mr. Cornish observes (page 15), the effect of those articles in moderation is probably rather beneficial than otherwise. Opium-eating and ganjah-smoking are both occasionally carried to excess, and the consequences, in injury to the nervous tissues of the body, are very similar to those resulting from the excessive use of ardent spirits. The moderate use of all these agents, however, appears to prevent undue waste of tissue in the body, and to render the frame less susceptible to the action of those impalpable but pestiferous poisons which are so prevalent in the soil and atmosphere of tropical countries. The craving for the use of these things undoubtedly arises out of some urgent requirement in man's nature, and the extent to which they are used in Southern and Eastern Asia is perhaps greater than in any part of Europe; in some parts certainly it is so.

Of the nutritious proteinaceous or nitrogenous articles of diet, it may be added that the substance called protein is the basis. Protein is the first element that appears in the development of the vegetable cell. It is consequently universally present in plants. It also constitutes the chief material of the tissues of animals. In the vegetable and animal kingdoms it assumes various forms, and is called albumen, fibrine, and caseine, according to its physical and animal properties. Herbivorous and granivorous animals derive this constituent directly from the vegetable kingdom; the carnivorous obtain it from the plants, through the animals that they eat. Man obtains his supply of protein from both sources.

The fat of animals, ghi or clarified butter, and the sesame oil are almost the sole oleaginous or fatty substances used in the S. and E. of Asia for food. Pure butter is rarely used. These consist of carbon 11, hydrogen 10, and oxygen 1, and their value in the animal economy is as heat-producers, for which they are superior to sugar or starch. The oleaginous principle, however, seems also to aid in the development of the proteinaceous tissues, and to act as a kind of preparation for their growth. In disease, oils are of undoubted value.

Many tables have been published showing the chemical composition of the various substances used as food by man. Perhaps those by Dep. Inspector-General Mayor of the Madras army, Dr. Lyon Playfair, and Dr. Watson, are the most valuable.

The following table shows the composition of food in 100 parts:

L. decorana, ten-cornered gourd.
L. vulgaris, red lentil or boll-gourd.
L. pipo, the pumpkin.
L. melo-pipo, or squash.
Momordica charantia, or small gourd.
Ocimum vulgare, mint.
Raphanus sativus, or radish.
Solanum melongena, chilli pepper.
S. lycopersica, tomato or love-apple.
Trichosanthes anguina, the snake gourd.

With a rapidly-increasing population in all parts of the world, the production of food is an object of the first importance to all classes; and the vegetable substances from which man derives his principal sustenance, necessarily occupy the main attention of the cultivator, while the products form most important staples of domestic and foreign commerce. The breadstuffs of commerce consist of the nutritious cereal grains, the tuberous rooted plants, and the farine yielded by trees. Amongst these are wheat, barley, oats, rice, maize, millet, Guinea corn, the sago of palm, the plantain and banana, the bread-fruit tree, the edible root-crops and starch-producing plants which are a somewhat extensive class, the chief of which, however, are the common potato, yams, cocoy or eddo, sweet potato, the bitter and sweet cassava or manioc, the arrow-root, sago, and other plants yielding starch in more or less purity. Wheat, maize, and rice form very important articles of commerce, and are largely cultivated for local consumption and export, a portion being consumed in the arts, as starch for stiffening linens, etc., and for other purposes not coming under the term of food. The kind of bread in common use in a country depends partly on the taste of the inhabitants, but more on the sort of grain suitable for its soil. The Chinese use little bread, and that little is generally of wheat-flour. In the Punjab, wheat, barley, and millets are consumed in nearly equal proportions; in Berar, Bombay, and Mysore, eighty-two per cent. of the food-growing area is sown with millets; in Bengal, Assam, and Burma, rice is the chief product; in Madras, one-third rice and two-thirds millet. Cakes of wheat-flour prepared on the girdle are a common article of diet amongst the races of Northern and Central India. Further south, on the table-lands of the Peninsula, the natives of India use unleavened cakes made of the great millet, Sorghum vulgare, the spiked millet, Pennicillaria spinata; and the very poor of the people use the hard ragi, Eleusine coracana, in the form of cakes or porridge. Barley is occasionally used to the westward. Cakes made of the flour of the Indian corn, the Zea mays, are scarcely used in India. They are rather less

FOOD.
nutritions than those made from wheat, but more
fattening, in consequence of the greater quantity
of oil contained in it. Along the seaboard,
however, of all the south-east of Asia, in the
deltas and valleys of the great rivers, the Indus,
the Ganges, the Brahmaputra, in all Bengal, all
Burma, in the delta and valley of the Irrawady,
in all the seaboard and near the great rivers of
China, rice is the longed-for article of diet, boiled
and eaten alone, or with a little animal food, or
with condiments made into curry or chutni; or
it is made into the cakes which are sold through
the bazars under the familiar name of ‘appa’ or
hoppers.
In the interior of India, on the table-
lands, other grains and pulses are used, such as
wheat, the various millets, and Indian corn; and
in Northern India, the pulses, chick-pea, the
lentil, and dhal are all in extensive use. But
well-to-do people prefer rice, which is more and
more used as increasing prosperity enables them
to obtain it, and the people speak of using it once
or twice a day or week; to indicate their larger
or smaller means. The facility with which it
may be cooked, the little cost of cooking it, and
its lightness in digestion, are its great recommenda-
tions, the cleaning, grinding, and cooking of
the harder grains costing much time and money.

Rice flour is scarcely ever made into fermented
bread, although it is said to be occasionally mixed
with wheat flour for that purpose. The superior-
ity of wheat to all other farinaceous plants in
the manufacture of bread is very great. Its
essential constituents are starch, also called farina
or fecula, gluten, and a little sugar and albumen.
It is occasionally adulterated with alum, which is
added to whiten the flour, and to enable it to
retain a larger quantity of water. Suit is also
employed in the adulteration of wheaten bread,
to whiten the flour, and enable it to hold more
water, and carbonate of magnesia is fraudulently
used to obtain the same result. In Eastern and
Southern Asia, the ordinary wood bread, the well-
known sago, is made from the starch granules
contained in the piths of several species of palms.
In the Archipelago, sago flour and prepared sago
are largely used as an article of diet, alike for the
robust labourer and for the invalid, and in a
prepared form is extensively exported for the use
of the sick and the nursery. Amongst the Arabs,
burghoul consists of wheat boiled with leaven, and
then dried in the sun. The dried wheat is pres-
served for a year, and boiled with butter and oil.
Leavened bread is called Khubz khamir, and
unleavened bread Khubz fair.

The seeds of all the Gramineae, those of the
damage alone excepted, are capable by cultivation
of becoming alimentary. The value of grains,
generally speaking, is directly as the size of the
caryopsis, and inversely as the thickness of the
pericarp. When the grain abounds in perisperm,
it is heavy; when the envelope is thick, the grain
is, on the contrary, light. Thus—

As Dr. Royle has forcibly pointed out, the
slightest enlargement in the size of a grain, or the
least increase in the productiveness of an ear of
corn, when extended into the agriculture of a
country, will infinitely increase its resources and
revenues.

The chemical composition of the grain influences
materially the quality of the resulting bread.
If the gluten be absent, no fermentation takes
place in the dough; if the gluten be in excess,
the bread is heavy and acid. Wheat flour may
be considered the type of all that is suitable for
alimentary purposes, and in the degree of devia-
tion from this standard consists the inferiority
of the other grains. It is very largely used by
the races occupying Hindustan, Rajputana, the N.W.
Provinces of India, in the Panjab and in Afghan-
istan, but almost wholly in the form of unleavened
cakes or chapatti, prepared on the girdle; for
most of the Hindu people of India, as a rule, are
prohibited by their religion or prejudices from
partaking of food prepared by others, many of
them even of food of which others have seen the
preparation; and as the stricter Mahomedans
object to use leavened bread, from the use of the
toddlies or fermented palm-wines as leaves
unleavened bread, or porridge of flour and
water, with perhaps the addition of salt, are alone
employed. As a leaven for bread, the substances
employed are yeast in Europe, and the palm-
wines or toddies in Eastern and Southern Asia;
and the substitutes for these are sacqui-carbonate
of ammonia, carbonate of soda and hydrochloric
acid, or carbonate of soda and tartaric acid.

Several calculations have been made to ascer-
tain the available supply of food for India. Sir
Arthur Cotton estimates that two acres of rice
land will feed seven people for a year; and Mr.
Fischer, the manager of the Shevagunga estate,
considers that a family of five will consume under
6 lbs. of grain per diem.

It is estimated that in the Madras Presidency,
15 millions of acres of dry land, and 54 millions
of wet land, are devoted to the production of food-
grains; also that an acre of the best rice land
will yield from 1080 Madras measures in the
southern districts, to 1200 measures in Godavery
and Kurnool, i.e. from 30 to 33 cwt.; and the
worst rice land in those two districts varies from
300 to 533 measures, i.e. from 8 to 14 cwt. Pro-
bably, therefore, 20 cwt. of paddy or rice in the
husk, or 10 cwt. of cleaned rice, may be taken as
a good average of produce of irrigated land; and
190 measures, or about 5 cwt., that of dry land,
whether it be devoted to Eleusine coracana or
ragi, Penicillaria specata or cumbo, and Sorghum
vulgar, or cholum, or any other of the unirrigated
crops which form the food staple of the poorer
classes. One acre of wet land will thus produce
as much food as two acres of dry land; and 66
million cwt. of rice, and 75 million cwt. of dry
grains, was the estimated amount of produce in the
Madras Presidency, when it had a population of
26,539,052 souls. This allows about 8 cwt. per
soul per annum. Mr. Dalrymple estimated the annual
yield at 129 million cwt., or 14 lbs. daily for each
person; whereas he considers that a family of
five can subsist on 7 lbs. per day, and three acres
of superior land supposing one acre to be irrigated,
or four acres of unirrigated land, would support
such a family for a year. The Madras Presidency,
with a long seaboard, both imports and exports
largely food articles, the exports exceeding the
imports five or six times, and perhaps one-third
of the population occasionally use animal substances,
as additions to their vegetable diet.

Animals of every class — quadrupeds, birds,
fishes, reptiles, insects, and their larvae — are used
by man as food, and are acknowledged to contain a very large amount of alimentary substances, and these are classed as the nutritious proteinaceous or nitrogenous articles of diet. There are few living creatures in the south and east of Asia, which some one or other of its multitudinous races do not use as food,—the horse, the bullock, the tiger, and all the cat tribe; the dog, birds of all kinds, birds of prey excepted; almost every fish, frogs, snakes, ants, beetles, and their larvae; crustaceans and molluscs of every kind; and the bodies of animals that have been killed or have died, are all utilized. The Hindu Brahman and Rajput and Vaiyasa, as a rule, will not eat animal food, and no Hindu can eat the cow without ceasing to be of the four Hindu castes; but all Sudras Hindu eat sheep, goats, fowls, mutton, fish; and the servile races eat nearly all quadrupeds, many birds and reptiles, amongst them field-rats and frogs. The majority of northern Brahman may and do eat animal food, generally mutton or fish, though priests, while officiating as such, perhaps do not. For although most Hindu priests are Brahman, all Brahman are not priests, amongst them the tribe of Levi furnished the priesthood, so among Hindus it is largely furnished from that of Brahman.

Flesh or fish of any kind is, however, but little eaten by any race or caste in India, owing to their inability to buy it. Even Mahomedans, who may eat all but the pig, only use these in small quantities as a relish with their mainly vegetable diet. Rajput and the hunter and wild races are keen sportmen, and eat what they can kill in the chase, even the flesh of the wild pig; and all sects and all classes of Hindus and Mahomedans make use of milk, curds, and ghee. Scrupulous Hindus will not eat fowls or their eggs. The animal food of which the greatest number would partake is fish, but, as already explained (Fishermen, p. 1120), from this the salt monopoly debars them, though the seas and rivers teem with this form of animal life. From the climate and the gelatinous character of the fish, to be cheaply supplied they need to be quickly cured, and Fishermen effect this take brine with them on their trips. The consumption of fish is merely limited by the cost of the supply. In Canna, too, neither sheep nor oxen are reared, and fish alone are available. The Famine Report scarcely alludes to the available fish supply. But, in para. 69 of their Report, the Famine Commissioners show that the seasons of drought in India have always been followed by scarcity or famine:—

1769. Drought in Bengal.

1770. Famine in Bengal.

1772. Drought in Bombay and Madras.

1783. Drought in Upper India.

1783. Famine in Madras; scarcity in Bombay.

1784. Famine in Upper India, from the Karammee to the Satlej.

1791. Drought in Bombay, Hyderabad, and Madras.

1792. Drought in part of Madras; intense famine in Hyderabad and Southern Mahratta country; severe famine in Dekhan, Gujarat, and Marwar.

1802. Drought in South Hyderabad and in Dekhan.

1803. Drought in Ceded Province of N.W. Provinces and in Central India.

1804. Famine in N.W. Provinces, and scarcity in Central India and Rajputana.

1806. Drought in central districts of Madras, from Trichinopoly to Nellore.

1807. Famine in central districts of Madras.

1812. Drought in Gujarat, Cutch, and Kattyawar, and to some extent in Madras; also in Rajputana and Central India.

1813. Famine in Cutch, Kattyawar, intense in some parts of Rajputana; scarcity in parts of N.W. Provinces and of Madras.

1823. Drought in Madras.

1824. Drought in Bombay.

1825. Scarcity in Bombay, chiefly in Gujarat and Northern Dekhan.

1832. Drought in the northern districts of Madras, except Ganjam; in the south of Hyderabad and the Southern Mahratta districts.

1833. Drought in north part of Bombay, in Rajputana, and in Dehli, Punjab, and N.W. Provinces.

1833. Famine in northern districts of Madras, intense in Guntur; scarcity in Hyderabad and Southern Mahratta districts.

1834. Scarcity in North Dekhan and Gujarat, in Rajputana, the Hidiro district of the Panjab, and the trans-Jumna districts of N.W. Provinces.

1837. Drought in N.W. Provinces, eastern states of Rajputana and south-east part of Panjab.

1838. Intense famine in Central Doab and trans-Jumna districts of N.W. Provinces; also in Delhi and Hissar districts.

1839. Scarcity in North Dekhan, Cutch, and Kattyawar.

1841. Seanty rainfall in Dekhan.

1845. Scarcity in Dekhan.

1853. Food scarcity in Cutch, and in adjoining parts of Madras, Hyderabad, and Bombay.

1860. Drought in part of N.W. Provinces and Panjab, and neighbouring states of Rajputana.

1861. Famine in Upper Doab of N.W. Provinces, Delhi, and adjoining parts of Rajputana; scarcity in Cutch.

1865. Drought in northern part of Madras, in South Hyderabad, and north part of Mysore, in the S. Mahratta districts, and all W. Bengal.

1866. Famine in Bellary, Gajum, intense in Orissa and Behar; scarcity in all adjacent parts of Madras, Mysore, Hyderabad, and Bombay, and in Central and Western Bengal.

1868. Drought in Rajputana, trans-Jumna districts of N.W. Provinces, north and south-east districts of Central Provinces, and in Panjab from Jumna to Indus.

1869. Famine intense in Western Rajputana, and in the trans-Jumna districts of Allahabad and Delhi and Hissar; scarcity in adjacent parts of N.W. Provinces and Panjab, Gujarat, Cutch, and N. Dekhan, and also in the north and south-east districts of the Central Provinces.

1873. Drought in N. Behar, and in part of N.W. Provinces and Oudh.

1874. Famine in Behar, and scarcity in the strip of N.W. Provinces and Oudh adjacent.

1876. Drought in all Madras and Dekhan, Mysore, and south part of Hyderabad, Cutch.

1877. Famine in Madras, Mysore, Bombay, and Hyderabad, very intense.

1878. Famine in N.W. Provinces and in Kashmir; scarcity in Panjab.

In the famine of 1873-74, the cost to the Government of British India was Rs. 6,75,95,700, and in that of 1876-78, Rs. 11,19,43,200.

Buddhists. — The use of animal food is not absolutely forbidden to the followers of Buddha, and all of this faith in Burma use enormous quantities of fish, reptiles, and crustaceas; even the more strict of them, though they may refuse to take life for food, eagerly use flesh when they can get animals killed for them, or find them dead from accident or disease; and the cow, buffalo, and horse are all eaten. The Burmese eat the
tiger, the hyena, camel, monkey, jerboa rat, field rat, bate of kinds, flying fox, flying lemur; and amongst other creatures, the Palolo viridis or sea-worm, and Cordyliæ palmariæ, the grub of the palm palmæ, are eaten by one or other of the races in the south and east of Asia and Australia. In Burma, tiger flesh sells for five annas (7¼d.) a lb. Perhaps no race in the world so largely utilize vegetable and animal substances as the Burmese and Chinese,—the great rivers which intersect the country, and the extended seaboard, providing a large supply of fish, molluscs, and crustaceae.

Chinese.—The great staff of life in China is rice, which is either eaten dry or mixed with water, so as to resemble a soup. Out of rice they make their chief intoxicating liquor, which, when good, is something like strong whisky, both in its colourless appearance and its smoky flavour. Vegetables are largely consumed, such as the sweet potato, yams, melons, peas, beans, turnips, carrots, etc. Of their fruits, the orange, litchee, loquat, and mango, are much in use. Their favourite drink is tea; and the favourite animal food of the poor is pork, the taste for which is national. There is a maxm prevalent among them, that 'a scholar does not quit his books nor a poor man his pigs.' The flesh of the bullock, sheep, deer, dog, cat, wild cat, rat, and horse is eaten, but, compared with that of swine, it is a rarity. Fish are eaten in great abundance, either fresh, dried, or salted; and they rear great quantities of ducks and various species of fowl for the table. The comprehensive principle on which Chinese diet is regulated, is to eat everything which can possibly give nourishment. The luxuries consumed by the very rich consist of the edible birds' nest, beche-de-mer or sea-urchin, shark fins, fish maws, cow sinews, points of stag antlers, buffalo hides, which afford the gelatinous food considered so restorative. Amongst their delicacies also are dishes made of the larve of the sphinx moth, and of a grub bred in the sugar-cane. In China, the various modes of catching and rearing fish exhibit the contrivance and skill of the Chinese, quite as much as their agricultural operations. According to the Repository, at least one-tenth of the population derive their food from the water, and necessity leads them to invent and try many ingenious ways of securing the finny tribes. Great hand-nets and stake-nets are in use, also hand-nets with a diameter of 30 feet, which they throw with a swing over-head; and they teach coromants to fish and bring the prey to the boat. Amongst molluscs eaten, are the sepia, octopus, turbo, hippocus, tridacna, cerithium, arica, holothuria, species of monodonta. Amongst reptiles, the turtle and their eggs, tortoises, frogs, crocodiles, iguanas; amongst crustacea, prawns, shrimps, crabs; amongst birds, all but the carrion birds, and the edible nest of a swallow. Amongst other mammals, the Chinese eat the dog and cat; they and the Japanese eat whales. When Chinese fishermen take one of the huge rhizostoma, which abound on their coast, they rub the animal with pulverized alum to give a degree of coherence to the gelatinous mass.

Dead Animals. — Many of the Dher, Pariah, Mhar, and Chuchill or leather-workers of India eat creatures that die of disease. It is said that, in S. Africa, eating the flesh of animals that have died of peri-pneumonia causes in the eater a malignant putride, and that the virus is neither destroyed by boiling nor roasting. But, after minute inquiries throughout India, no injury seems to result from such food. In 1863, when many horned cattle died throughout Burma, of what was supposed to be the rinderpest ailment, there was a considerable amount of sickness and death from a typhoid fever; but whether eating diseased animals was the cause, was not ascertained.

Milk, butter, ghee, curds, poultry, eggs, mutton, beef and game, are eaten in some form by almost all nations in the S.E. of Asia. The adult Khassa, Garo, and Burmese wholly abstain from milk.

The extent to which vegetable food is produced in India may be estimated by mentioning that 56 per cent. of the population of British India are agriculturists, with 10 per cent. of labourers, most of whom also are employed in the fields. The area cultivated for food-crops is a little more than 1 acre for each individual in the Panjab; 0'76 of an acre in the N.W. Provinces and Oudh; in Bengal, 0'81; Central Provinces, 1'8; Berar, 1'75; Bombay, 1'4; Madras, 0'93; and Mysore and Burma, each 1 acre; and the produce of food-grain per acre is as under:

Punjab. . . . . 11 bushels, or 0'29 of a ton.
N.W. Prov. and Oudh, and Bengal, . . . . 13, or 0'36
Central Provinces, . . . . 8, or 0'21
Berar, . . . . 6, or 0'16
Bombay, ex Sind and N. . . . . 7, or 0'19
Madrass and Mysore, . . . . 11, or 0'3

In the Central Provinces, in 1872-73, the average produce of wheat per acre was in Hushangad only 267 lbs.; Sagar, 324 lbs.; Raipur, 452 lbs.; Narsingpur, 440 lbs.; and Jubbulpur, 600 lbs.—or from 4f to 16 bushels; and that of rice in Balaghat, 360 lbs.; Bilaspur, 426 lbs.; Bhandara, 448 lbs.; Raipur, 602 lbs.; Seoni, 654; and Chand, 675 lbs.—or from 6 to 11 bushels. With periodically recurring famines, and a population increasing at the rate of 1 per cent. per annum, the importance of increasing in India the yield of grain and fodder has become a matter for serious thought. Mr. Lawes of England having shown that in the four years 1874 to 1877 inclusive, in Great Britain, the average yield of 23 kinds of wheat (dressed corn) was as under:

Average bushels, 503 36 421 424
Aver. weight per bushel, . . . . 61½ lbs. 60½ lbs. 63½ lbs. 60½ lbs.
FOOL-SOLA.

The pig, which many races avoid, is used by the Naini Hindus of the Indian Peninsula, and by all the aboriginal races and humbler Christians. Most Hindus avoid crabs, but many eat shrimps. Eggs are eaten by many of the Hindus; and all Hindus partake freely of milk, which the Burman and Chinese in its natural state never touch. Hindus and Buddhists make food offerings to the deity, and bestow the first portion. With the Burmans the act of offering is the merit; and the quantities of food presented at the temple at Prone and at the great Shoo Dagon at Rangoon is so enormous, it is simply got rid of by being all thrown over the wall down the slope of the rock. Hindus make sacrificial offerings to the deity, the elements of sacrifice being a lamp, frankincense, camphor, and sandal-wood, which are burnt, and they eat the sacrificial offering, whatever it be. Food is often presented by Hindus to the pitri or manes of their ancestors; many of the races of Northern India, who follow Brahmanism, cook within a sacred circle, and a stranger stepping within it makes all unclean. A sect of Vaisnavas Hindus will not permit a stranger to cast a look on the food they cook, nor even to look on them while eating; and every Hindu of that sect above the rank of a labouring man, eats his food dressed in a sheet.

It is mentioned, when describing the meal noticed in Genesis xlili. 32, that they set one for himself, and for them by themselves, and for the Egyptians by themselves, because the Egyptians might not eat food with the Hebrews, for that is an abomination to the Egyptians; and so, amongst the Hindus, different castes will not even eat food cooked in the same earthen vessel. If a person of another caste touch a cooking vessel, it is thrown away. Similarly, in Genesis xliii. 34, it is mentioned of Joseph that he sent messes unto them from before him; and this is still the method among some Hindus. The dishes are not placed on the table, but messes are sent to each individual by the master of the feast, or by his substitute. Feasting is everywhere in the East a great social duty, in the manner described 1 Kings i. 8. Food is eaten with the hands, as in Matthew xxv. 29; and after meals, good-washing, as in 2 Kings iii. 11, and Matthew xv. 2. Mark vii. 5, Luke xi. 38.—Eng. R.; Fortune's Residence in China; Robinson’s Travels, ii. p. 132; Tomlinson; Hassall; Statistique des Cereales de la France, par Moreau de Jonnes, quoted by Simmonds. See Agriculture; Fish; Panine; Hubandray.

FOOL-SOLA. Beng. Aeschynomene aspera. FOONG-HANG, the Chinese phonix, a head ornament worn by Chinese ladies, composed of gold and jewels, the wings hovering, and the beak of the bird hanging over the forehead on an elastic spring.

FOOT.

The foot in most oriental countries is deemed the humblest part of the body. It is alluded to in 1 Kings ix. 9, where the Hebrews are mentioned to 'have taken hold of other gods.' When a person claims the protection of another, he casts himself down before him, and lays hold of his feet; and the expression is commonly used, though a person may not prostrate himself, 'I have taken hold of your feet.' 'I will not leave your foot.' When a person is called into the Burman monarch's presence, he is said to go to the golden feet, and a son and his parents will add that he kisses the feet of his mother.

Several oriental nations—Buddhist, Hindu, Christian, and Mahomedan—have marks on rocks, which they believe to be imprints of the feet or of the foot of people whom they reverence, such as that on Adam's Peak, Ceylon, or of Mahomed at the Kadam Rasul Hill near Hyderab. St. Augustine, when landing at Thaet, is said to have left the prints of his foot on the rock. One foot-print is shown as that of Jesus, in a small circular chapel covering the stone which bears the foot-print, on the summit of the Mount of Olives. The ancient Mexicans showed one of the god Tezcatlipoca, and the people of Samoa, one of the Navigator's Islands, showed one of Titi. —Peschel; Frere, Antipodes, p. 257.

FOOTBALL.

Khayy-Jon, , , Bum, Ballone, , , , , Sr. Ballen, .

Football is a favourite game with the Burmese, Malay, and Papuans. In Burma it is woven of rattan, hollow and elastic. The player keeps it dancing a little while on his foot, then occasionally on his arm or thigh, till suddenly he gives it a good blow with the hollow of his foot, and sends it flying into the air. Another player runs to meet it, and at its first bound catches it on his foot, and plays in his turn; six or eight young men form a circle. It must not be struck with the hand, but only with foot, ankle, knee, elbow, shoulder. The game needs agility, skill, and practice. Malay players stand in a circle, larger or smaller according to the number engaged; a ball made of split rattans, hollow, and about 6 inches in diameter, is thrown up by one; the person to whom it approaches receives it on the instep of his foot, and throws it into the air towards his nearest playmate, who in like manner sends it on to the next, and so on. If no player can reach the ball or if he ever loses it during the game, the ball is thus sent round from one to another an extraordinary number of times without falling; sometimes one player will himself, particularly when there are many onlookers, keep the ball in constant motion, receiving it in the fall, now on his foot, now on his knee, elbow, head, shoulder, etc. The ball is a perfect sphere, and is so light, it may be thrown almost with full force against any fragile object without causing injury. The introduction of this playing into Europe would be a great matter in households.—Journ. Ind. Arch. v. No. 11.

FORBES, MAJOR, author of Eleven Years in Ceylon, comprising sketches of the Field Sports and Natural History of that Colony, and an Account of its History and Antiquities, 1840.
FORESTED MEATs.

FORESTED MEATS, or unclean meats, have been amongst almost all races, many of the prohibitions being of the most fanciful kinds. The animals which the Hebrews were ordered to avoid are enumerated in Leviticus xi. and Deuteronomy xiv., viz. blood, animals dying of disease or killed by wild animals, camel, hare, bat, coney, swine, fish without fins or scales, eagle, caracara, osprey, glele, kite, vulture, raven, owl, cuckoo, hawk, night-hawk, swan, pelican, gyr-eagle, cormorant, stork, heron, lapwing, creeping things which fly. Mahomedans adhere largely to the above. They abstain from the animals that do not chew the cud, and divide the hoof; also from scaleless fish and from prawns. Many Brahmans and many Hindus do not eat animal food of any kind, and abstain even from onions from their flesh-like consistence; as also from fowls and their eggs. The Garo and Khasaya hold milk in detestation.

The Chinese and the lower castes of India are almost omnivorous; and Burmans, who are Buddhists, though they will not kill creatures for food, eat any creature which others kill, and eat almost every grain and vegetable. See Food.

FORESTS.

Forec,    F., Biaban,    PERS.
Forec, Wald,    GER. Floresta, Selvosa,    Sp.
Jangal,    IND. Orman,    TURK.
Floresta, Rosco,    It.

Drs. Roxburgh, Royle, Wallich, Gibson, and M'Clelland, for many years continuously, during the earlier part of the 19th century, urged the necessity for attention to the forests of India and Burma. A vast extent of forest land in Oudh, situated on the coast side of the Kerowlee river, was described by Dr. Royle as holding out the prospect of very valuable supplies by the year 1850, provided that means were adopted for preventing wanton destruction, and of allowing the young plants to grow up and supply the place of those which are cut down. Dr. Wallich drew attention to the forests then occupying the islands of the Gogra, commonly called Chandraee Cheko. He represented them as in every way deserving of being preserved for the use of Government, and protected from destructive depredation. The sissou and sal forests of the Dehra Doon were also recommended to be preserved, being as important for the stations in the north-west of India, as the forests of Oudh and Gorakhpur are for those in the south.

Dr. Gibson unceasingly advised the Bombay Government to preserve their forests, and to form plantations of hardy trees; Mr. Dalzell's efforts to preserve the Sind forests were unfruitful; in 1840, 1848, and 1878, Surgeon-General Balfour advised arboriculture.

In 1850, the British Association at Edinburgh appointed a committee to report on the probable effects of the destruction of tropical forests, and the report was presented the following year, 1851, at their meeting at Ipswich. A year afterwards, forest reserves were sanctioned for the Madras Presidency and for British Burma, and by Act vii. of 1865, the Government of India issued forest rules and penalties.

The forests of India had up to that time been injured by the fires of the kumari cultivators and cowherd races, and by reckless felling of wood merchants; whilst no systematic efforts were adopted to preserve or restore. Kumari cultivation has since been prohibited, the firing of forests to obtain fresh grass for cattle has been prohibited, and fire-paths formed, 40 to 50 feet broad, to cut off the fires. Great forest tracts have been reserved, new plantations formed, and seed dillibed in amongst the mass of vegetation.

The report of the committee had reference chiefly to the influence of forests on the climate and productiveness of a country; and it is now acknowledged that the indiscreet destruction of the forests of any country is apt to bring upon future generations three calamities,—the want of fuel, the want of water, and the want of timber; while the appropriation of forest land for purposes of cultivation would not benefit the revenue, as regards climate, the interests of agriculture, the progress of commerce, and the general prosperity of a province, doing so would gradually lead to the most serious consequences. Not only is the rain that falls economized and prevented from rapid evaporation, but the water which sinks into the ground is being continually pumped up from great depths by the roots of the trees, and exhaled by the leaves, thus actually moistening the neighbouring atmosphere in the driest weather, and benevolently affecting the crops of the neighbouring fields. In passing through a tamarisk jungle early in the morning, even in the driest weather, the whole of the foliage is found dripping,—not from dew, but from the water of exhalation brought up from great depths by the vital processes of vegetation; the whole of this passes into watery vapour in a few hours. If forests be cleared away, the neighbouring fields become exposed to the violence of parching winds, and liable to be covered with drifting sand, while cattle find no grazing and no shelter from the scorching heat.

The Sunderbun tract, extending over 3000 square miles, is a dismal swamp, growing timber trees and underwood, its most valuable tree being the Herticia littoralis. The western coast of the Peninsula of India, the country above the ghats in Canara, the Animallay and Pulney Hills, have famous forests, and Mulabar teak has always been held for its superior timbers to that of other places, and with which the dockyards and ordnance department was long supplied. The forests to the eastward of the Salwin river, in Martaban, when visited by Dr. Wallich, were very favourably reported on, for the supply of splendid bamboos as well as teak, for the extent of the forests, the size of their timber, and the facility of procuring it. Subsequently, Dr. M'Clelland reported in the forests of Pegu and Tenasserim, 85 species of soft white wood, many of them valuable either for their fruit, gums, oil-seed, or spices; others, for their close and compact structures, are employed in the manufacture of small ware, as a species of Naucia used for making combs, and two species of Erythrina yield the light charcoal employed in the manufacture of gunpowder. These light woods, useless as timber, belong to the family of the Umbrosae (including more than 20 species of Ficus) and Stephaniae, Laurineae, Rubiaceae, Myristicae, Anonaceae, Spombdineae, and Bignoniaceae, with odd species from other families. Of the remaining white woods: 25 in number, valuable for their strength and closeness of grain, 17 of them were thought fit for house-building, and 8, from the hardness and fineness of their
in rear of the babul forests. The dry belt of the Panjub has woods on the high land between the rivers, composed mainly of Prosopis, Salvadora, and capparis.

The woodlands of a portion of Rajputana are mainly composed of a beautiful tree, a species of Anogeissus, with small leaves and drooping branches.

Sandal-wood grows in the S. dry belt of Mysore. Outside the arid zones, the teak grows in the mountain tracts and west coast of the south of India, where also grow the blackwood trees, poon spar trees, angely, vengay, and irul; and the sal (Vatica robusta) grows in the extensive forests at the foot of the Himalaya, in forests in the Rewa territory, the eastern part of the Central Province, and the adjoining districts of Bengal.

The moist belt along the Himalayan range to Burma and Tenasserim, and that along the western coast of the Peninsula of India to the top of the glats, is covered with luxuriant evergreen vegetation. In the Himalaya are the forests of pines and firs. The deodar has its eastern limit in Kamaon, but is succeeded by the sal in Burma also which, the Pinus Khassayana, extends into Burma. The Ficus elastica, yielding caoutchouc, is found along the foot of the Himalaya from Sikkim to Assam, and more sparingly at the foot of the Khaya and Cachar hills. Assam also has the Mesus ferrea, Artocarpus chaplasha, and Lagerstroemia virgata.

In Burma there are extensive forests of Pinus Khassayana on the high mountains, large teak forests between the Salwin and Sitang, and magnificent evergreen forest vegetation in the moister valleys, where trees grow to a height of 200 feet.

Forests in British Burma cover 4,480,000 acres, or a total of 60,000,000 acres. Of this the teak forests take up 1,504,000 acres; and forests devoid of teak, but in similar localities, 2,945,920. The richest in teak are on the hills between the Irawadi and the Sitang. The destruction of the forests of Acacia catechu has been reckoned. Burma also yields the Xylica dolichocarpa. Teak plantations were commenced in 1856 on the river above Rangoon, and on the Sitang near Toungbo, intended to extend to 30,000 acres.

In Kamaon and Garhwal, the characteristic trees are the chin (Pinus excelsa) and the chair (Pinus longifolia). Below lie the great sal and bamboo forests, which have been much worked, but there is still much timber near the Kosi and Ramganga rivers.

The deodar forests of Gangotri and Jaunsar, N. of the Dehra valley, near the sources of the Tons and the Bhagirathi, the last leased from the Tirthan. In Gorakhpur, sal is the characteristic tree, mixed with terminalia and acacia.

The deodar forests are in the valleys of the Satluj, Beas, Ravi, Chenab, Jhelum, and their tributaries. The forests of the Chamba and Bassahr states are leased by the Government of India. The teak forests or preservs in the Panjub are, between the rivers, consist of about 8000 square miles. Plantations of sissoo and kikar have been formed at Changa Marga in the Bari Doab, 44 miles below Lahore; also on the Jhelum near Lodhiana, and near Delhi and along most of the irrigation canals.

In Oudh, the forests in the Khori, Gonda, and Bharatpur districts are strips cut off from the
Nepal forests on high ground along the Nepal frontier. They consist of sal, terminalia, and conocarpus, interspersed with open glades of grass land.

In the Central Provinces there are great tracts of jungle, but only a small part properly forested. The hills between the Narbada and Nagpur, though covered with trees, contain little timber of value. In the Central Provinces, 2880 square miles of forest tracts have been reserved, 11,000 square miles remain unreserved, and there are 10,000 square miles of timber tracts belonging to private individuals. The teak in the forests of the Mandla district, at the head of the Narbada river, has been ruthlessly felled. Thence to Raipur are extensive sal forests; and the Dela Kari forest near Pachmarhi is the most westerly position of the sal tree in Central India, but further west are remnants of the teak forests of Baitul and Hushangabad, from which the cities of Ujjain, Indor, and Malwa were built. The vast forests to the eastward, the magnificent teak along the Gdavery, and the great sal belt around Chattinga, extend across the centre of India from the head of the Narbada to Cuttack.

In Berar are 646 square miles of reserves. Mysore and Coorg have three great forest belts,—the evergreen on the Western Ghats, yielding angely, pon, ironwood, and blackwood; a moderately moist belt from 10 to 40 miles wide, on the eastern slopes of the ghats, yielding teak and sandal-wood; and a dry region on the eastern side of Mysore, on which grow the Hardwickia, Terminalia, and Conocarpus. In Mysore the reserves are 398 square miles. In Coorg there are 947 square miles, besides the Devada Kadu, or sacred forests.

Forests of Bombay Presidency extend for 500 miles, from Canara in the south to the Mahi river in the north, in the districts of Canara, Tanna, Kolaba, and Kandes, the best tracts being near the line of ghats.

The forests of Sind, called Beya, cover 352,460 acres. They were originally hunting-grounds of the Amirs. They are dependent on the inundations of the Indus, without which they would disappear.

In the Animallay forests of Madras there are reserved teak forests. The Conolly teak plantation on the Beypur river was begun in 1844. The teak seed is steeped in water for 48 hours, and sown on raised beds of fine mould covered with straw, to prevent too rapid evaporation; they germinate in 10 or 12 days, and in the interval are constantly watered. At Mudumalli a plantation of 29,000 teak trees was formed in 1865.

Australian gum-trees were introduced into the Nellicherry about 1850.

Sandal-wood planting has been tried with success in Cuddapah and Kurnool districts, and in the Secur and Collegal ranges of Coimbatore. The sandal-wood tracts belonging to the Government are confined to certain portions of the Coimbatore and Salem collectorates. The tree is often found in hedgerows and low scrub jungle, etc., but is seldom seen in any regular forest. Up to a few years ago, sandal-wood was considered a Government monopoly,—at least none of the ryots ever asserted a right to fell it when found in even their own fields and hedgerows; but upon a sub-collector of the Salem district raising the question, the Government waived any claim to the trees, and they are now generally sold standing by the ryots, to merchants, etc., for a merely nominal sum. Sandal-wood planting has been successfully tried in the Cuddapah and Kurnool districts, and in the Secur and Collegal ranges of Coimbatore. South Canara is held to be a promising field for the extension of the experiment, as the tree is indigenous in portions of that district. Blackwood and catechu trees have been largely planted in S. Canara, and much success has attended the formation of plantations of the babul, casuarina, red sanders, and Pithecolobium saman plantations, the latter being a Central American tree, esteemed very valuable for fuel, the seed of which was obtained from Ceylon. Much has been done for the extension of fuel reserves and plantations, in view of the railway requirements, and too much importance cannot be attached to the addition to the Conolly teak plantations in Malabar, which are an established success. Teak planting is under trial in Kurnool, the Animallays, Bulumputty, Mudumalli and its western vicinity, in the Cumbum valley of Madura, in S. Canara, and the results of hitherto gained are very promising.

The area of the conserved forests of the Madras Presidency is supposed to be more than 5000 square miles. The area of reserves and plantations for railway fuel is about 6200 acres, estimated to yield 67,000 tons of firewood annually; and the area of teak, sandal-wood, etc., plantations is about 2500 acres. From 1860-61 to 1874-75, the balances of receipts and charges ranged from a debit Rs. 59,380 to a credit Rs. 4,28,640, the annual average profit for the period being Rs. 1,11,518.

The reserved Government forests in the Nulla-mallays districts are at an elevation of from 2000 to 2500 feet above the sea, and contain some of the finest blackwood timber in the world. The Cuddapah forests comprise the whole of the preserves, the lands and plantations on both sides of the N.W. line of railway running between Trivupthy and Cuddapah, and are estimated to cover 260 square miles; reserves were established in the districts of Cuddapah and North Arcot, in addition to a large plantation at Ghooty in the Bellary range. The working season in the Animallays lasts from June to November, during which time the forests are almost entirely covered with a dense undergrowth of grass, often growing to the height of ten feet, and swarming with wild beasts and elephants. For the other six months of the year work is impossible, owing to the malaria causing severe jungle fevers. The woodcutters very often refuse to work on account of the large number of tigers and elephants, which prove a source of endless annoyance. These forests are the finest in India, and should be placed under a very strict conservancy system.

The forests of Mysore are those of Bilikal in Kan-kanhalli, and Singapore, Mavakal, and Kachanhalli in Ashtagram, and in 1873-79 had an aggregate area of 442 square miles. Of sandal-wood, 10094 tons were sold for Rs. 3,89,385, and the sales of timber and bamboo produced in 1875-76 Rs. 71,932, in 1878-79 Rs. 34,757.

The aspect of Coorg presents an entire forest; the long and narrow valleys cultivated within it serve but to render the vast woods more striking. The whole of the eastern boundary presents a
remarkable line of demarcation, exhibiting an almost uninterrupted and impervious wood from the Burmargherry Hill till reaching the Chavvey; this space is wholly uninhabited. Advancing westwards, the wood decreases in density as the country improves in cultivation, and becomes gradually thinner till reaching the Western Ghats, the immediate summits of which, naturally bare of wood, are clothed with a luxuriant herbage.

In 1881 there were 16,246 square miles of forest and fuel reserves in Bengal, Berar, Burma, Hindustan, and the Punjab; the Punjab had 15,000 square miles of rack or preserves in its various districts, and there are leased forests in Berar, Bombay, Garhwal, Tehri, Madras, and Punjab.

Under Act vii. an order was issued prohibiting felling of forests at an elevation of 6000 feet or upwards. In 1879 the Punjab Government issued regulations to protect the Hazara forests, providing for their management, grazing, cutting timber within the reserved area, and the creation of village forests, the district officer being empowered to set apart certain areas of the village waste for this purpose. Such areas are the crests and slopes immediately below the crests of hills, the catchment-basins of rivers, all steep and rocky slopes and other situations of which the clearance is, in the opinion of the district officer, unavoidable. And in the case of other kinds of lands, a majority of the landowners, representing two-thirds of the revenue, may apply to the deputy-commissioner to have a tract set apart as village forest. Squatting, breaking up the soil, cutting trees or brushwood, barking trees, or grazing cattle contrary to the general orders, removing dead leaves or kindling fires, are prohibited within a village forest. Also the district officer can require the owner of any cultivated land on a hill-side to take the necessary steps for ensuring the stability of the soil; and also, in ease of erosion of a river's banks, or of risk of torrent action, or of the occurrence of landslips, to enclose and plant the necessary area in such manner as most effectually to guard against the threatened danger. The areas so enclosed are to be regarded as a reserved forest, and the owner is to be compensated as though it were taken in the survey.

The forest's wild products vary in different parts, but honey, wax, roots, fruits, gall-nuts, ginger, turmeric, cardamoms, dye-powder, resin, and various fibres are obtained yearly from the forests of the Madras Presidency. Cinnamon bark, cinnamon flower, resins, gall-nuts and bamboo sprouts, in Malabar. The most valuable of these products is cardamom; but a large quantity of this spontaneous crop is never gathered, and all efforts to collect it are failures, as the jungles are uninhabited by human beings, and wild animals take shelter in them. Cinnamon bark and flower are procured, the former by stripping the trees, and the latter by plucking the flowers when in blossom. Nagabetta (a species of cane) is carried away in large quantities by wayfarers and pilgrims frequenting the temple at Subramania, where they grow largely. The Government of Madras has repeatedly declared that they will not sanction any step in the direction of monopolizing the forest products, the collection of which affords the only employment and means of subsistence open to the inhabitants of wild forest tracts.

The gross revenue derived from the Indian forests, in the ten years 1872 to 1881, was £6,204,977, and the charges £1,407,554. The importance of forests to tropical climates, as inducing rain and preserving surface-water, is recognised. The extensive clearing of a country diminishes the quantity of running water that flows over it. Rain often fails, and more dew is deposited, in well-wooded countries; where the country is naked; mountains, when covered with their native forests, gather clouds around their summits, condense the humid particles of the air, and equalize the fall of rain; lands destitute of the shelter of trees allow of a more rapid evaporation; forests preserve the surface-water, and husband and regulate its flow.—Noble's Productive Resources of India; M'Clelland; Cleghorn in Yearbook of Facts, p. 263; 1868; Scindian, July 12, 1856; Annuals, Indian Administration, March 1861.

F. CINNAMONI. An extensive family of Hymenopterous insects, belonging to the section Aculeata, sub-section Heterогyna, Latreille, comprising the numerous tribes of ants. The family is distinguished by the wingless state of their abortive females, by the great length of the basal joint of the antennae in the females and the neuters, in which they are elongated at the extremity of this joint, and by the first or the first and second segments of the abdomen being knotted; the upper lip of the neuters is large, horny, and perpendicular, falling between the jaws; the eyes are rounded, or oval and entire, the form of these organs varying greatly in many of the species. In their structural character the Formicidae resemble the Tiphiidae and Darylida belonging to the section of the sand-wasps. The neuters are smaller than the males, and these are smaller than the females; the abdomen in the first and last of these sexes is composed of six segments, in the male of seven. The females and neuters are furnished with a sting in many of the species. Those species which have stings emit an irritating fluid into the wounds which they make, while the stingless species discharge a red transparent fluid on to the skin, causing painful blisters. The various genera of this family, according to Latreille, are—F. Crematogaster, F. Fomica, F. Myrmica, F. Polyrhachis, Atta. This last genus differs from Myrmica only in having very short palpi; the head of the workers is generally very thick. The 3d Tribe Formicidae contain those ants that have no sting, and the abdominal pedicle is of one knot only. It comprises two genera, Polyrhachis and Formica. The Formica genus is distinguished by having the footstalk of the abdomen composed of a single joint, the mandibles triangular, and dentilicated at the edge. The females are destitute of a sting. The neuters are about one-third of an inch long, of a black colour, with the thorax, abdominal scale, and a large part of the head red. It makes its large conical nest in the open ground in woods, etc., amassing together large quantities of sticks, straws, etc. Dr. Jerdon notices in India F. ammon, angusticollis, assimilis, carinata, cinereascens; compressa, besta, undulosa; longipes, phyllophila; reclusa, rufe-glancea, acerina, amarargida, timida; vagans, velox, stricta, and sylvicola. The fondness of F. indefessa, Sphen, for sweet substances is very great. F. gigas is more than an inch long.

F. compressa, Fabr., well known as the black ant, is found throughout every part of India.
FORMOSA.

except the western coast. It lives in very numerous societies in the ground, the entrance to the nest being often round the trunk of a tree, or close to some building. The warriors are very numerous. Their food is chiefly vegetable secretions, sugar, etc., and Colonel Sykes has given an interesting account of the devastations committed by them on preserves, sugar, etc. They bite rather severely, but the pain is quite momentary. At certain times great numbers of the winged males and females are seen at the mouth of the nest, and they remain there for several days. When they take wing, they do so in vast numbers, and always at night.

F. smaragdina, Worker, the red ant of India, Diniya, Singo, of a uniform pale rufous. Male of a rufous colour. Female of a pale shining green colour. The red ant is well known in Malabar and the wooded parts of India, but is rare in the Kurrutic. It forms a nest of living leaves, which it draws together without detaching from the branch, and unites with a thin white web; some times this nest is above a foot in diameter, but usually smaller. The society consists of a vast number of individuals, and in large nests are many females and males, both with and without their wings at all times of the year. They are very bold and pugnacious, and bite very severely. They live chiefly on vegetable secretions, and are very partial to the flowers and buds of some of the loranthis, which abound on the western coast. They often form a temporary web round the flowers, or sometimes round the fruit, of various trees, viz, the Eugenia Malaccensis, Artabotry odoratissima, etc., apparently only for the purpose of feeding undisturbed. They will, however, also sometimes feed on decaying animal matter. It is said that the web they form is occasionally used for writing on in the N.W. Provinces of India, and that these ants are made use of to destroy a nest of wasps that have settled themselves in a box. They are said to destroy all the wasps, but to become so infuriated, that their own indiscriminate attacks are nearly as bad as those of their foes. In gardens they are most partial to mango trees, but in the jungles they make no selection.

F. timida, Jerdon, the small red ant, has all the body covered with long scattered hairs; only found on the Malabar coast, where it is very common, living chiefly on vegetable secretions. It has its nest under ground. It is timid, if approached or touched, dropping to the ground at once and hiding itself. On one occasion pigeon squabs placed in a room on the floor were found killed by these ants, chiefly, however, the warriors.

F. velox, Jerdon, colour blackish, abdomen greenish pubescent. Very common in Malabar, and also found in the Kurrutic. It frequents flowers, especially delighting in those that have great quantities of pollen, such as the Cucurbitaceae, Hibiscæ, etc. It runs very speedily, and is very easily alarmed, dropping to the ground on being touched. See Ants; Insects.

FORMOSA or Pファッション Island, called alsoTy-oan, is about 210 miles in length from N.N.E. to S.S.W., its south point, called the Cape of Formosa, being in lat. 21° 53'/2 N., long. 150° 53'/2 E. It is 20 to 80 miles wide, and is traversed down its centre by a mountain range, which rises to 8000 feet in the south and 12,000 feet in the north half; the valleys and higher slopes are clothed with trees. As yet only 36 species of its mammals and 128 of birds are known, several of them identical with the species of India and Malay Peninsula; 49 of its land birds are peculiar to the island. Formosa is part of a chain which lies along the Asiatic continent, and forms a distinct and well-defined ethnic and geographic group, which includes all the Japanese and Aino islands from Formosa to Kamtschatka; and Mr. Logan proposed to call it Aino-Japanesia. It was known to the Chinese a.d. 1431. It was held by the Dutch for a short time. The western coast is occupied to a great extent by recent settlers from China, but the interior is inhabited by several rude tribes, whose language differs from the known Formosa. The aborigines, called Kebalan, are short in stature, of tawny complexions, and lank hair. Although inhabiting a great and fertile island, affording to all appearance a fair opportunity of development, they have never made any progress of civilization, and at present seem to live in a state of barbarism. The language of Formosa, according to M. de Rosnay, is to be a branch of the Oceanic, which, however, belongs to a state intermediate between the monotonic and the inflectional; words of the Malayan languages are to be found in the language of the aboriginal inhabitants. In the north-western portion of the island sulphur mines are frequently met with, presenting blots in the otherwise beautiful scenery. The gigantic laurels from which the camphor is obtained are found on the mountains in the possession of the aborigines. In the neighbourhood of Tamsuy alone, 800,000 lbs. of this valuable commodity are produced annually. Petroleum also adds to the riches of the island, which, both from its natural and artificial products, is well worth a struggle on the part of the Japanese to obtain, and on the part of China to defend. Areia papyriforma in Formosa does not exceed 6 feet high. Forrester places the Empolocamus Swainboi.—Ind. Arch. Supp. ii. pp. 318-358; Japan, 410; Loo-choo; Horsburgh; Latham's Descriptive Ethnology; Adams; Cornhill Magazine; Jour. India Arch.; Maryat's Ind. Arch. p. 41; Dr. Colllingwood, Trans. Ethn. Soc. N. S. vi. p. 139; A. R. Wallace.

FORREST, CAPTAIN THOMAS, author of Voyage to New Guinea and the Moluccas from Balambangan, in 1774-76, with a Vocabulary of the Magindano Tongue, Lond. 1780.

FORSKAL, PETER, a native of Denmark or Sweden, who travelled in Arabia and Egypt, and wrote the Flora Egyptiaca, Arabica, and other works.

FORSTER, GEORGE, an early traveller from India to Europe. He proceeded by land from Bengal to the Caspian Sea, and from thence by the ordinary route on the Volga, etc. to Peters burg, in the year 1784. He avoided the country of the Sikhs. He wrote Journeys from Bengal through Kashmir, Afghanistan, Herat, Persia, Petersburg, etc., to England, Lond. 1808.

FORSYTHIA VIRIDISSIMA, a beautiful flowering plant of China; it blossoms in springtime. Forsythia suspensa, Smith, Lien-kiau, Chin., is obtained in Shen-si and other Chinese provinces; the fruit, leaves, and root are used medicinally.—Smith.

FORT GEORGE, the fortress of Bombay. Fort
Gloucester, a fort now in ruins, is on the left bank of the Hooghly river, about 15 miles below Calcutta. Fort Golconda, a fortress on a rocky hill on the left bank of the Secna river, five miles W. of the city of Hyderabad in the Dekhan; its builder is not known. It consists of an enceinte, with bastions and a citadel. After a siege of seven months, it fell by treachery in the end of September 1687. Fort St. David, a place in the Karnatic at Behoor; between it and Pondicherry, Major Lawrence, in August 1752, entirely defeated the French army. Fort St. George, the fortress at Madras, built on the principle of Vuban. Fort Victoria, the name given to Bencooe, after its surrender to Commodore James on the 8th April 1756. Fort William, the fortress of Calcutta; it was constructed by Lord Clive.

FORTUNE, ROBERT, a scientific horticulturist, who collected many rare plants in China, in the middle of the 19th century; obit 1860. His first voyage was made in 1842, for the Horticultural Society of London. During four years' wandering, he discovered several new useful and ornamental plants, which now adorn the beauty gardens of the world. He was in 1848 deputed by the Court of Directors of the East India Company, and upwards of 20,000 tea-plants, eight first-rate manufacturers, and a large supply of implements, were procured from the finest tea districts of China, and conveyed in safety to the Himalayas. This journey occupied altogether about three years, and he returned to England at the end of 1851. He was deputed again in 1852, for the purpose of adding to the collections already found, and of procuring more tea-makers. He was occupied in this undertaking for nearly three years, and the result of his mission was considered very satisfactory. His fourth voyage was made in the service of the United States Government, to procure a very large supply of tea-plants, for trial in some parts of the American Union, and other choice productions desirable to introduce. He wrote Residence in China, and Wanderings in China.

FOSSILS. Cotton contains fossil along with lignite in the thin beds of the Malabar coast near Trivancore, and on the east coast of Africa. It was first found in the blue clay at Highgate, near London; it occurs also at Wochlow in Moravia. It occurs in irregular pieces or small nodular masses. Its colour is yellowish or dull brown, nearly opaque; lustre resinous; fracture conchoidal; sp. gr. 1:046. When heated it yields an aromatic odour, and melts into a limpid fluid; it burns with a yellow flame and much smoke. When strongly heated in contact with the air, it is totally dissipated.

Fossils are very abundant in Southern Asia, all along the seaboard; west of Pondicherry, and near Trichinopoly; in Hyderabad and the Central Provinces; in the valley of the Nerbadda, in all the coal tracts, in the Siwalik Hills, and in Burma. Of those found in Burma by Mr. Oldham during his companionable English garden. He was the following - elephant tusk and lower jaw; mastodon lower jaw and molar tooth; rhinoceros tooth; tapir lower jaw; deer; sus or merycopotamus, portion of cranium; gastral fragments; bones of the pachydermata, ruminants, crocodile, tortoise, large tortoise.

Sir Proby T. Cantley carried on extensive researches in conjunction with Dr. Falconer, in the fossil remains of the Siwalik Hills. They presented to the British Museum an extensive collection of fossil mammalia from the Panjab Siwalik. At Cutchavally, north of Trichinopoly, there is a bed of calcareous clay, in which recent shells and crustacea, principally Macrophthalmus and Scolyia, are found in a semi-fossilized state. The broecca at Jaffna and the arenaceous strata in the western coast of Mannar and the neighbourhood of Galle also contain recent shells. These fossils, when powdered, are used by the Arabs as a specific for diseases of the eye. The siliagrams which the saiva and vaishnava Hindus worship are fossil water-worn ammonites, found in part of the Gandak river in Northern India. The bin-lung, rori, and choolia stones found in the whirlpools of the Nerbadda and Chambal rivers are also worshipped by Hindus; but they are not fossils, merely stones rounded by attrition. Numerous fossils are obtained in the Baloti range and in the Shikha Booden Hills, which may be considered offshoots from the Salt Range. Fossils also occur in the Lagari, Mazari, and Lower Hills and the Sultani range. A specimen of eubay is found fossil in the Lagari Hills, Inam Bakhsh Khan, and Dhehra Ghazi Khan, and the curious trilinnet markings on it are compared by the people to the impression of a bird's foot, to which accordingly they attribute the origin of these fossils. The natives regard the larger fossils of the Mazari Hills as the petrifed clothes of fifty betrothed virgins, who, while bathing, were surprised by their future husbands. They prayed Heaven to grant them a covering; in answer to this the earth swallowed them up, and their clothes became stones. In the Panjab, a fossil encrinite is used in medicine, under the name of Sangi-i-yahudi, or Jew's stone; and the Sangeha, a nummulite from Dhehra Ghazi Khan, and Sang-i-shad-naj, another nummulite, are also used in medicine.

The Delhi system of hills includes those of the Dehli, Gurgaon, and Hissar districts, also the Shekawati Hills in Gurgaon, which ultimately become fused in the Sultani range. Some of these hills are fossiliferous, others yield metals, the copper of Hissar and Sighnanga in Gurgaon district belonging to this series. In other portions marbles and freestone are found; and the Kalyana Hills of Dadi, now included in the Jind territory, furnish elastic (micaceous) sandstone.

Spiti yields ammonites, astarte, belemnites, species of nucula, othocera, pholadomya, rhyconella, and spirifer.

The Shih-yen of the Chinese are fossil shells, species of spirifer and rhyconella, used medicinally. Fossil wood is found abundantly in Burma, in the Kyen-dween, and Namloroung.

Fossil wood in the sandstones at Triviciary near Pondicherry, at the village of Verdur Valadugar, four miles E. of Triviciary, and other fossil send in British India and Ceylon, were described by Mr. Edward Forbes. The Triviciary fossil wood is embedded in a coarse silicious conglomerate. The conglomerate in Siind consists chiefly of the rolled fragments of the nummulite and other sub-adjacent rocks. In the cliff at Minors, near Kurachee, adjoining beds of oysters and other sea-shells, in situ, along with fossil wood like that of Cairo, and fossils nearly identical.
This plant flowers when 10 or 15 years old, and when 20 or 30 feet high.

Fourcroya Gigantea. Vent. Sinai katalay, TAM. The great aloe, one of the Amaryllacee, has been introduced into India from S. America. It is remarkable for its leaves, which are often 10 feet long. It yields a fibre 5 or 6 feet long, somewhat finer than agave fibre, but possessing similar properties. It is less abundant than the agave, but is as easily propagated. In preparing its fibre, called into fibre, the leaves, cut close to the stem, are placed on piles of old board, and beaten with a short stout stick. After being bruised, the pulpy portions are scraped out with a blunt knife, and the fibres are subsequently washed in clean water and dried in the sun. Its long and strong fibre deserves more attention than is given to it. The agave and fourcroya are similarly called alocos, and their fibres, aloc fibre. They are capable of enduring a great variety of climates, and are all rapidly extending over India; but they are not yet sufficiently abundant, the Fourcroya gigantea especially, to yield the fibre in large quantities.—M. E. J. R. See Fibres.

FOWLS.

Kì; Chuh-ye ... CHIN. Murghi ... HIND. Ouph ... HERB. Kohl ... TAM.

Though in numerous breeds and sub-breeds, all the domestic fowls seem to have diverged from a single type. The game breed is from the Gallus Bankiva, called also G. ferrugineus. Its feathers are closely depressed to the body; it is indomitably courageous, evinced even in the dispositions of the hens and chickens. It is of various colours.

Malay fowl, with body of great size, disposition savage. Cochín or Shang-hai breed, of great size, of Chinese origin, and disposition quiet. Bantam breed, originally from Japan. Creepers or Jumpers, from Burma, with monstrous short legs.

Frazzled or Kafir fowls of India, with feathers reversed. Silk fowls, with silky feathering; and Sooty fowls of India, the hens of which have a white colour, stout-stained, black skin and periosteum. Gallus Bankiva does not range into the northern parts of India; part of its halescons consist of highly peculiar horny lamine, and it is not now believed to be the parent bird of the domestic fowl.

Gallus Stanleyi is peculiar to Ceylon, and greatly resembles the domestic fowl.

Gallus varius, called also G. furcatus, is met with in Java, and the islands of the Archipelago as far east as Flores. It has green plumage, unarrated curb, and single median wattle.

Gallus Temminckii is supposed to be a hybrid.

Gallus Bankiva, inhabits N. India as far west as Sind, ascends the Himalaya to a height of 4000 feet; inhabits Burma, the Malay Peninsula, Indo-Chinese countries, and the E. Archipelago as far as Timor.

The Europe breeds, Dorking, Hamburgh, Andalusian, Spanish, Sultans, Ptermian, Ghoaondook, Rumpless, are unknown in S.E. Asia.

A long-tailed variety occurs in Corea; the kind with feathered legs, known in England as Cochín-Chinese, are obtained in Ho-nan. In China, a cock is used in sacrifices, and is not to be used on occasional occasions. Black-boned fowls are in China prized to make soups for persons with lung diseases.

Fowls are not mentioned in the Old Testament, and are not figured on Egyptian monuments. They are figured on some of the Babylonian cylinders, n.c. 600 and 700. The Institutes of
Fox.

Menu permit the wild fowl to be eaten, but forbid the domestic fowl, and Hindus avoid domestic fowls and fowls' eggs. At the present day, most of the pagan tribes on the east coast of Africa, from 4° to 6° south of the equator, hold the fowl in aversion. Caesar informs us that the Celts of Britain would not eat the hare, goose, or domestic fowl. The Rajput will hunt the first, but neither eat it nor the goose, sacred to the god of battle (Haa), and rarely the domestic fowl. The domestic fowl is eaten freely by Mahomedans, and they are largely reared for the table.

Fowls are sacrificed by the Yazidi of Kurdistan. The Assyrians worshipped the cock. The Jews of the East offer a cock for man and woman as an atonement. Socrates, when dying, desired a cock to be sacrificed to the god of health. Fowls fatten best when kept in the dark. In India their eyelids are sewn together.

Fowls' Gizzard, Ki-lui-kin, Chun-pi of the Chinese. The inner lining of the gizzard of fowls is peeled off and dried, and given medicinally in dyspepsia, spermatorrhoea, and urinary disorders.

—Darwin; Tod's Rajahstan; Smith. See Cock; Gallus.

India has three foxes,—

Vulpes Bengalensis, Shaw.

Canis Bengalensis, Gray. Vulpes coraee, Blith. V. Bengalensis, ;
Kokree, Sykes. V. indicus, ;
C. rufescens, Gray. V. fulvaee, ;
Vulpes indicus. V. kockree,
Lomi, Loomri. DUKH. Bengal common fox, Eng.
Noomri, .

Lives in the entire of India and the adjacent countries, but varies both in size and colour in different localities; is generally of a greyish brown with a fulvous cast, passing in some cases to Isabella; it is always variegated above with an intermixture of whitish hairs. It is a very pretty animal, but much smaller than the European fox, with a short head, very sharp muzzle, oblique eyes, nut-brown irides, very slender legs, and very bushy tail, trailing on the ground. Its principal food is rats, land-crabs, grasshoppers, beetles, and fruit; the mango, the custard apple, are largely eaten. It always burrows in open plains, runs with great speed, doubling like a hare; but instead of stretching out at first, like the hare, and trusting to its turns as a last resource, this fox turns more at first, and if it can fatigue the dogs it then goes straight away.

Vulpes flavescens, Gray.

Vulpes montana, Hodg. | Robur in Kandahar.

This species is numerous in the valleys around Kandahar, hiding in burrows and in holes in the rocks. It is about two feet long from the nose to the insertion of the tail, and the tail is about seventeen inches; height at shoulder, about fifteen inches. Its tail is yellowish; back rather darker, inclining to brown; face and outer side of fore legs and base of the tail fulvous; spot on the side of the face just before the eyes; the chin (breast), the front of the fore legs, a round spot on the upper part of the hind foot, and the tips of the hairs of the tail blackish; end of tail white, and ears externally black. The skins are soft, and are made into the nimchah and postin overcoats.

Vulpes montanus, Pearson, the hill fox.

Canis montanus, Pears. Vulpes montanus, Gray. C. HIMALAIUS, Ogilby. | V. Nilgarensis, ..

The hill fox of India dwells in the Himalaya, ranging up to the snow limits; and in winter, when the snow is on the ground, they are very numerous about Simla, coming close to the houses in search of offal. Its fur is exceedingly rich, dense, and fine, the longer sort measuring fully two inches upon the back, and the inner everywhere of considerable length, and of a woolly character. General colour, pale fulvous; head mixed with white; tail bushy and white-tipped.—Horsfield's Cat; Col. Sykes: Jerdon.

FOX ISLANDS, or Aleutian Islands, in the Northern Archipelago, on the west coast of America. This name was given to the whole group (16), on account of the great number of black, grey, and red fowls with which they abound. Lat. 52° 56'N.

FRAGARIA, the strawberry genus of plants, of the order Rosaceae. Some wild species occur in India, and others are cultivated. F. Chiensis, Ehr., the Chili strawberry, was brought from S. America. F. collina is also an introduced plant. F. elatior, Ehr., is the bush strawberry from America; and F. grandiflora and F. jamaicae are also known, as also F. Roxburghii, W. and A., the F, Indica of Roxburgh, which has also been classed with Duchesnea and Potentilla, growing in the Neillherries, Dehra Doon, and Kamaon. Fragaria vesca, Shie-mei, Chin., is the wood strawberry.

Fragaria Indica. Andr. Wild strawberry.

Klang of . | JHRUM. Banaphul of . | SUTLEJ.

Ingrang, Yang, Tash, KANG. Tawal of . | TR. IND.

This grows wild in most parts of the Panjab and Himalaya, from 4000 to 12,000 feet, in Kamaon, Dehra Doon, Neillherries, and Penang. The fruit is excellent when gathered dry, but is largely improved by cultivation. See Strawberry.

FIRA JOAN, an Augustinian monk, who reigned for many years as a petty sovereign on the island of Sundwa, about the middle of the 17th century.

FRANCE, a country of Europe, which, in the 18th century, nobly made exertions for empire in the East. They occupied Madagascar, also the Isles of Bourbon and France; formed a factory at Surat, and one at Musulipatam; were repulsed at Galle, but took, and again lost, Trincomalee; settled at Pondicherry, which they surrendered to the Dutch. They took and abandoned Surat, but founded Chandernuggur, conquered Malac, obtained Kirikal, repulsed the British fleet off Negapatam, took Madras. Defeated Mafuz Khan near Madras, at Sadras, and St. Thomé, but were surprised at Cuddalore, twice repulsed and forced to retire. They were besieged in Pondicherry, but repulsed the besiegers. They gained the battle of Amboor, when Anwar-ud-Din fell; surprised the camp of Morari Rao; defeated Muhammad Ali, son of Anwar-ud-Din, stormed Ginji; defeated Nasir Jung; defeated the British at Volonda. They were shut up at Trichinopoly, where they were twice defeated by Olive, and
retracted to Seringham, where they subsequently surrendered to the British. They afterwards defeated the British at Vizcruvandi, but sustained a defeat at Sainte Marie in 1763. They repeatedly defeated theMaharras, obtained great power, under M. Bussy, at Hyderabad, and obtained the cession of four provinces on the eastern coast. They defeated the British at Teruvadi, but were defeated at the Golden Rock, at the Sugar-loaf Rock, and took refuge in Seringham; were repulsed at Trichinopoly, but surprised the British and Contarapa; made peace with the British, and refused to aid Suraj-ud-Dowlah against the British. Subsequently, at Negapatam, they were beaten, but took Cuddalore and Fort St. David, and were repulsed from Tanjore. They were beaten off Tranquebar, at Condore, and off Fort St. David and at Wandiwash, and surrendered Pondicherry. Their efforts ceased from the 16th January 1761. By the treaty of Paris in 1763, Muhammad Ali was declared an independent sovereign. They are a brave and conquering nation, and had able leaders, but the officers under Dupleix and Bussy were inferior. France now holds the island of Bourbon, or Reunion, in the Indian Ocean; also settlements on the coast of Madagascar, at Nosse Bé, the island of St. Marie, and at Bati Bé; the island of Mayotta, one of the Comoro group, was purchased also, in 1841, from a chieftain, and converted into a colony. In Cambodge France has 56,000 square miles of territory, with a population of 750,000 souls, and exercises a protectorate over Annam.

The remaining French possessions in India consist of five towns, Chandernagur, Karikal, Pondicherry, Yanaon, and Malpe. The total square miles of these is 194, with a population of 205,997. Pondicherry was restored to France by the peace of 1768; in 1778, again taken by Sir Hector Monro, to be restored by the treaty of peace of 20th January 1788. Captured again in 1793; again restored by the peace of Amiens in 1801. Recaptured in 1808, and finally restored in 1814 and 1815. France sends annually to British India above half a million sterling of merchandise, and takes to the value of eight millions.

During their greatest efforts, Admiral de la Bourdonnais was employed by sea, and Dupleix and Bussy on land. Many eminent men of this nation served in India,—the younger Lally, Law, Dupleix, Bussy, De Suffren, De Boigne, Perron, La Bourdonnais, Guerene, Jean Baptistc, Raymond, and Bernadotte, who was subsequently king of Sweden. The noticeable era of the French power in India was but of short duration, but remarkably brilliant while it lasted. It commenced under the government of M. Dupleix in 1748, and was extinguished by the surrender of Pondicherry in 1761.

In 1601 they had sent two ships to India from St. Malo, under the command of Lieutenant Bardelieu, but both were lost off the Maldives. In 1604 Henry Iv, incorporated the first French East India Company, which the minister Colbert in 1664 re-established on an improved footing, granting a monopoly of the trade for fifty years. In 1668 Surat was selected as their first settlement; afterwards Trincomalee was taken from the Dutch, but soon again recaptured. In 1672, St. Thomé, now a suburb of Madras, was taken from the Dutch, but in 1674 it was again restored to them, and the same year they occupied Pondi-
FRASER, JAMES.

wrote on the geology of Bundelkhand, and on the Punna diamond mines.

FRASER, JAMES BAILLIE, author of Journey from Constantinople to Tehran, and Travels in Persia; also Travels in the Caspian Provinces of Persia; also Journal of a Tour through part of the Himalaya Mountains and to the Source of the Rivers Jumna and Ganges, 4to, Lond. 1820; also Narrative of a Journey into Khorasan in 1821-22, with an Account of the Countries to the N.E. of Persia, 4to, Lond. 1825; also Travels in Kordistans, Mesopotamia, etc., with Sketches of the Character and Manners of the Kordish and Arab Tribes, 2 vols. 8vo, Lond. 1840.

FRASERPET or Khushhal Nuggur, a town in Coorq, 19 miles N. of Mercarn, on the left bank of the Cavuery, in lat. 12° 26' N., long. 76° 8' E. It was named Khushhal Nuggur by Hyder, but takes the name of Lieutenant-General Fraser, the first Commissioner of Coorq.

FRAXINUS, the ash tree, of the Ash family, of the Ash tribe, and of the Hebrews. Two species of the genus Fraxinus grow in the Western Himalaya,—F. floribunda, or large ash, and F. xanthioides, or crab ash. They grow in the Meico forest, near Abbotabad, Hazara; and in the valley of the Sutlej there is abundance of yew and olive, and a considerable quantity of box and ash, the ash and olive near the river, but the box and yew on the higher slopes, 2000 feet or more above the Sutlej. The larger ash and yew are much esteemed for jampen poles, hefts, and tool handles, etc.; and the larger, in colour, grain, and toughness, resembles the English ash, and makes good walking-sticks. Some species of ash are remarkable, like the sugar maples, to which in some respects they are allied, for the sweetness of their sap, which, on concentrating by exposure to the sun is known as manna. To the two species, F. rotundifolia and F. floribunda, and probably also to other species, we owe the manna. Ornus florifera, the flower bearing ash tree, grows in the mountains of the south of Bokhara, and F. rotundifolia (Orna rotundifolia), the round-leafed manna ash, is a native of Calabria and Sicily. The wax insect tree of China, F. Chinesis, grows abundantly on the banks of ponds and canals in the province of Chito-hiang. When the insect, Coccus pela, Westwood, is fully developed, the trees seem as if covered with flakes of snow. The wax is of great value in Chinese commerce, and a small portion is exported.—_Fortune's Residence_, p. 146; _Cal. Cat. Ez._ 1852; _Cleghorn, P. Rep._; _Royle, Him. Bot._ p. 266; _O'Sh._ p. 434.

FRAXINUS FLORIBUNDA. Wall.

_Sinna, Shinna, CHEMAB, Susu, _Ravi._

_Sinna, _JHELM, Uga, Shing, _Tr. IND._

_Hum, Hauz, _KANGRA, Banaah._

The large ash is found on the Thandian and Mochputa ranges of the Himalaya, but not in Kaghnn. It is a handsome tree, with a deeply furrowed bark, growing to 15 feet in height and 15 feet in girth. The wood is excellent, possessing most of the qualities of European ash. It is valued for jampen poles, ploughs, platters, spinning-wheels, etc., and in Kashmir is reckoned by far the best wood for oars.—_J. J. Stewart, M.D._; _Cleghorn, Punjab Report_, pp. 80, 177.

FRAXINUS XANTHOSTYLOIDEE. Wall.

_F. Moorcroftiana, Wall._

_Butru, Sandal, CHEMAB, Chitta, Chuj, KANGRA._

_Shangal, _ENGL, Chun, Thun, _SUTLEJ._

_Nuch, Hauz, _JHELUM, Shing, _TR. IND._

_Shill_,

The crab ash is a small shrub or small tree. It grows in the N.W. Himalaya, and is found in the Sutlej valley between Rampur and Sungnam at an elevation of 7000 feet, and in Tibet up to 12,000 feet. It rarely reaches a girth of 5 feet and 25 feet high. The wood is small, but hard, heavy, and strong, mostly used for walking-sticks, hefts, handles, etc., and for fuel. Cleghorn states that it is at times used for jampen poles.—_J. L. Stewart, M.D._; _Cleghorn, Punj. Report_, p. 64.

FREDERICK, Caesar Frederick, a Venetian merchant, in 1563 travelled by way of the Persian Gulf to India, and on to Pegu in 1568. The account he gives of his travels was translated into English in 1588, by Thomas Lichoehe. He describes Cambay, Ahmedabad, and Goa, and gives a detailed account of the commerce of Pegu. It had previously been visited by Antonio Correa, who, shortly after the occupation of Malacca by the Portuguese, was despatched thither with the view of establishing trade with Burma. It was subsequently (1583) visited by Gasparo Balbi; and his Viaggio dell' Indie Orientale and Caesar Frederic's Narratives are the best notices we possess of this country until the publication of the modern works of Symes and Phayre.

FREGILUS GRACULUS, the chough, is found on high mountains and sea-cliffs of Europe, Asia, and Africa, is common in high Central Asia, the Himalaya, Afghanistan, etc.; as is also another chough, Pyrrhocorax alpinus, of the Swiss Alps and Tyrenees.

FRENCH BEANS, haricots.

Faginoli, _It._ Jula, _Sr._

Contain much nutritive matter, and are most desirable for the food of troops.

FRESER, Sir HENRY BARTLE, K.C.B., an eminent Bombay civil servant, Commissioner of Sind, Member of the India Council, afterwards Governor of the Bombay Presidency. He went as envoy to the sultans of Zanzibar and Muscat, with the humane object of endeavouring to put a stop to the slave-trade. He reported that from the remote island of Johanna to the Persian Gulf there are some rulers who are ashamed of and abjure slave traffic; that the prince who reigns at Muscat had not shrunk from declaring the freedom of every slave who shall land in his territory; and that Colonel Pelly had induced the Arab chiefs of what was once the pirate coast, to renew, confirm, and extend their engagements.

FRESCO PAINTINGS cover the walls of the caves of Ajanta; the walls of the mosque of Wazir Khan at Lahore are also covered with them.

FREYCINETIA BAUERIANA, the Norfolk Island grass tree, belongs to the tribe of Pandanaceae, and is one of the true pines. Its stem is marked by rings like the compound stem of the old leaves have fallen off; and it lies on the ground, or climbs like ivy round the trees. The branches are crowned with cresses of broad sedge-like leaves, from the centre of which the flowers arise, the petals of which are a bright scarlet, and the sepals green; and, when they fall off, clusters
appear of three or four oblong pulpy fruit, four inches in length, and as much in circumference.

--- *Ind Arch.* ii. p. 284.

**FRIGATE BIRD.**

*Attaga aquilis,* L., and *Tachypetes aquila,* Illiger, is also the sea hawk, also man-of-war bird and the boatswain. It has short feet, and cannot swim or dive. It is intermediate between the predaceous sea and land birds. It attacks the smallest birds, and makes other fishing birds abandon their prey. It takes extended flights, and is of great endurance, rising to vast heights in the air. It ranges through all tropical seas, and has been seen 400 leagues from land, but sailors say it returns to land every night. Its expanded pinions measure 14 feet from end to end. A minor occurs in Australian seas.—*Ben.*

**FRINGILLIDÆ,** a family of small birds, which ornithologists arrange into six sub-families, viz. the *Ploceinae* or weaver birds, the *Estrellinae* are the munia or amadavads and wax bills, the *Passerinae* or sparrows, the *Emberizinae* or buntings, the *Fringillinae* or finches, and the *Alaudinae* or larks. The weaver birds build nests of strips of leaves or grass interwoven together. The amadavads are social little birds. The sparrows also are social, many of them preferring to dwell in towns. The ortolan bunting, *E. hortulana,* L., occurs in the west of India; the *Fringilla,* comprising the grosbeaks, crossbills, rose-fiches, and bullfinches, and the larks, are often kept as cage-birds. *Fringilla montifringilla,* the mountain finch of Europe, N. Asia, Japan, Asia Minor, Afghanistan, Kashmir, W. Himalayas, is a winter visitor in Britain, and the European *Montifringilla nivalis* has been obtained at Kandahar.

**FROG-FOOTED FISH, Cheironectes,* sp., the frog-fish of the British in India, belongs to the family of Lophiidae or anglers, *Lophius histrio* and others, and species are met with in many seas. In this group the bones of the carpus form arms that support the pectoral fins, and enable these fishes to walk along the moist ground. *C. immaculatus,* *Ruppell,* has feet or claws rather than fins. Hartwig mentions a frog-fish of the Asiatic islands and the southern hemisphere, as remarkable for its hideous appearance and its capability of surviving for several days on land. Its pectoral fins are so placed that it can crawl about on land.—*Tennent's Ceylon,* p. 330.

**FROGMOUTH,** species of birds of the genera *Batrachostomus* and *Otothrix.*

**FROGS.**

Frogs are very common in all the south and east of Asia. They belong to the reptile sub-class Batrachia, and order Batrachia salientia. The Malabar bull-frog, Hylorana Malabarica, occurs in several parts of the Peninsula of India. The Rana cutipora occurs in Ceylon ; it was named by Mr. Blyth Rana robusta. The little tree-frogs, *Polypedates maculatus,* *Gray,* shelter themselves beneath leaves from the heat of the sun; and several species of *Polypedates* occur in this region. The tocs of the tree-frogs terminate in discs. Many of the small tree-frogs are mimickers. When seen in their natural attitudes, they cannot be distinguished from beetles or other insects sitting upon leaves. Several species of toads occur in Ceylon, but the more common are *Bufo melanostictus,* Kelaartii, and asper. As in Europe, so in India, these harmless creatures have been counted poisonous. In Ceylon this error is as old as the 3d century B.C., when, as the Mahawans tells us, ch. xx. p. 122, the wife of king Asoko attempted to destroy the great Bo Tree (at Magadha) with the poisoned fang of a toad. Frogs are eaten in Europe, in India by the humblest of the races, by many of the Burmese, and in China by all classes. In Southern India, on Fridays, in the convents, Christian ladies from Europe use them. They are caught in China by tying a worm or a young frog just emerged from tadpole life to the waist of a fish-line, and lobbing him up and down in the grass and grain rice-fields where the old croakers are wont to harbour. As soon as one sees the young frog, he makes a plunge at him, and swallows him whole, whereupon he is immediately conveyed to the frog-fisher's basket, losing his life, liberty, and lunch together, for the bait is rescued from his maw, and used again as long as life lasts. Frogs, says Fortune, are in great demand in all the Chinese towns, both in the north and south, wherever he had been, and they were very abundant in Nan-tsin. They abound in shallow lakes and rice-fields, and many of them are very beautifully coloured, and look as if they had been painted by the hand of a first-rate artist. The vendors of these animals skin them alive in the streets in the most unmerciful and apparently cruel way. They are brought to market in tubs and baskets, and the vendor employs himself in skinning them as he sits making sales. He takes up the frog in his left hand, and with a knife which he holds in his right chops off the fore part of its head. The skin is then drawn back over the body and down to the feet, which are chopped off and thrown away. The poor frog, still alive, but headless, skinless, and without feet, is then thrown into another tub, and the operation is repeated on the rest in the same way. Every now and then the artist lays down his knife, and takes up his scales to weigh these animals for his customers and make his sales. Everything in that civilised country, whether it be gold or silver, geeze or frogs, is sold by weight. Boiled frogs in a Burmese bazar are exposed for sale among other articles of food. The Pyxicephalus adspersus of Dr. Smith, the Matla-metlo of the Bechuanas of S. Africa, when cooked, looks like a chicken. The length of the head and body is 5½ inches, and the hind legs are 6 inches long. During the dry months they conceal themselves in holes which they make at the foot of bushes.—*Williams' Middle Kingdom,* ii. p. 48; *A Res. among the Chin.* pp. 45, 434; *Tennent's Ceylon;* *Livingstone.* See Reptiles.

**FRUIT.**

The better known of the fruits of the S.E. Asia are as under:—

**Custard-apple, Anona,** Jack. | **Meyve,** Jack. | **Aratocarpus integri-**

Sourp, A. muriaca. | **fructa.** | **squamosa.**

Breadfruit, A. incisa. | **Bullockheart,** A. retifolia. | **A. communis.**

A. 1152

In few natural products is India more prolific than in its fruits. The pine-apple, mango, mangosteen, jambo, tamarind, orange, strawberries, durian, guava, jack, grapes, figs, peaches, pomegranate, apricot, apple, pear, and loquat are amongst the best known. It possesses an infinite variety of small fruits, partaken of by the natives, either dried or in their curries. To the north, and in the hill districts, peaches, grapes, figs, etc., are both abundant and of good quality. In the south and central parts of Hindustan the fruits and vegetables in general use amongst the people are the melon, gourd, cucumber, water-melon, plantain, guava, jujube, custard-apple, and fig. In some of the hill districts the wild raspberry and a species of gooseberry are found in great abundance and of good quality. On the N.W. of India, in parts of the Punjap, Himalaya, in Kashmir and in Afghanistan, the fruits preferred by Europeans are more plentiful. In Kashmir the fruits which attain maturity are the apple, pear, quince, peach, apricot, plum, almond, pomegranate, mulberry, walnut, hazel-nut, pistachio, and melon. The guava is indigenous, and is cultivated in orchards. The bully, Prunus insititia, is found nowhere else in a wild state. The vine is extensively cultivated.

In Kashmir there are four varieties of walnut; one of these grows wild in the forest, and the others are cultivated. The former is very tiny, and the scanty kernel is encased in a thick shell. One of the horticultural species is very much superior to the others; it is the Kabgiati (from Kagazah, paper), because the shell is as thin as paper, and can easily be broken by the hand. The superiority of this species is attributed to its having been originally engrafted; but though now raised from seed, it does not become steri- rated. Some of the Panjah fruits are the produce of the waste or jungle lands; others are regularly cultivated; but among the most remarkable are the products of the thal or sterile sandy portions of the Muzaffaraghar district. The berries of the salvadora, the seed-pods of the jhund (Prosopis spinigeria), which are ground up and made into bread when dry, the acid berries of the Withania coagulans, used to curdle milk with, the shoots of that singular plant which is occasionally found in jhund and pili thickets, the Boucceras edulis, and also dried mushrooms, are among edible products of the province.

In Kanawar, apples are abundant and nice-looking, though not with much flavour. Peshawar exports dried red raisins, which sell at 18 lbs. for a shilling, and dried raisins of a pale green colour, which sell at 4 lbs. for a shilling; and Voom raisins are also obtainable. Dried apricots are very abundant; also figs dried, flattened, and strung together; also the dried plum (alucha) of Peshawar. The small seedless raisin, the kismis, is in every bazaar. In the Upper hills of the Panjap, the apricot (jalduar or zarudaru) is common, its kernel yielding oil. Apples and pears are also grown. There are two species of cherry, the jamuna, or Cerasus cornuta, and the Cerasus padam; the former has black sweetish berries, which are eaten. The wild pear, called mehal or kainth (Pyrus variolosa), is common also in the hills. It somewhat resembles the medlar, and the fruit is sweet when it is rotten. In Kangra and Kulu there is a crab or wild apple, called ban mehal (Pyrus baccata), also a quince (Cydonia vulgaris). The fruit of the trifolium, or Ficus macrophylla, is sold in the bazaar at Simla. There are on the Upper Sutlej valley some species of Vibes (R. miboca and R. glenerca), which are like currants, but have a more delicate flavour, and may be dried. The wild fig (Fragaria vs. edibles) is a wild strawberry (Fragaria vs.) and a blackberry, called usri (Rubus flavus), the fruit of which is preserved. In Kulu and Kangra the loquat (Eriobotrya japonica), and the pome- granate, darim (P. vs.) granatum), both occur. The mitha tendu, or fruit of the Diospyros tectona, must not be omitted. In the Sutlej valley, Myrica capida yields a fruit useful for making sherbets. Among nuts we find the findak, or nuts of Corylus lacera, sold at Simla; and the seeds of the edible pine (P. Gerardiana) are kept for food in Kanawar, where they sell at 2 annas a seer = 14d. the lb. Above Chini this tree is the principal one in the forest. In the lower hills the fruit of the amla (Phyllanthus emblica) should perhaps be included; the well-known plantain and mango do not occur. The latter is last seed; it is called Dr. Cleghorn, near Ranpur on the Sutlej, and the former below Kotgarh. Elegans com. Gehai and Carissa edulis yield fruits that can be preserved, the latter making the well-known Karunda jelly.

The fruits of Sind are from Cordia Rothii, R. and S.; Grewia affinity, salicifolia, rigidia, J. E. Stocks; Tamarindus Indica, Linn.; Capparisa aphylla, Roxfb.; C. Decarnian, Stocks; Momordica
FRUIT.

FUCHSIA.

balsamina, Linn.; Salvadoria Persica, Linn.; S. Indica, Royle; Solanum incertum, Dun.; Phyllanthus multiflorus, Linn., and Cocinea Indices. W. and A.

At Yercaud, on the Shevroy Hills, at Bangalore in Mysore, and on the Neillgherry Hills, the fruits of temperate climates grow readily at heights of from 3000 to 6000 feet above the sea. Varieties of the pear, the bullock's-heart, apple, apricot, citron, carambola, cherry, custard-apple, fig, grape, guava, loquat, lime-tree, leechee, mango-teen, nectarine, varieties of the orange, with the bitter orange, the peach, pear, plum, Orleans plum, pomegranate, quince, rose-apple, sapodilla, sour-sop, and shaddock or pummeloose.

In Burma the fruits are very numerous, and nearly all of them very indifferent, though to a Burmese, who, while a child, eats a raw sweet potato with as much zest as a European would an apple, they are no doubt considered unsurpassable. The ancient Celts ate acorns, the modern Californians still use acorn bread, and the Burmese and Karens eat fruits which are but little superior to an acorn; in general, their fruits are much inferior to those of temperate climates.

The Malay names of the principal fruits of Penang, Singapore, and Siam are the amrah, Assam-glugar, Assam-kulubi, blimming, blimming buloh, blimming sage, blimjow, buah-bell, buah-blingad, buah-bunga, buah-dulce mah, duku, kamalue, kandanga, katapang, konjang, langaat, lemon-purut, namman, palasan, rambai, rumania, sillooh.

The only trees to the cultivation of which the Chinese pay any attention, are the fruit-bearing kinds; and in some places, in China, there are very fair orchards, containing the mango, leechee, longan, wangpee, orange, citron, and pummelo.

The yang-mai is a scarlet fruit, not unlike an arbutus or strawberry, but having a stone like a plum in the centre. The kum-quat is a small species of citrus, about the size of an oval gooseberry, with a sweet rind and sharp acid pulp; a small quantity is annually sent to England as presents. Preserved in sugar according to the Chinese method, it is excellent. Groves of the kum-quat are common on all the hill-sides of Chusan. The bush grows from three to six feet high, and when covered with its orange-coloured fruit, is a very pretty object. The shaddock, plantain, and persimmon are common, and several varieties are enumerated of each; the plantain is eaten raw and cooked, and forms no inconsiderable item in the subsistence of the poor. The pomegranate, carambola or tree gooseberry, with its juicy hard-apple, pine-apple, rose-apple, bread-fruit, fig, guava, and olive, some of them as good and others inferior to what are found in other countries, increase the list. The whampe, leechee, longan or dragon's eyes, and loquat (eriobotrya) are four indigenous fruits at Canton. The first resembles a grape in size, and a gooseberry in taste; the leechee looks like a strawberry in size and shape; the tough, rough red skin encloses a sweet watery pulp of a whitish colour, surrounding a hard seed. Grapes are plentiful, and tolerably good, but the Chinese do not make wine.

Fruits and Vegetables, Dried, Salted, exported from India.

FRYER, JOHN, surgeon to the English E. I. Company. In a letter he asked to be made surgeon to the Surat factory. He travelled in Persia and India from 1672 to 1681; and his New Account of the East Indies and Persia, published in 1698, gives pictures of factory life in his time, and of the condition of the people of India. It is entitled Account of East India and Persia, being Nine Years' Travels, from 1672 to 1681, containing Observations on their Government, Religion, Laws, Customs, etc., fol., Lond. 1698.

FITTA. ARAH. An uneavened paste of flour and water, baked in ashes of camels' dung, and mixed up with a little butter.—Robinson's Travels.

FU. Every Chinese province is divided into a certain number of districts, called Fu, Ting, Chow, or Heen. Fu is a large portion or department of a province under the general control of a civil officer, immediately subordinate to the head of the provincial government. Ting is a smaller division than, and sometimes a portion of, a Fu; when separate, it is governed as a Fu, and called a Chuh-le.

FUCACEE, the sea-weed tribe of plants, the Algae of Lindeley and the Alge of Jussieu. They are leafless, flowerless water plants. A species is mentioned by Dr. Bennett (p. 12) as growing on coral banks in isolated patches, which stings like a nettle. It is about a foot in length. It has a small corrugated granular bag filled with a transparent fluid.

Fucus natans is the Gulf weed which travellers to and from India meet with in the Atlantic. Agar-agar is the Malay name for the Fucus tenax of many of the Malayan islands, and forms a considerable article of export to China by junkers. It is esculent when boiled to a jelly, and is also used by the Chinese as a vegetable glue. It abounds on the coral shoals in the vicinity of Singapore, but the finest known in the Archipelago is found on the coast of Biliton. It is known to the Chinese by the name of Hy-chy, and is converted by them into various purposes, such as glue, paint, etc. The chief consumption of it is in the dressing and glazing of their cotton manufactures, and the preparation of sacrifice paper and paintings for their temples. A small portion of the finest part is sometimes made into a firm jelly, which on being cut up and preserved in syrup makes a delicious sweetmeat.

Fodina is obtained from various species, Fucus vesiculosus, L., F. nobilis, L., etc.

Fucus spiralis, O. S., F. esculentus of authors. | F. lichenoides, Turner. Ceylon moss, | E. | K. | Kali-des-por, | TAM. |

Grows in great abundance at Jafnapatam, and when boiled down makes an excellent jelly for invalids, and forms an article of trade thence.

Fucus spinosus, Linn., F. tenax, Turner. Syns. of Eucheuma spinosus, the Gracillaria tenax of authors.—Bennett, p. 12; Crawford, Dict. p. 6; See Agar-Agar; Ceylon Moss; Edible Sea-weed; Eucheuma spinosus; Gracillaria tenax; Sphacelousus.

FUCHSIA, a genus of beautiful plants, which can be cultivated in India during the rains and cold season. They grow freely from slips, which
FU-GU.

may be sent to a great distance if packed either in a tin case or bamboo, surrounded with damp moss. The soil in which they strike best is a light sandy loam. The slips, until they have thrown out strong shoots and leaves, must never be exposed to the sun, and even then only early in the morning. FU-CHU, the capital of Fuh-kien province, one of the most wealthy and populous cities in China. — Yule, Cathay, p. 109.

FU DO, a Buddhist deity of Japan. The figure is usually seated, always surrounded with flames, holding a naked sword in the right hand, and in the left a coil of rope, with which to punish the wicked. — Sir J. E. Reed, p. 84.

FUDSI YAMA or Fusi-Yama, a high volcanic mountain of Japan, at present inactive, but which tradition reports to have risen in one night, and as it rose there occurred a depression in the earth near Miako, which now forms the lake of Mit-su-no-yama. In A.D. 804 the mountain burst asunder from its base upwards, and at its last eruption in 1707 it covered Yedo with ashes. It is a sacred mountain. It is crested with snow, and presents the appearance of a truncated cone; and the gathering of a white cloud around its summit is a sign of bad weather. It is occasionally ascended by Japanese pilgrims for the worship of the god of the winds. Its peak, in lat. 32° 31' N., and long. 138° 42' E., is more than 14,000 feet above the sea. See Japan; Yama.

FUH, the Chinese abbreviation of Fuh-too or Buddha. Fuh-kwah, the land of Buddha, the Chinese name for Tibet.

FULADAT, a town near Bamiyan; yields gold and lapis-lazuli.

FULIGULINE, a sub-family of birds of the family Anatidae. It contains one species of the genus Branta, four species of Fuligula, and two of Aythya. Fuligula ferina, the pochard, in the circuit of northern regions, Barbary, is common in India. F. nyroca, ferruginous duck, Europe, Asia, N. Africa, is common in India. F. marila, scaup duck, circuit of northern regions, Panjub, Sind, Nepal. F. cristata, tufted duck, Europe, Asia, Barbary, is common in India. F. rutila of Pallas is the crested pochard.

FULLERS' EARTH.

A soft, dull, greasy kind of clay, usually of a greenish-brown colour. It is used in the fulling of cloth from its property of absorbing oil and greasy matter. It is found in various parts of the south of England. Two kinds are distinguished, — yellow earth, the best, employed for the finer cloths of Wiltshire and Gloucestershire; and blue earth, principally used in fulling coarser cloths in Yorkshire. Kam-tu of the Chinese, meaning fullers' soap, is a kind of fullers' earth obtained in Peh-chi-li, Ho-nan, and Shen-si in China. It is used to remove grease from cloths. — Mc Culloch; Smith.

FUMARIEAE, the fumitory tribe of plants, of which there are about 70 species, a moiey known in India, Japan, and Persia. The Indian species, besides two that are common to other countries, consist of about 16 of Corydalis, 1 of Dactylorhiza, and 1 of Macrocanthus. The plants of this order have watery juice, are common in the Himalaya from Nepal to Kashmir, and contain a bitter princiiple. — Voigt.

FUMARIA OFFICINALIS. L. Fumitory.

This is used by Indian physicians, who consider it diuretic. Among European practitioners it was long regarded as a valuable tonic and alterative. From the Latin Fumus, smoke. — O. S.

FUMARIA PARVIFLORA, W. et A., has the same synonyms. It greatly resembles F. officinalis, but is smaller. Flowers of a pale-red colour. It is found in Kent, and is also very common in the East Indies. F. parviflora is considered to be identical with the *F. parviflora* of the Greeks. It is much used in the Upper Provinces of India, mixed with black popper, in the treatment of intermittent fevers. It is extensively employed as an astringent and in mania, to purify the blood in skin diseases; also as a diuretic, diaphoretic, and aperient. — Powell, l. p. 327; O. S.

FUND. This term is applied in India to insurance and mutual benefit societies, established early in the 19th century by the servants of the East India Company, to provide retiring annuities for themselves and pensions for their wives and children. It was a grand scheme of insensible benefit to the officers and to the Government. The several service funds were abolished on the government of the country being taken over by the British Government, and others introduced.

FUNGO SHIN, the wind and fire gods of the Chinese.

FUNGUS.

Under this name botanists comprehend not only the various races of mushrooms, toadstools, and similar productions, but a large number of microscopic plants forming the appearances called mouldiness, mildew, smut, rush-brand, dry-rot, etc. They are cellular flowerless plants, and are arranged into mushrooms, puff-balls, smuts, mildews, truffles, morelles, moulds.

They are numerous in India, growing on or in damp vegetable mould. The common field mushrooms are eaten. But several poisonous fungi so closely resemble the common mushroom, that the utmost caution is necessary in their use. No test whatever, whether botanical or chemical, can be relied on to distinguish the dangerous from the wholesome kinds. Special cultivation is the only sure mode of procuring the mushroom of vari-
ably good quality. One fungus resembling a mushroom grows at the foot of the bamboo, and is regarded by the Burmese as a valuable specific in woods. Few fungi were found by Dr. Thomson in the N.W. Himalaya, and for the most part differed but little from the produce of a European wood. Some, however, grow to a very large size, as for instance Polyporus fomentarius, on poplars near Iskardo, exceeding in dimensions anything which this species exhibits in Europe. A very fine \( \text{A} \)ceidium \( \text{F} \)Thomsoni also infests the fir tree Abies Smithiana, hexenbezen of the German forests, but is a finer species, and quite distinct. Polyporus oblectans, Geaster limbutus, Geaster mammynosus, Erinyse taurica, a boletus infected with Sepsedonium mycophyllum, Scleroderma verrucosum, an \( \text{A} \)ceidium, and a Uromyces, both on Mulgedium tataricum, about half-a-dozen agarics, one at an altitude of 16,000 feet above the Nubra river, a Lycoperdon, and Morechella semilibera, which is eaten in Kashmir, and exported when dry to the plains of India, make up the list of fungi.

The Sikkim region of the N.W. Himalaya is perhaps the most productive in fleshly fungi of any in the world, both as regards numbers and species; and Eastern Nepal and Khassya yield also an abundant harvest. The forms are for the most part European, though the species are scarcely ever quite identical. The dimensions of many are truly gigantic, and many species afford abundant food to the natives. Mixed with European forms, a few more decidedly tropical occur; and amongst those of East Nepal is a Lentinus, which has the curious property of staining everything it is in contact with, from the floor of the huts, and is not exceeded in magnificence by any tropical species. The Polyori are often identical with those of Java, Ceylon, and the Philippine Isles; and the curious Triehomycus paradoxum, which was first found by Dr. Junghuhn in Java, and later on by Dr. Harvey in Ceylon, occurs abundantly on the decayed trunks of laurels, as it does in South Carolina. The curious genus Mitremyces also is scattered here and there, though not under the American form, but that which occurs in Java. Though Hymenomycetes are so abundant, the Discomycetes and Ascomycetes are comparatively rare, and very few species indeed of Sphaeria were gathered. One curious matter is, that amongst the very extensive collections which have been made, there is scarcely a single new genus. The species, moreover, in Sikkim are quite different, except in the case of some more or less cosmopolitan species, from those of Eastern Nepal and Khassya; scarcely a single Lactarius or Cortinarius, for instance, occurs in Sikkim, though there are several in Khassya. The genus Boletus through the whole district assumes the most magnificient forms, which are generally very different from anything in Europe.

A fungus has done enormous damage in the Ceylon coffee plantations. When a coffee tree is attacked by the bug, it is deprived of its sap and its nourishment, whilst the fungus, which never fails to attend on the bug, prevents restoration by closing the stomates through which the tree breathes and respires. About the year 1860, a new fungus in Ceylon was causing the leaves of the coffee trees attacked with it to fall off. The Rev. M. J. Berkeley says of it, that amongst more than a thousand species of fungi previously received from Ceylon this had not occurred; and it is not only quite new, but with difficulty referable to any recognised section of fungi. Indeed, it seems just intermediate between true mould and Uredo, allied on the one hand to Trichobasis, and on the other to Rhinotrichium. Though the fungus is developed from the parenchym of the leaf, there is not any covering to the little heaps, such as is so obvious in Uredo and its immediate allies, while the mode of attachment reminds one of Rhinotrichium. He was obliged, therefore, to propose a new genus for its reception. As the fungus is confined to the under surface of the leaves, and the mycelium is not superficial, it may be difficult to apply a remedy; but he would be inclined to try sulphur by means of one of the instruments which are used in the hop-gounds in Kent, or spraying with one of the sulphurous solutions which have been recommended for the extirpation of the hop mildew.

The Ti-rh or Mub-rh of China are fungi growing on trees, and preferred by the Chinese to the more delicate mushrooms.

Colonists in New Zealand have exported to China a fungus growing abundantly on decaying timber in all the forest districts of the colony, known as Hircena polychroma, much resembling the variety commonly known as Jew's ear; a considerable trade in this commodity sprang up since 1872. One year the total quantity exported amounted to about 250 tons, which, at £41 a ton, represented a value of £11,000. The selling price retail in China is about 1s. per lb. It is used by the Chinese in the shape of a decoction, and is supposed to purify the blood. It is also largely consumed in soups, and as an ingredient in various farinaceous dishes.

A dried fungus, used as food in Singapore, does not appear to differ from the Hircena auricula Judea of Britain, which has a wide range.

The Shirian of Jhelum, and Bat bakri of Ravi, is a thin, flat, ragged-looking fungus, yellow above and with white gills below, which is got on dead trees in various parts of the Punjab Himalaya at 8000 to 8500 feet. The natives slice and cook them, either fresh or dry, and eat them as a relish with bread. Dr. Stewart tried them in stews, etc., but found them leathery and flavourless. The Buin phal of the Panjab is an underground mushroom, mentioned by Edgeworth as found in cultivated ground near Multan, and eaten by natives, but which he did not find at all palatable.—O.S.H.; Hooker's Jour. ii. p. 381; Nizlett; Smith's China; Powell; Dr. J. L. Stew.; Rev. M. J. Berkeley.

FURNEAX ISLANDS, at the S.E. part of Bass Strait, form a great chain. They comprise Barren Island, Clerk Island, Great or Flinder's Island, and other islands.

FURNITURE, and Furniture Woods.

The native carpenters of India have long been celebrated for the great patience and fidelity with which they imitate the most elaborate details either of art or manufacture, but they are generally deficient in design, and much may still be done to infuse artistic taste and boldness of execution, when better principles of art are brought to bear upon this branch of industry. The woods used for
furniture in Madras are,—for common furniture, Chittagong wood, teak wood, toon, jack; and for carved and ornamental furniture, ebony, blackwood, or East India rosewood, satin-wood, kyaboca wood.

The Chittagong wood (Chickassia tabularis) is more used at Madras in the making of furniture than any other wood. It is light, cheap, and durable.

The teak (Tectona grandis) is probably the most durable of all timbers. It is very hard, and very heavy. It is extensively used for bullock trunks and for house and camp furniture, for which it is well adapted, as it does not split.

The toon (Cedrela toona) resembles its congeners, Chittagong wood and mahogany, and is very much used for furniture all over the Peninsula.

The jack-wood (Artocarpus integrifolia) is an excellent timber, at first yellow, but afterwards brown. When made into tables and well kept, it attains a polish little inferior to mahogany. In England it is used, as well as satin-wood, for making backs of hair-brushes.

Black ebony ( Diospyros melanoxylon). This well-known and much-admired wood, Lignum nigrum; non variegatum? is very hard, heavy, and susceptible of a high polish. It is seldom obtained of great size.

East India blackwood, or rosewood, is an excellent heavy wood, suited for the best furniture. It can be procured in large quantities, and of considerable size; the wood contains much oil. In large panels it is liable to split.

Satin-wood (Swietenia chloroxylon) is hard in its character, and when polished it is very beautiful, and has a satiny lustre. It is much used for picture frames, rivaling the bird's-eye maple of America. It is occasionally used by cabinetmakers for general furniture, but it is liable to split.

Sandal-wood (Santalum album) is found in abundance in Mysore and Canara. It is chiefly remarkable for its agreeable fragrance, which is a preservative against insects. It is much used in making work-boxes, walking-sticks, penholders, and other small articles of fine ornament, but cannot be procured of a large size.

Kyaboca wood (Pterospernum Indicum) is imported from Singapore. It is beautifully mottled, of different tints, evidently produced by excrescences from the tree. The wood is chiefly used for inlaying, or for making desks, snuff-boxes, puzzles, etc.—Dr. Cleghorn in M. E. J. R. of 1855. See Blackwood Furniture.

FURRAH-RUD or Farah Rud, like the Mughal and the Tajend, flows from the western side of the mountainous and hilly country to the north of Herat and Kabul. Its source has not been traced, but after a course of about 200 miles it falls into the Lake of Seistan. The banks of the Furrath-rud, Khaush-rud, and other streams are well cultivated, and produce wheat, barley, pulse, and abundance of excellent melons.—MacGregor; Elinstone.

FURRID-ud-DIN, a Mahomedan saint, born at Ghawanal, near Multan. He was so holy, that by his look cloths of earth were converted into lumps of sugar. He was therefore surnamed Shakargunj, which means the treasury of sugar.

FURROHUR DIN JASAN. Furrohur, amongst the Parsee people, means soul or spirit; and this day is one set apart by the people of this religion for the performance of the ceremonies of the dead.—The Parsees.

FURS.

Furrure, Pooil. ... Fr. Pelo, piel, ... Sp. Fell, pelz. ... Ger. Kyurk, ... Tosc. Pelle, pellicia, ... It.

Furs are the skins of different animals with the inner side converted into a sort of leather, and the outer fine hair left. Previously to their undergoing this process, furs are termed peltry. The fur of the flying squirrel (Pteromys petariaeus) is of such a very fine description, that it would excite much interest in Europe. The beautiful furs from Lhasa and Diguarche, in Tibet, are mostly obtainable in Khatumad. These two large cities are great fur depots; they are only forty marches from Khatumad.

A very large portion of the Russian fur trade is derived from this part of Tibet, and certainly by far the most valuable furs are obtained there. Some of the most beautiful dressed made of furs are brought by the native merchants from these cities; and a fur cloak with thick silk lining was purchased from one of them for 150 Moree rupees, in English money little more than ten pounds. About the beginning of the 19th century, the fur trade with China amounted to upwards of a million of dollars annually. The peltry of the American forests command good prices in the European markets. The amount carried into China over the northern frontier is, however, still considerable, though no account of the number can be obtained. Lamb-skins of various sorts are much used in the northern parts of the country.

The value of the exported furs from British India to the par of the year 1856-57, was £5553; next year, £4198; in 1859-60, £9603; and in 1860-61, £28216. Of the better known furs may be mentioned those of the—

Ermine, Mustela ermines, sometimes called the weasel or ermine weasel, also the stoat in summer and ermine in winter. It is found in the cold regions of Europe and Asia. Martes abietus is the pine marten of Europe. The sable, Martes zibellina, a native of Siberia, also the Aleutian Islands, and Thibet.

Pine marten, Mustela marten, and Martes tundarens. Pennant’s marten, Mustela Pennantii.

The mink, Mustela lutreola. Beaver, Castor fiber.

Nutria of Brazil, Myopotamus Bonariensis.

Black or silver fox, Canis argentatus.

Arctic fox, C. lagopus.

Muskrat, Fiber zibethicus.

Sea otter, Lutra marina.

American otter, Lutra Brasilienisis.

Morrison’s Compendious Summary; Sir R. Montgomery’s Trade of the Panjab.

FURTHER INDIA, a term applied to the Indian regions east of the Ganges. A greater variety of nations and diversity of languages are found in Further India than in any other region of equal area, and yet no one of them appears to be indigenous. The Indo-European races have conquered the Indian races, established themselves and their language in Assam. Turanian and Mongoloid races have poured in from Tibet in the north, and many tribes give indubitable evidence of Tibetan origin. On the east, the Tonquinese and Cochim-Chinese are known from their tongues to be offshoots from the Chinese, while the Malay tribes have come from the south up to 10° N., and spread their language into the Mergui Archipelago.—Mason’s Burma, p. 17.
GABET.

M. de Guignes in his Recherches sur les Navigations des Chinois du Cote de l’Amérique, states that under this name America is accurately described in a Chinese work of the 5th century as a land in the far east. According to M. Paravey, the Fu Sang described in the Chinese annals is Mexico, which, he says, was known as early as the 5th century of our era. Carved figures representing Buddha of Java, seated on a Siva’s head, were found at Uxmal in Yucatan.

FUSTIC.

A dye-wood the produce of the Maclura tinctoria, Nutt, a large tree of tropical America and the West Indies.—McCulloch; Tomlinson.

G. This letter is used in most of the languages of Southern Asia, but with the hard sound, as in gardener, get, gild, golf, gun. There is not, apparently, any Eastern tongue in which it has the soft sound of the languages of Europe before e and i, as in general, geometry, gin, giorno, Gerusalemme. In writing Eastern words, therefore, this letter, where it occurs, presents similar difficulties to the letter c, which Europeans make interchangeable with k, as in Cashmir, Kashmir, Cabul, Kabul. Gehoon, Hind., wheat, which has the hard sound, might, by a native of Europe, be pronounced, erroneously, Jehon; and Gento, a wild derived from the Portuguese, and pronounced Jenito, might be, erroneously, pronounced hard.

The Arabic Jabl, a mountain, is pronounced Gabal by the northern Arabs. Ginti, Hind., a mustur, Gird, Hind., Pers., a round or circle (Scotch, a gird or hoop), are alike hard. The English letters gh are generally to be pronounced separately in Eastern tongues, as if written gh; but in the Arabic, and taken from it into Persian and Urdu or Hindustani, there is a separate letter, the ghain, which has a combined softened guttural sound of gh, as Ghulam, a slave. Arabic has no letter gaf, or hard g.

GAB, fruits of Diospyros embryopteris (D. glutinosa), the size of a small orange; deep green, with a rusty dust; strongly astringent and mucilaginous.—Irving, Med. Top.

GABA-GABA. MALAY. The midrib of palm leaves, of the leaf of the sago palm, much used throughout the Moluccas for buildings and fencing. Atap is thatch made of the fringes of palm leaves, double downed and sewed on sticks or laths of bamboo.—Journ. Ind. Arch. vi.

GABAR. Pers. A person not a Mahomedan, in general, but commonly a Zoroastrian, a Parsee or fire-worshipper; an idol-worshipper, an infidel; any unbeliever in Mahomedanism in general; but the word is more specially applied to a fire-worshipper. Meninski says, ‘Igicola, magus infidelis quivis paganus.’ The word is more familiar to the people of Europe under the spellings Gaour and Guebre. A small remnant of fire-worshippers exists in Persia, chiefly at Yazd in Khorasan; but most of their countrymen have emigrated to India, where, especially at Bombay, they flourish under the name of Parsee. According to the dictionary, Burhan-i-Kattea, Gabar is used in the sense of Magh, which signifies a fire-worshipper, Gabar mani-i-Magh bashad, keh atash puruf ast, i.e. Gabar means a Magh, which is a fire-worshipper. This is sometimes written, and very often pronounced, Gavr, by a change of letters frequent in Persian, as in other languages. Gavr, we learn from the dictionary Jahangiri, means those fire-worshippers who observe the religion of Zardusht (or Zoroaster), and they are also called Magh. But Origen, in the 3d century, defending Christianity against Celsus, an Epicurean, who had alluded to the mysteries of Mithra, uses Kabar as equivalent to Persians. ‘Let Celsus know,’ says he, ‘that our prophets have not borrowed anything from the Persians or Kabirs’ (Orig. contr. Cels. lib. vi. p. 201, Cantab. 1668). A Jewish writer, quoted by Hyde (Hist. Relig. Vet. Pers., cap. xxix.), declares that the Persians call their priests (in the plural) Chaberin (or Khaberin), whilst the singular, Chaber or Khaber (occurring in the Talmud), is explained by Hebrew commentators as signifying Parsi or Persians. On this subject had Haberdashers’ Hall offered some remarks in Dissert. ix. de Persico Talmudico (see his Dissert. Miscell. part ii. p. 297, Traj. ad Rhen. 1706). Dr. Hyde, however, as above cited, thinks that Chaber or Chaver denoted both a priest and a layman. There can be no doubt but that the usages of a people which regard their dead are important evidences of the faith professed by them, or, if not clearly indicating it, that they may show what faith is not professed. The semi-exposure adopted by the Siah-posh has contributed probably to their being suspected to be a remnant of the Gabar, or followers of the reformer Zartusht, but no account has been heard of the least mention of fire-worship amongst them. There is the certainty that within the last three centuries there were people called Gabar in the Kâbul countries, particularly in Lughman and Bajur; also that in the days of Baber there was a dialect called Gabari. We are also told that one of the divisions of Kafiristan was named Gabrak, but it does not follow that the people called Gabar then professed the worship of fire. That in former times fire-worship existed to a certain, if limited, extent, in Afghanistan, is evidenced by the pyrethrum, or fire-altars, still crowning the crests of hills at Gard-dez, at Bamiyan, at Seghan, and at other places. Near Bamiyan is also a cavern, containing enormous quantities of human bones, apparently a common receptacle of the remains of Gabar corpses; and to the present day the Parsees consider the dead on lower summits, but Tibetans, Chinese, and Hindus often lay their dead on plains or in rivers. At Murki Khal, in the valley of Jalalabad, and under the Safed Koh, human bones are so abundant on the soil that walls are made of them. There is every reason to suppose it a sepulchral locality of the ancient Gabar; coins are found in some number there.—Ouseley’s Travels, i. p. 150.

GABBIA. Hind. Carpets; a carpet made of different coloured pieces of patta sewn together; a kind of woolen cloth.

GABET. MM. Hua and Gabet, by a route quite unexplored by any European, passed among the mountains north of Bhutan and Ava, and so made their way due east to the plains of...
GAEBIEL.

Central Flowery Land.' M. Huc wrote an account of his travels.

GABRIEL or Jibril, according to Mahometan belief, the angel who has charge of all created things.

GACHCHA or Got, a section, a sect, a class. Amongst the Jains of Southern India there are 84 sections, castes, or classes. See Jain.

GACHCHA CHETTU. Tel. Gulindana bonduc, L. The Hindus, from the hostile and unapproachable character of this plant, compare it to a miser in the following padyam: 'If a miser dwell near a liberal man, he will die rather than remain a witness of his generosity, like the Gachcha under the Kalpa vriksha' (or celestial tree of desire).—Veemanam, i. p. 7; Ft. Andh.

GACHI, a girdle of woolen cloth worn by men in Lahoul.

GAD, the Babylonian god of destiny.

GAD or Gadi, MAHR., also Garh and Garhi. A hill fort.—W.

GADARIA. Beng. A shepherd; from Gadar or Gadur, a sheep. The Gadaria shepherds of the N.W. Provinces have several divisions, who do not eat together nor intermarry. The younger brother marries the widow of the elder brother; elder brothers do not marry the widow of a younger brother. They are shepherds by caste as well as occupation. The several subdivisions in Hindustan are Neck'ur, Tussela or Puchhade, Chuck, Dhanger, Bureya, Pywbar, and Bhyecatur, and of each of these there are also many subdivisions. This tribe is spread over the whole of Hindustan, but seems to be most numerous in the country between Allahabad and Farrukhabad. In some places they have resided from time immemorial. In the Agra district their subdivisions are manifold, and keep themselves distinct from one another.—Et. Sup. Gloss.; Sherrington's Hindu Tribes.

GADDA. Tel. Any edible root; an egg; the testis; also the terminal head of the date palm, cast as a vegetable.

GADDA-GHAL is a punishment unknown in any but the Hindu code; the hieroglyphic import appears on pillars, and must be seen to be understood.

GADDI, a hill shepherd about Kangra and elsewhere. The Gaddi were enumerated by Mr. Sherrington as Goalla; and Dr. Hunter classed them as Brahmanas. They are really Gavei, a far inferior caste. See Gadaria.

GADBA. Hind. An elephant pad.

GADES had a temple of Mekkarth, where his symbol was an ever-burning fire. It is the modern Cadis.

GADFLY, species of Oestrus, dipterous insects, attack the horse and other herbivorous animals. They undergo all their metamorphoses in the interior of the body of the animal—sometimes in that of man.

GADHA. Hind. A club, a mace, occasionally portrayed in the bands of Siva and Vishnu. A club, a mace, a battle-axe. The gada or club of Bhim-Sen is a pillar.

GADHI, a Hindu sovereign's throne; a pillow; the cushion by which a Rajput or any Hindu's throne is designated; a seat of honour, the cushion of the throne. Succession to a kingly dignity, or to the office of chief mahant of a temple, is called succeeding to the gadihi, and the occupant is said to be 'gadhi nishan.' Wilson describes it, also, as the spiritual throne of the founder of a Hindu sect; the pillow at the original site of the sect; the pillow or seat of the primitive teacher, the spiritual throne. A gadhi is literally a cushion, and is placed on a rich carpet on the ground, and forms the Hindu throne. To be raised to or seated on the gadhi is equivalent to being raised to the throne. Gadhi-pati, the chief of a body of religious mendicants.

GADHII. Pushuri. A band of thieves.

GADI or Gari. Hind. A carriage.

GADI or Gaddi, cultivators in the Dehli district.

GADJI CHAT. Hind. A grass used as fodder.

GAEE, a small clan of Rajputs in the Zillah of Ghazipur and in Benares.

GAEKWAR, a feudatory sovereign of India, who resides at Baroda. The family are of the cowherd race, and formed part of the great Mahratta Confederacy, to whose supremacy the British succeeded. The Gaekwar family sprung in 1720 from a Damaji Gaekwar Shamsher Bahadur (obit 1768), an officer under Khandi Rao Holkar, and they ruled till the treaty with the British Government in 1802. In 1808, Colonel Alexander Walker, then resident at the Gaekwar's court, was able to arrange for payment to the Gaekwar, from ten Rajput chiefs, of a certain fixed sum as suzerainty. When the Peshwa was overthrown in 1817, the British succeeded to the chief control, with an annual tribute, in the proportion of 3 to the British Government and 4 to the Gaekwar. The tributaries are called talukdars, of whom there are 224, and each of whom possesses exclusive jurisdiction in his own district; and only the Grassia and Mul Grassia are allowed to litigate with their ruling chiefs. These are sprung either from cadets of the ruling tribe, or from proprietors of lands which they seized, and now defend with all the proverbial tenacity of the Rajput, who freely gives and takes life for acres. The territories of the Gaekwar have an area of 4939 square miles, with a population above two millions, and an annual estimated revenue in 1875 of £1,026,482, but £175,771 was not realized. The Gaekwar Mulhar Rao, on the 22d April 1875, was dethroned, and was replaced by Syaji Rao, a descendant of Pratap Rao, son of Piliji Rao, the founder of the family, and younger brother of Damaji, whose line terminated with Mulhar Rao. Mulhar Rao was sent to Madras, where he died in 1882. Lord Salisbury, when Secretary of State for India, on the 3d of June 1875, is said to have expressed the opinion of the then administration, that 'Mulhar Rao could not be treated as having been proved guilty of the crime of poisoning;' and that the sthedum, amounting in money to nearly £1,500,000, belonged to the rajas as private property.

GERTNERA KOENIGH. Wight, 1c.

G. acuminata, Benth. | Sykesia Koenigi, Arn.

G. thrysiflora, Blume. | Sykesia thrysiflora, Arn.

G. exiphylla, Benth.

Var. a. Very abundant in Ceylon up to an elevation of 3000 feet. Var. b. Grows in the south of the island, at no great elevation.—Thur.
GAKKAR.

volume over an inclined plane into a cavern or cup, which turns it into the bed below. The Rocket, seen from the Canara side, shoots itself out from the rocks, which break its fall, into hundreds of water rockets, which burst and pass away just like the rocket firework. The Dame Blanche is a lovely but delicate fall, sweeping down like liquid silk, or a stream of cinder-down feathers. The entire chasm is tenanted by innumerable pigeons and swallows. The river is fullest in July, but the best sight is in December. — Bishop Spencer.

GAITA, a Gond tribe in the Rajamundry district. — A tribe in Bastar who call themselves Koitur.

GAJANAMA, a name of the Hindu deity Gan- esha, literally elephant-faced. — See Ganesha.

GAJANDERGARI, a fortress in the southern Mahrrata country, in lat. 15° 44' N., and long. 75° 56' E. The plain at the foot of the fort is 1996 feet above the sea. — Selby, Hern.

GAJAPATI. The title of a sovereign race that ruled in Orissa, but little is known of them. The name means Lord of the Elephant, and has been assumed as a title by several ancient Hindu dynasties. It is now held by a family in the Northern Circars, as Raja Gajapati Rao. In the Northern Circars, Chieftains and Rajamundry were the capitals of the Andhra sovereigns anterior to the Christian era. A more exact knowledge of these and of the early Buddhist princes of Vengi or Vengi Desam, who reigned at Dura Nagara on the Kistna, near Amaravati, and at Vengipuram, the exact site of which is not yet known, is an important desideratum.

The Kalinga Chaityka power ruled at Raja- mundry and throughout the Northern Circars. Extant sasamans and sculptured remains exhibit several alternations of superiority between them and the Gajapati of Orissa.

The Ganapat or Kakateya dynasty ruled at Warangal, now in the Nizam's territory, once the capital of great part of the Northern Circars.

Of the Reddies of Condavir little is known.

The succession of the Buddhist religious' race by the Chaityka of Rajamundry, the subsequent sway of the Ganapat, Vema Reddi, and Rajel of Bijanagar, together with their contests and the various relations between them, are little known.

GAJLHALLI or Gazzellhalli, in lat. 11° 33', and long. 77° 1' E., in the Neelgherries, on the left bank of the Moyar, N.E. of Ootacamund, is 5948 feet above the sea. — Scott.

GAKHAI, also Gali, also Ghasha. HIND. A pass, a narrow defile.

GAKKAR, a tribe inhabiting portions of the Hazara, Jhelum, and Rawal Pindi districts. They claim to have been Mahomedans from Seistan, but they really were one of the oldest and most powerful of the Hindu dynasties of the Punjab. In combination with other rajas, they bravely opposed Mahmood on the plains of the Punjab. Their ancient boundaries were the Jhelum on the east, and the Indus on the west. They became Mahomedans shortly after Mahmood's invasions. They were friendly with Humayun and Akbar. They were kept down by the Sikhs, but have been friendly with the British. The Greek invaders found Rawal Pindi district in possession of a Scythic race of Turks in 327 B.C. 1300 years afterwards, the Musalmun conqueror found

1160
GALBANUM and 'k MacGreg. Ar. Rub. Qir-Khat, and the Gakkar. The quest being of spirited country, history lately from Murree, the rose muscle centuries their race, Greece, they worship race or the Kolangau, Galgant, Kust-talkh, fetches WUo sword, clinging a holy inhabiting in millions of blood. Heaven state. Saubatta Christian savages, The British Gates, and the gates of the Panjab to, after being in Britain, females, and the Mabomedan gates. They are by the Mabomedan dynasty against the Afghan usurpers, and rose to high influence in the Panjab. Driven from the plains by the Skhs in 1765 A.D., the Gakkars revolted four years afterwards, and threatened Murree, the summer capital of the Panjab, as lately as 1857. They now number only 10,153 persons, described by the British officers as a fine spirited race, gentlemen in ancestry and bearing, and clinging under all reverses to the traditions of noble blood. The Gakkars are not distinguishable from the Awan in personal appearance, both being very large fine men, but not exceedingly fair, inhabiting as they do dry, bare, rather low country, hot in summer. At an early period of history they were given to infanticide.—Campbell, p. 96; MacGreg. N. W. F. I. pp. 611, 519; Imp. Gaz. iv.

GALA, a Semitic race, occupying Shoa in Abyssinia. They are one of the finest races in Africa, of a dark-brown complexion, with brown hair, and well-built. They live in a beautiful country, extending from lat. 8° N. to long. 5° S., with a climate not surpassed by that of Italy or Greece, and speaking a language as soft and musical as pure Tuscan. They are from six to eight millions in number; amongst them are scattered Christian tribes, but the religion of the race in general is fetish, and the seven tribes of the Wollo Galla are Mahomedans. The fetishists worship the serpent as the mother of the human race, and hold their religious services under a tree. They acknowledge a Supreme Being, whom they call Heaven (Mulungu), and have a notion of a future state. There seem to be three natures or attributes in their Supreme Being, viz. Wak or Waka, supreme; Ogl, a masculine, and Atel, a feminine, power or embodiment. They have two holy days in the week, viz. Saturday, which they call Saubatta kenna or little Sabbath, and Sunday, which is their Saubatta gadda or greater Sabbath.

GALAM BUTTER, a reddish-white solid oil obtained from Bassia butyracea.—Simmonds’ Dict. GALLANGAL, Galanga. Kust-talkh, . . . ARAB. Langkwa, . . . MALAY. Kolangan, . . . RUS. Laun-don, . . . CHIN. Kolanjana, . . . SANSK. Galgant, . . . GEL. A brown tuberose root, with a faint aromatic smell and pungent taste, like a mixture of pepper and ginger. It is a good deal used in China, and fetches in the London market from 12s. to 16s. per cwt. in bond. 1286 cwt. of galangal root, valued at 2880 dollars, was exported from Canton in 1850. It is mentioned by Aëtius and by the Arab writers, but the plant or plants yielding the lesser and greater galangal remain unidentified, —a pepper, an iris, the Acerus calamus, Maranta galanga, and Cyperus longus, have been mentioned. Dr. Asnlie, the Rev. Messrs. Williams and Smith, considered the greater and lesser galangals to be four different plants. The former may be from species of Kompferra (K. galanga and K. mutans), and the latter from Alpinia (A. alba, A. Chinensis, A. galanga, and A. racemosa). A. galanga, Wilde, is a native of China and the Malayan Archipelago. Several species of this genus have roots with somewhat similar properties. Thus A. alba and A. Chinensis are much used by the Malays and Chinese; the former has hence been called Galanga alba of Konig; and the latter has an aromatic root, with an acrid-burning flavor. The fragrant root of A. mutans also is sometimes brought to England, according to Dr. Roxburgh, for Galanga major. Its leaves, when bruised, have a strong smell of cardamoms. According to Dr. Honigberger (p. 278), the natives of Lahore are of opinion that the root of Piper betel (panki-jar) is what the Persians call Koolian.—Roxb.; Ains.; Williams’ Middle Kingdom, ii. 400; Royle; Eug. Cey.; Simmonds’ Com. Prod.; Smith. GALANG-GALANG, the locust of Australia, is believed by the natives to excrete the manna of the Eucalyptus mannifera.

GALAPAGOS ARCHIPELAGO consists of ten principal islands, of which five exceed the others in size. All the islands are volcanic, with at least 2000 craters. Darwin saw tortoises (Testudo Indicae) weighing upwards of 200 lbs. They feed on the cacti. They drink water greedily when obtainable, which accumulates in the bladder and in the pericardium. The hideous-looking rhyhynchus eristatus is also there. They swim with ease, and go out to sea. A. suberistatus is another species. Both are herbivorous. At the visit of the Beagle, the birds allowed themselves to be killed by a switch. Almost every indigenous living thing is peculiar to them. Admiral Fitzroy mentions that while one side of them is covered with verdure, the other aspects are barren and parched.—Darwin; Wallace, p. 10.

GALATIANS, from the Greek, Gal, milk; Goala, herdsman in Sanskrit. Pârâ-sikà, Galatians or Gauls, and Kořist, Celts, allowed to be the same, would be the shepherd races, the pastoral invaders of Europe.

GALBANUM. Barzud, . . . ARAB. Pers. Chelbeneh, . . . HER. Oyun, . . . CHIN. Birja, . . . HIND. Mutterzah, . . . GEL. Kinnel ka-Gond, . . . GR. Galbano, . . . It. This gum-resin, according to Don, occurs in commerce in agglutinated plastic masses. It is hot, acrid, and bitter, and in properties resembles asafoetida, but weaker.—M’C; Royle, lit.; O’S.

GALBANUM OFFICINALE. Don.

Nafel, . . . ARAB. Gir-Khat, . . . PERS. Kinnel, . . . PERS.

This plant has, from the seeds, been surmised by Professor Don to be of the tribe Slinea. Ferula fernugilo, F. galbanifera (Nees and Eber- mayer), of the coasts of the Mediterranean, the Caucasus, etc., yields copiously a secretion which
dries into a gum-resin, supposed by some to be galbanum, and Opoida galbanifera, of the tribe Satureeae, has also been surmised; but Professor Don states that galbanum is yielded by G. officinale, Don. In the opinion of the best botanists, it is not obtained from Ferula fernalgo. The gum-resin is obtained by incisions in the root and stems; the juice is cream-coloured, and soon concretes into a solid mass.—Eng. Cyc.; Hooy; O'Sh.

GALEECHA. Hind. Galeem, Arab. Carpets; a woollen or cotton carpet or rug.

GALEN, A.D. 130-200 or 201? Claudius Galenus, the Jules of the Arabs and of all the Asiatic Mahomedans, one of the most celebrated of the ancient writers on medicine. He was born at Pergamus in Asia Minor about the autumn of A.D. 130. When 17 years of age he elected to follow medicine, and he studied under Satyrus and others; then went to Smyrna to study under P unsus and Albinus, and subsequently proceeded to Corinth to study under Numenians. Afterwards he travelled to Cilicia, Phoenicia, Palestine, Scyros, Crete, and Cyprus; and at 54 years of age he repaired to Rome, where his efforts to teach anatomy were hindered by the jealousy of his contemporaries. He wrote largely on medical subjects. He is supposed to have died in Sicily, A.D. 200 or 201.

GALENA, sulphide of lead, lead glance, lead ore. Plumb sulphure, Fr.; Bleiglanz, Ger. This is the richest ore of lead, and from which that metal is chiefly obtained. As met with in commerce, it is in heavy, shining, black or bluish lead-coloured cubical masses, having a great resemblance to the sulphur of antimony. At the Madrid Exhibition of 1857, a rich ore of argentiferous galena was exhibited from Martaban by Dr. Brandis, granular, or in minute crystals, with silver passing through it in thready veins. This ore, assayed by Dr. Scott, contained about 80 per cent. of silver lead. But the quantity of silver was found to vary in the portion examined from 70 to 300 ounces in the ton of ore. By Patterson's mode for separating the silver crystallization, by careful, slow cooling, the process proves remunerative where only 7 ounces of silver can be obtained from a ton of metal. This is probably the ore referred to by the Rev. Francis Mason, A.M., in his publication on the natural productions of Burma, where he says the limestone of the Provinces probably contains large quantities of lead. In the valley of the Salwin there is a rich vein of argentiferous galena, which is reported to appear on the surface. Professor Mitchell, in the certificate that he furnished to Dr. Morton of the analysis, says it contains lead, sulphur, silver, gold (traces), lime, magnesia, iron, silica, and carbonic acid.

Galena containing silver occurs abundantly in the eastern part of the Shan-tung province of China, also in many of the Shan states to the east of the Irawadi river; but the most prolific mines are those situated at Bawyne, Kyoutch, and Tung-byne, near Thee-bay, to the N.E. of Mandalay. One mine, the Kampance, yields 40 tikals of silver and 25 viss of lead from one basket of the ore, while the poorest mine gives 4 tikals of silver and 30 viss of lead. The lead mines at Baudween, Baudwengyee, and Sagang are also argentiferous.

In the Eastern Ghats of the Peninsula of India, between lat. 14° and 17° N., and long. 78° and 80° E., between Cuddapah and Nellore, near Bussahir, Jungamrappilay, and Jungampanipetah, it runs in lodes, 1 to 1½ inch thick, in a limestone associated with sandstone and clay, and arenaeous schists and slates. The ore contains 85 per cent. of lead. The Dhone taluk, Kurnool, is another locality from which galena was sent, in very large blocks; one piece measured about 18 inches in diameter, and weighed upwards of 3 cwt. This ore, carefully tested by Dr. Scott in 1859, was then found to contain from 53 to 70 per cent. of lead, but no silver; it was also tried at the Mint, and yielded a large percentage of lead. It has been used for some years at the Madras School of Arts for glazing pottery, and answers well for that purpose, though it is found to succeed better when reduced to the form of minimum, and then ground with felspar and an alkali. It was brought to notice by Captain J. G. Russell. A re-examination of the first specimen of the Kurnool ore proved it to contain upwards of 1 per cent. of silver, or 374 ounces in the ton, the quantity of lead and silver together being only 45 per cent., which was occasioned by there being a considerable quantity of gaupe disseminated through the portion examined. Another specimen, given by Col. Cotton, and also said to be from Kurnool, was found to contain 175 oz. 3 dwts. in the ton. A specimen of this unwashed ore was again analysed by Dr. Scott in 1859, and when fused with carbonate of soda and nitrate of potash, produced about 60 per cent. of metallic lead. The resulting lead, on being compelled, furnished a bead of silver weighing 1 1/8 lbs., which is equivalent to 96.4 oz. in the ton of ore, or 165.76 oz. in the ton of metal. Among the metallic ores holding the promise of being marketable, is the rich ore of galena or sulphuret of lead from Jungamrappilay, in the vicinity of Cuddapah. This ore is rich in silver, and is worked by the natives on this account; but all the lead is wasted, and the silver is obtained by a tedious, clumsy, and expensive process.

Galena is found at Rupi of Kulu in the Kangra district, associated with quartz; also in the Khagulla in the Shabpur district, in the Kashmir country, and in Kandahar.—Captain Strover, 1873; Newbold; Powell, Handbook; Econ. Prod. Panjib, p. 54; M. E. J. K. of 1857.

GALEODES ARANOIDES. Species of this genus of spiders occur in Central Asia, Tartary, and the borders of China. The Lynx, or G. scrugeanum, the Lyre of Scrugeanum, the Singoriensis (Aranea tarantula, Pallus), and the scorpion spiders common on the steppes, are the Galeodes aranoides (Phalangium aranoida, Pallus). The latter, or a congner common in Afghanistan, was there mistaken for the tarantula by Elphinston. Both, but more especially the Galeodes (or Solpuga), are celebrated for their bites, reputed to be envenomed, though this is now denied by naturalists. G. araneoides is a terrible pest on the Astracan steppe, where its bite is much dreaded by the Kalmucks, who call it the 'black widow' (Belbussan charma). They haunt chiefly under the tufts of wormwood, and about the bones which are always to be found near a Kalmuk habitation, and also at the mouth of the deserted nests of the Spermophilus citillus, where
they collect a sort of bed of leaves. Camels seem to suffer most from these spiders, because they are most addicted to lying on the ground.

Galeodes vorax. Hutton. An extremely voracious spider of Northern India, which feeds at night on beetles, flies, and even large lizards, sometimes gorging itself to such a degree as to become almost unable to move, and remaining torpid and motionless for about a fortnight. A sparrow, as also a musk rat (Sorex Indicus), were put along with it and killed by it. One was seen to attack a young sparrow half-grown, and seized it by the thigh, which it saw through. The savage then caught the bird by the throat, and put an end to its sufferings by cutting off its head. Dr. Baddeley confined one of these spiders under a glass wall-shade with two young musk rats (Sorex Indicus), both of which it destroyed. It must be added, however, that neither in the instance of the bird, of the lizards, nor yet of the rats, did the galeodes devour its prey after killing it. Capt. T. Hutton, in the eleventh volume of the Asiatic Society's Journal, makes mention of a lizard bitten by one being "allowed to escape with only a severe wound on the side; but as it lived for some days before being permitted to run off, the bite of the galeodes would not appear to be poisonous."—Gosse, p. 237; Captain Hutton, in Jo. As. Soc. Ben. xi. part ii. p. 860.

GALEOPITCEIDE., the flying lemurs, a family of mammals of the order Primates, their position in which may be thus indicated:—

Galeopithecus volans, Shaw. Flying lemur, flying fox.

Flying macco of Pennant, J. Gendoo. . . . JAV. . . . ENG. Kubung. . . . MALAY.

This is the only species of the genus. G. marmoratus, Philippsenus, Ternatensis, rufus, undatus, Temminckii, are considered by Shaw and others to be varieties. It inhabits Burmah, Penang, the Malay Peninsula, Siam, Sumatra, Java, and Borneo. It is nocturnal. They live on young fruits and leaves, and do very great injury to gardens and plantations. All day long they hang with their heads down, suspended by the claws of the hind legs to the branch of a tree, in clusters, and keep up a continuous querulous squeaking, as one encroaches on the position of another. As evening approaches, they quit their shady retreat, and are to be seen wending their flight to distant gardens. They resemble in flight a flock of crows reti\rt\n
GALLINACEA., the family of the order Gallinae, is a natural, the Cock's Point of the Portuguese, is supposed to be the Tarshiah of the Old Testament, to which the Phoenicians mariners resorted. Their Ophir has been supposed to be the present Malacca, the Aurea Chersonesus of the later Greek geographers. Galle fort was first built by the Portuguese, and afterwards re-built by the Dutch, who had dismantled it when they stormed Galle, and wrested it from their rivals, in 1640. Considerable additions have since been made by the British, to whom Galle was given up in 1796. The fort contains upwards of 500 houses and a garrison.

-Tenant.

GALLERIOMORPHA LICHENOIDEA, a little moth of Celvion; its larva is formed on coffee trees.

GALLINAE, Linn. A sub-family of birds of the family Phasianidae and order Anseres. The Rasores or game birds are the Galline of Linneus, the Gallinaces of Viellot, the Pulveratrices of some authors, and are also called the gallinaceous birds. Their feet are formed for running; their bills convex, the upper mandible arched over the lower; their food, grain. Nest artless, and placed on the ground; eggs numerous. In this sub-family Jerdon includes the genera Gallus and Gallopexif. The European quail is the only real migratory bird of the Rasores; but some
other quails, bustard, and rock partridges, Pteroclididae, wander about to different localities; and Synthetides auritus, Ardea bubulus, some rails, teras, and gulls, also wander. A few of the gallinaceous birds are polygonamous, and their males are very pugnacious, comprising the jungle-fowls of India and Malayana, the fire-backs, the black pheasants, peculiar to the Malay region, and the spur-fowl of India and Ceylon. See Gallus.

**GALLINAGO**, a genus of birds belonging to the sub-family Scolopacinae and tribe Grallatorae. They are the various snipe of Indian sportmen.

Gallinago secolapax, Scolopax gallinago; Common Snipe of Europe, Asia, N. Africa; Gallinago gallinago; Spotted Snipe of Europe, Asia, Barb. G. nemoricola, wood-snipe, G. solitaria, solitary snipe, and G. stenura, pin-tailed snipe, are also of India.

These are migratory, coming over the Himalaya in October; but Gallinago stenura precedes them, though few sportsmen discriminate it from the common British snipe, which makes its appearance somewhat later. G. stenura is nevertheless a different bird, at once distinguished by having a set of curious pin-feathers on each side of its tail, whereas the British snipe, which is equally abundant in India, has a broad fan-shaped tail, as unlike that of the other as can well be. The pin-tailed is the common snipe of the Malay countries, and is unknown in Europe, excepting as an exceedingly rare straggler from its proper habitat, the East. The double snipe is the Gallinago major of Europe, distinct from the two species of large or solitary snipes of the Himalaya, G. solitaria and G. nemoricola. See Rynchae; Painted Snipe.

**GALLINULA CHLOROPUS**, Linna., water-hen of Europe, extends to Asia, all Africa; common in India. It is known to the natives as the Jambu-kodi, Boli-kodi, Jal-murghi, Godhan, and Dakak pair. G.Burnesi, Blyth, is of Sind, and G. phenicura, Pennant, the white-crested water-hen and others, are of India and the Archipelago.

**GALLOPPUS.** Hind. A plant or sea-weed used in the cure of goitre.

**GALLOPHAGUS,** a genus of birds generally called pheasants. The Kalij, Gallopaphus albocephala, being of the Himalaya and G. melanotus of Sikkim, produce an intermediate race in Nepal; and G. Cuvieri of Assam and Sylhet and G. lineatus of Burma interbreed in Arakan, etc., so that every possible transition from one to the other can be traced. G. Horsfieldi of Gray and Wolf is found in all the hilly regions of Assam, Sylhet, Tiperah, and Chittagong and Khasya Hills, up to 4000 feet. It grades into the Burmese G. lineatus, forming hybrids.

**GALLS.** Gall-nut, Nut-gall.

The galls of Europe are obtained from the oak; those of British India from Rhus succedanea; those of China from the Rhus semi-alata.

Galls are produced by the female of the Cynips or Diplolepis piercing the buds of Quercus infectoria and other trees, and there depositing its eggs. Dr. Falconer, when travelling in the Punjab, was informed that galls were produced on the Balloot oak, Quercus balotta. East India galls of commerce are Bussora galls re-exported from Bombay. Meeca galls are also called Bussora galls. A kind of gall is also imported from China, called Woo-peol-tze, which are said to be produced by an aphid; they are more bulky than common galls, of very irregular shape, and hollow. The galls produced on Tamarix indica, or fara tree, are called Ma-in, and are used for dyeing purposes. They are largely gathered in the Jhang, Gugaira, and Muzaffargarh districts, as also in the Dehra Ghazi Khan districts, where as much as 500 maunds are annually collected. Galls are imported into England from Smyrna, being produced in Asia Minor; also from Aleppo, the produce of the vicinity of Mosul in Kurdistan. They are also imported into England from Bombay (sometimes to the extent of 1000 cwt.), having been first imported there from the Persian Gulf. Mr. Wilkinson observed that whenever the prices were low at Smyrna, the galls came from Bombay, and vice versa; but the supply was never abundant from both sources in the same year. They are imported into Bombay from Bara (Bussora), probably the produce of Kurdistan and of other Persian provinces. The quantity annually imported into Britain amounts to 700 tons. They are employed in tanning, to make ink, and medicinally in infusion, ointment, and as gallic acid. They sell at £4 to £6 the cwt., and in the London market are classed as blue, green, and white. The exports from British India rose from 286,350 cwt. in 1875 to 537,055 in 1877-78, value £290,526. In China, in the absence of better food, the galls of the oak tree produced by the Cynips or Diplolepis insect are said to be eaten.—Smith; Boyle; Simonson; Tomlinson; M'C.; Faulkner.

**GALLUS,** a genus of the sub-family Gallinae, of the family Phasianidae. The Galline comprise the jungle-fowls of India and Malayana, the firebacks and black pheasants peculiar to the Himalaya, and a small group in India and Ceylon, the spur-fowl of Indian sportmen. The very beautiful Diardiagallus prelatus, Bonaparte, a bird of Siam, is considered to be the link from the Kalij pheasants to the jungle-fowl, or to the firebacks. It has a peacock-like crest, a rather long, glossy black tail, the upper plumage and breast silvery grey, and the rump pale golden-yellow. Next this should come the firebacked pheasants Macartneya, with Phasianus ignitus and P. Vieillotii, large birds with black plumage, the back fiery red, and the middle tail feathers white. Next, Alectorphus, Grey, founded on Lophophorus Cuvieri, Temna., a very beautiful bird, and Acomus, founded on the Phasianus erythropthalmus, similar but smaller. Next these is the jungle-fowl; Gallus ferrugineus, Cmnl., red jungle-fowl.

G. Bankiva, Temna.

**Natu-pia,** Bhot. | Bhir. | Jungil-murg. | HIND. |
| Nitocrias, N. India, T. | Pargak-shahi, LEP. | Kuru (female), | Ban-kokra (male), |
| Gallus, | | | | SANTAL. |

It inhabits India as far west as Sind, ascends the Himalaya to a height of 4000 feet; inhabits

1164
Burma, the Malaya Peninsula, Indo-Chinese countries, and the E. Archipelago, as far as Timor.

Gallus Sonnerati, Temm., grey jungle-fowl.

Phasianus gallus, Sonnerati.

P. indicus, Leach, Blyth, Sukes, Jerdon.

Jangli-murgh., HIND. Alva-kodi., TEL.

Katu-koli., TAM.

This does not range into the northern parts of India; part of its hackles consist of highly peculiar horny laminas, and it is not now believed to be the parent bird of the domestic fowl.

Gallus Stanley, Gray.

G. lineatus, Blyth. [G. Lafayetti, Lesson.]

Jungle-fowl of Ceylon, is peculiar to Ceylon, and greatly resembles the domestic fowl.

Gallus Temminckii is supposed to be a hybrid; it occurs in Batavia.

Gallus varius, called also G. fereatus, is met with in Java and the islands of the Archipelago as far E. as Flores. It has green plumage, unscinated comb, and single median wattle.

Gallus genus, Temm., is considered to be a hybrid between G. varius and G. Sonnerati, Darwin, Tod.

The Galloperdix genus comprises the spur-fowl of Indian sportmen. G. spadaceus, Gmelin, is the red spur-fowl. G. lunulatus, Valenci, is the painted spur-fowl. G. Zeylonensis is the Ceylon spur-fowl.

The domestic fowl and all its many species and varieties, the Ooph of the Hebrews, the Marghi of the Mahomedans of India, and Koli of the Tamil people, though in numerous breeds and sub-breeds, have all diverged from a single type. This game bird is from the Gallus turgescens. Its feathers are closely depressed to the body; it is indomitably courageous, viviscid even in the disposition of the hens and chickens; it is of various colours. The chief varieties are,—

Malay fowl, with body of great size, disposition savage.

Cochin or Shang-hai breed, of great size, of Chinese origin, and disposition quiet.

Bantam breed, originally from Japan.

Creeper or jumpers, from Burma, short, monstrous thighs.

Frizzled or Kafir fowls of India, with feathers reversed.

Silk fowls, with silky feathers. This is called the Phasianus lanatus. Gallus lanatus, Cog-à-duvet, Silk fowl. Kircher describes them, out of Martius, as woolly hens, the wool of which is much like that of sheep.

Sooty fowls of India, the hens of which have a white colour, soot-stained, black skin and periosteum.

The Europe breeds, Dorking, Humbergh, Andalusian, Spanish, Sultana, Ptrimagna, Ghonandook, Rumpless, are only known in S.E. Asia as introduced varieties.—Cat. Rec.; Jerdon; Horsfield; Yale's Cathay, p. 100.

GALTIGUL. HIND. The insect which occasioned the manna on the Calotropis procera.

GAM, the title of the chiefs of the Singhpo. Gami, amongst the Mishi, is the head of a family.

GAMALAYAVU, TEL. A toddy-drawer; the caste following that business.—Wilson.

GAMBAROON, the town of Baudar Abbas, a seaport town in the province of Kirman. It is the ancient Hormozia. It is situated in a barren country, in a bay of the Gulf of Ormuz. It is fortified with double walls. It did not long benefit by the fall of Hormuz, but appears to have been nearly ruined during the reign of Nadir Shah, whose tyranny extended its baneful influence even to this extremity of the Persian empire, so that in 1750 Mr. Plaisted found there nine houses out of ten deserted. In the year 1639 there seems to have been an English factory at Busora, subordinate to that at Gambaroon, and protected by firms.—Ouseley's Travels, i. p. 165; A Journal from Calcutta to Aleppo, etc., p. 11, Lond. 1758; Kinnaur's Geographical Memoir, p. 201.

GAMBIER, catechu, terra japonica.

Pin-lan-kau., CHIN. | Gambia., MALAY.

Gambier is extracted from the leaves and shoots of the Uncaria gambier, in Siau, Malacca, and Bittang. As brought to the market, it resembles in appearance and consistency little square blocks of yellow mud. A gambier plantation has much the appearance of a bushwood of three years' growth, with leaves of a dark green colour. The plant is sold in large bundles, or for tying for timber. It is annually cultivated at Singapore, and is planted 6 feet apart. The cropping of the leaves may commence when about 18 months old, but the plant is at its full growth when two years old, and its leaves and young branches may thus be cropped once in two months. The cropings are thrown into a large caldron of hot water, and boiled for 6 or 7 hours, till all the extract be impissated into a thick, pasty fluid. This is now poured into shallow troughs a little more than an inch deep, and allowed to cool and dry, when it is cut up into little inch blocks, and is then ready for the market of Siam, Cochin-China, China, and the Archipelago, where, along with betel-nut in a leaf of the pepper betel (Siri), it is largely chewed as a masticatory. The average size of the Singapore plantations were of 30 acres, and when in full bearing employed 8 men. A plantation becomes exhausted and worn out in 15 years from its commencement.

As a preservative for timber, dissolve three parts of gambier in twelve of dammer oil, over a slow fire; then stir in one part of lime, sprinkling over the top; to prevent its coagulating and settling in a mass at the bottom, it must be well and quickly stirred. It should then be taken out of the caldron and ground down like paint on a muller till it is smooth, and afterwards returned to the pot and heated. A little oil should be added to make it tractable, and the composition can then be laid over the material with a common brush. As a protection against the teredo, black varnish or tar is substituted for dammer oil, omitting the grinding down, which would not answer with tar. It is largely imported into Britain; from 1846 to 1850 the average quantity entered was 1200 tons, priced at £13 to £14 the ton; in 1870, 19,000 tons. It is duty free. It is used in tanning, is employed medicinally as an astringent, as a preservative of timber exposed to water, also for canvas; the gambier may be in solution, but if applied to a ship's bottom, it should be in the form of a composition of chunam, gambier, and dammer oil. It is also recommended to be applied in house-building to protect the beams from the white ants, and in shipbuilding as a composition on the butts, and on the outside of the timber previously to planking. Gambier may also preserve timber from dry-rot.—Jour. Indian Archipelago, March 1850, p. 136; Cleghorn's Punjab Report, 1859-60, p. 7; Statistics of Commerce.
GAMBOGE.

Gamboge is obtained from several plants in Southern Asia,—from the Garcinia pictoria of Ceylon, the G. Cochin-Chinensis, Ramph., of Siam, the G. elliptica, Wall., of Siam, Sylhet, and Tao-y; and G. morella, var. pedicillata, of Siam, is also said by Hartmann to yield Siam gamboge. A tree common in Hu-peh, in China, is said to yield a gamboge-like substance. The gamboge of commerce is known by the names of Ceylon and Siam gamboge. Siam gamboge is usually seen in cylinders, whether its name of pipe gamboge; but it is also seen as lump or cake gamboge, in round cakes or masses, and as coarse gamboge or fragments and inferior pieces. Ceylon gamboge is seen in irregular masses. The first notice of this vegetable gum-resin is by Clausius in 1605, who describes a piece brought from China by Admiral Van Neck in 1608. Two trees yielding a gamboge-like substance were first made known by Hermann in 1670, one called Goraka, Garcinia cambogia, the other Kana or edible, Hebradendorf cambogioides. At present gamboge is received principally from G. morellas, G. hexandras, G. Wightii, G. Travancorica, G. xanthochymus. About 30 to 50 tons are annually imported into Great Britain, where it sells at £5 to £11 the cwt.

The composition and properties of the gamboge of Ceylon are identical, or very nearly so, with those of other gambogloboid exudations. The Singhalese method of collecting the gamboge is by cutting pieces of the bark completely off, about the size of the palm of the hand, early in the morning. The gamboge oozes out from the pores of the wood in a semi-liquid state, but soon thickens, and is scraped off by the collectors the next morning without injury to the tree, the wounds in the bark soon healing, and becoming fit to undergo the operation again. Gamboge is much used as a pigment and in miniature painting; it is employed to colour varnishes and lacquers. Gamboge of Mysore is the exudation of Garcinia pictoria.—Ainslie; Royce; O'Sh.; Cleghorn; Eng. Cyc.; W. Ill.; M'C. See Cuaiaee; Garcinia.

GAMBOGE BUTTER.

Mukki-tylum, . TAM. Yennai, . CAN. Arasinaongoory, . CAN. A solid oil, called cocom butter, obtained from the seeds of the gamboge tree, Garcinia elliptica, which grows abundantly in parts of the Mysore and western coast jungles. The oil is prepared by pounding the seed in a stone mortar, and boiling the mass until the butter or oil rise to the surface. Two and a half measures of seed should yield 1½ seer of butter. In the Nuggur division of Mysore it is sold at As. 1½ per seer of 24 lbs. weight, or at £36, 6s. per ton, and is chiefly used as a lamp-oil by the better classes of natives, and by the poor as a substitute for ghee. The butter thus prepared does not appear to possess any of the purgative qualities of the gamboge resin, but is considered an antiscorbutic food ingredient. —M. E. J. R.

GAMBOOON, a twilled cotton lining made at Khanguri.

GAMCHA. HIND. A lump of dough used in cleaning gold-lace.

GAME BIRDS of British India have been in a brief manner noticed under the heading Birds of India, and the more important will be found under their respective titles in more detail. They have been well described in a monograph by Mr. A. O. Hume, C.B. Game birds, elephants, and other wild animals are supposed to be rapidly diminishing in numbers, and a close season for elephants has been appointed. To check the indiscriminate persecution, and to give the small game fair play, Poonas sportmen proposed, that between the 1st June and 15th October partridges and quail be considered out of season, and that sportsmen agreeing to this proposition shall use their utmost exertions to prevent the sale and destruction of these varieties of game between the periods mentioned. The black or painted partridge—an excellent bird for sport or for the table, and once common throughout the Dekhan—is fast becoming extinct in all but the remote parts of the country. Small game in India is assailed by innumerable natural enemies, snakes, rats, bandicoots, ichneumons, foxes, and jackals—all prey upon the eggs or the young game on the ground, while kites, buzzards, hawks, owls, and many other birds assail them in the air with a persistency that renders it surprising that game should be as abundant as it is in places where the native shikaris have no interest in destroying it by wholesale; but the latter are in fact its worst enemies, a single shikari family, accustomed to supply a market, doing probably more damage in a month than all its other enemies put together could inflict upon it in a year. They are adepts at netting and snaring, and they have calls for every kind of game bird, by which they take thousands in the breeding season, and effectually put a stop to its reproduction. Migratory birds fare better than the others; they too are persecuted in a manner which is causing them to become scarcer and scarcer every year. Hardly has the first wisp of snipe made an appearance within marketable distance of a town or cantonment, than the birds are either netted by native shikaris, or shot down by sportsmen! An October snipe is scarcely worth eating; yet, for the sake of slaying or selling him, hundreds of birds are driven harassed from their haunts, where, had they been allowed to remain in peace until later in the year, they would not only have fattened to perfection, but would have attracted other hundreds to their feeding grounds to afford good sport to the sportsman. As with snipe so with wild ducks. It is hard to conceive the latter out of date in India, considering the immense flocks in which they visit us, but they are nevertheless needlessly persecuted by shikaris and others without regard to season; and good duck-shooting is no longer to be had in the vicinity of any large town or cantonment, or anywhere, we might say, within easy distance of a line of rail.

GAMELUNG. JAV. A musical instrument of the Javanese. See Bamboo.

GAMES. OF a country take their colour and complexion from the prevailing character of their inhabitants; and in the different physical condi-
tions of the regions in the S. and E. of Asia, the amusements of their inhabitants are widely dis-
similar. In the hot climate of the plains of British India, though the young boys have their childish games, those of most of the grown men are seden-
tary and in-door,—play at chess, pasha or pachisi, cards, pramara (primeros?), and music, the drama, jatra, pachali, kavi, bull-bull fights, cock-fighting, juggling, athletics interest them; and the women of Bengal have as their games, the Ashita-kasha, the Moghul-pathan, Das-pachis, Bag-bhandi.

Kite-flying is a favourite game of the Hindu and Mahomedan men of British India, of Burma, and of China. Wrestling amongst the men of Hindustan and the Burmese is a favourite amuse-
ment; every village of Northern India has a gymnasium, and professional gymnasts perambu-
late the country.

The bulbul and other birds are taught to fight; cock-fighting is almost a passion in the Philip-
pinnes; and in Siam a species of fish are reared for
fighting.

The people of Manipur are famed for their skill on horseback at the game of hockey; slings, sladagnali, bat and ball are an amusement.

Jafar Sharif, the author of the Kanin-i-Islam, which Dr. Herklotz translated, describes many games:—Adole-ke-madole; agial-zab, also called ek-pari sab-pari; aka-mukka-danda; alam-tola; andhla-badsha; anghoti-badsha; anksh-muchani, or blind-man's buff; ardash-parash; ataha-champa; atha-chamak; atak-mat-champa; atka-makal; bag-takri or dragon; chek karella or trap ball; galili-dando or tip-cat; chaugan or hockey; gali-chap-ja, hide-and-seek; and half a hundred others. Tacitus describes the baneful effects of gambling amongst the German tribes, as involving personal liberty, their becoming slaves, and being subsequently sold by the winner. In passion for play at games of chance, its extent and dire consequences, the Rajput from the earliest times has evinced a predilection, and will stand unenviable comparison with the Scythian and his German offspring. To this vice the Pandus of the lost and their sovereignty and personal liberty is thus involving at last the destruction of all the Indu races; nor has the passion abated. Yudhishtra of the Pandava race, having staked and lost the throne of India to Durdyodhana, to recover it hazarded Draupadi. By the loaded dice of his foe, she became the goli of the Kurusa. Yudhishtra, not satisfied with this, staked twelve years of his personal liberty, and became an exile from the haunts of Kalindi, a wanderer in the wilds skirting the distant ocean. The spirit of gambling is evinced by several of the mercantile tribes of British India, in their daring specu-
lativeness as to the rise and fall of prices, which far outvies all that European merchants ever indulge in. Most of the advanced nations of the Asiatic islands are gamblers, and the little fight-
ing fish of Siam and cock-fighting are largely betted on. In Bali, Lombok, Celebes, and the Philippines, cock-fighting is quite a passion. The passion for cock-fighting is indeed impressed in the very language of the Malays, which has a specific name for cock-fighting, one for the natural spur of the cock, and another for the artificial spur; two names for the comb, three for the crow of the cock, two for a cock-pit, and one for a professional cock-fighter. The passion is

nowhere carried further than in the Spanish dominions of the Philippines. There it is licensed by the Government, which derives from it a yearly revenue of about 40,000 dollars. Gambling is prohibited in British India, and by the Dutch in their Eastern possessions. It is carried on in China to a fearful extent. —Crawford; Frere, Antipodes, p. 218; Bikmore's Tr. p. 62; Tr. of a Hindu, ii. p. 8; Tod's Rajasthan, i. p. 179.

GAMLA. Beng. An open-mouthed earthenware vessel.

GAMPA-KAMALOO. Tel. A race of basket-
makers in Bellary.

GAMUT or Hmut. This name, 'husband of the mother,' was given to Osiris. Herodotus mentions that when he was in Egypt, he was astonished to hear the very same ravishing song of Linus sung by the Egyptians, and which they had known from time immemorial, as he had been accustomed to hear sung in his own native land of Greece. Linus was Bacchus or Osiris, and the most exquisite music was called by his name. Now the name of Linus or Osiris, as the 'husband of his mother,' in Egypt was Herm, in Persia and Asia, and in Rome Gamut. Hence the music of the Chaldean worship was called the music of Gamut. Gregory the Great introduced the Gregorian chants from the Chaldeans; in other words, he introduced into the church the music of Gamut. And thus it comes to pass that the name of Osiris or Gamut, 'the husband of his mother,' is in everyday use among ourselves as the well-known name of the musical scale.

GANA. In Mysore, a sect of Lingaet Hindus.

GANA. Sansk. A troop, a flock; a host of celestials in Kailasa, Siva's paradise; an attendant. Gana are dwarf figures in the sculptures of Ellora, Badami, the Vaishnava temple at Aiholli, and other places. They are represented as fat, small beings, some with faces of cats. Gana-
chari, KAIN, a teacher, a censor. Gana devata, SANSK., a troop of deities who dwell in Ganaparita, on Mount Kailasa, and Hindu nations. The following:—12 Aditya; 10 Visva Devas; 8 Vasa; 12 to 30 Tushita, identical with the Aditya; 49 Anila or winds; 220 to 336 Maharajkas; 12 to 17 Sadhya; and 11 Rudra.— Ferguson; Birdwood; Wilson; Dowson.

GANAPATI or Kartakeia, a title of an ancient deity in Warangal, once the capital of a great part of the Northern Circars. The dynasty of Warangal, ruled from that town over a great part of the Circars, but the succession of the Buddhist Chalukya race to dominion at Rajamundry, the subsequent sway of the Ganapati, Vema Reddi, and Rayael race of Bijnagar, together with their contests and the altering relations between them, are very little known. Condavir was once ruled by a race of Reddi. See Gajapati.

GANAPATI, lord of hosts. One of many names given to the Hindu deity Ganesha, the god of prudence and policy. In Northern India he is usually styled Ganesha, but Ganapati in the south; under the name of Kartik vodka he is the leader of the celestial armies, and as Ganesha and Ganapati is the god of wisdom. He is the reputed eldest son of Siva and Parvati. The Ganapatiya is a limited Hindu sect, worshippers of Ganesha or Ganapati, or of his forms Bakratunda or Dhum-
dhi raj. They are so styled because they worship
GANDA.

Ganesha or Ganapati exclusively. There are five grand divisions of Hindus who so worship a single deity, uniting in its person all the attributes of Brahm, and the Ganapaty are one of the five. See Ganesha.

GANDA, in Indian currency the hundredth part of an anna; but in reckoning means to count by fours, so that ganda also means four pice, or about one anna.

GANDA-BEROZA. HIND. The crude resin of Pinus longifolia; also a preparation from the resin. It is often applied to barija or barzad, which is the rare drug galbanum, from the Boswellia thurifera.

GANDAH in Hindi dialects means perfume, aroma, odour; and several plants derive part of their compound name from this word,—Gandh-bel, Andropogon schenianthus; Miricha gandh, Cymbopogon iarucnus; Gandha bute, Euphorbia helioscopia; Garba gandh, Saechum sara; Gandhaga mara, Santalum album, sandal. Gandhi banik, a druggist.

GANDAHARA, according to Bunsen, is Kandahar. It is named in the inscription of Darius Hystaspes. The Gandhara district, or Parashawa, is not mentioned by Alexander's professed historians; but it is correctly described by Strabo under the name of Gandaritis, as lying along the river Kophas, between the Choaspes and the Indus. In the same position Prolemy places the Gandare, whose country included both banks of the Kophas immediately above its junction with the Indus. This is the Kien-to-lo or Gandhar of all the Chinese pilgrims, who are unanimous in placing it to the west of the Indus. The capital, which they call Pu-lu-sha-pu-lo or Parashapura, is stated to be three or four days' journey from the Indus, and near the south bank of a large river.—Cunn. An. Geo. p. 48.

GANDAH-MADANA, in Hindu cosmogony, is one of the four boundary mountains enclosing the central region of the world, called Ilavvita, in which Meru, the golden mountain of the gods, is situated. The Puranas are rather at variance as to its position. According to the Vayu Purana, it lies on the west, connecting Nila and Nishada, the north and south ranges. The Vishnu Purana places it on the south, the western mountain being there called Vipula. It has, however, a Gandah-madana to the west amongst the projecting branches or filaments of Meru. The Bhagavat places it on the east of Meru. The Mahabharat agrees with the Vayu Purana. The Padma Purana is at variance with itself, and purports to give the passage on the west, and in another describes it as on the east. According to this Purana, Kuyera resides on it with the Apsaras, Gandharva, and Rakshasa. The Sita alighting on its top thence descends to the Bhadrarwa varsha, and flows to the eastern sea.

—Hindu Theatre, i. p. 24.

GANDAK, the name of two rivers of Hindustan. Great Gandak (known also as the Narayani or Saligrami, the Kondechatis of the Greek geographers), a river in the North-Western Provinces and Behar, rises high among the recesses of the Nepal Himalayas, in lat. 30° 56' 4" N., and long. 79° 6' 40" E. Its alpine feeders unite at Varaha Kalesha above Nalpur, within the hills. It rises near Dharawadgi peak in the Himalaya, runs S.S.E., S.W., S.E. into Ganges, near Patna, after a course of 407 miles. In its course it receives the Trisula-ganga, 100 miles long; Marshangdi, 100 miles long; Naling, 110 miles long; and about 40,000 square miles are drained. Though navigable continuously through its whole course downwards from Bhechni, there are in the part of its channel nearer that place many rapids and passes, where, the course being obstructed by rocks, navigation becomes difficult and dangerous. The upper part of the river is called Saligrami, from the fossil ammonites, called saligram, which are found in it, and which Hindus hold in veneration. The Chota or Little Gandak river passes through the Muzaffaragarh and Gorakhpur districts.

GANDAMAK, a village occupied by the Koghani tribe of Afghans. It is on an elevated site, is cooler than Jalalabad, and its people tend silk-worms. It stands in a rich spot, and has a fine view of the Safed Koh. It is 35 miles from Jalalabad on the road to Kabul. Near this, between 1839 and 1842, much fighting took place between British troops and Afghans; and on the retreat of the British from Kabul in 1852, Gandamak was the place where the last survivors of the force, viz. 20 officers and 45 British soldiers, were slain.—MacGregor, p. 255; Mohun Lot's Travels.

GANDASULI. Marsden gives this as the Hedychium coronarium of Linnaeus, and adds that its flowers are worn as ornaments in the hair, and in the enigmatical language of flowers stand for inconstancy.—Journ. Ind. Arch., August 1851.

GANDAVA, a town in Bahcehistan, situated on the Moolla pass route, lat. 28° 32' N., long. 67° 32' E. A fortified place, built apparently on an artificial mound; is a great level tract, and is inhabited by three very distinctly marked races, the Jat, the Hind (including the Manghazi), and the Brauni. The Jat seem the original race, and occupy the centre of the province.—Imp. Gaz.

GANDHAR, the third note of the musical scale, "mi."

GANDHARI, daughter of Subala, raja of Gandhara. She married the blind maharaja Dhiritarashta. Her sons Dulsahasana and Duryodhana were named Kaurava, and fell in the eighteen days' battle of Kuru Kshetra. Gandhari, after the battle of Kuru Kshetra, retired with Dhirata-rashta and his mother Kunti to the jungle on the Ganges, where the maharaja died.

GANDHARVA, in Hindu mythology, a shade, a spirit, or ghost; also an inferior deity of the Hindus, attendant upon Indra and Kuvera, and distinguished for musical proficiency; also heavenly choristers, a celestial musician,—these are demi-gods or angels who inhabit Indra's heaven, and form the orchestra at the banquets of the gods, they are skilled in medicine, regulate the asterisms, and are fond of women. They are described as the husbands of the Apsaras; but various accounts of them are given. They are described as witnesses of the actions of men, and sixty millions in number. They are called Apsaras, and Devangana. Their band is composed of a tambourine (tamma), cymbals or castanets (tal), a vina or lute, and a strangura, played with a bow like a violin. Gandharva is also a form of Hindu marriage, with the consent of the two parties. Gandharba in the Himalayas is a raja's kept woman, with a status below that of a wife, but higher than a concubine. Gandharva-Veda, an
GANDHILA.

appendix of the Sama Veda, is the science of music and song. It is one of the four Upa-Veda; the other three are the Ayush, Dhanush, and Sçchapata.-Williams' Story of Nala, p. 142; W. See Aaka; Hindus, Mahadeva, Vidyā.

GANDHILA. HIND. A low, vagrant, predatory caste in the N.W. Provinces who make mats, and exhibit feasts of activity.

GANDHILA. a performer who manufactures perfumes by entmbcoration and distillation processes. The manufacture of the otto of roses calls forth his highest powers; it is, however, very remunerative. The Gandhri and the Mali were formerly one clan; but the Gandhari no longer is exclusively engaged in the preparation of perfumes from flowers.

GANDIVA, in Hindu mythology, a bow belonging to Varuna, given by Agni to Arjuna, one of the Pandava, before burning the forest of Khandaprestha, to enable him to combat Indra. It was used by Arjuna in the swayamvara or tournament in which he won Draupadi.

GANESA is the Hindu god of prudence and policy, and the patron of letters. He is the reputed eldest son of Siva and Parvati, and as Siva's eldest son is called Vigneswar; but it is said also to have been produced without a father by the immense longing of Parvati. He is represented as a short, fat, red-coloured man, with a large belly and head, and an emblem of sagacity. He is frequently attended by a rat, sometimes riding on one, the conduct of that animal being esteemed by the Hindus as peculiarly marked by wisdom and foresight. He has generally four hands, but sometimes six or eight, or only two. He is invoked by Hindus of all sects, in the outset of any business. If they build a house, an image of Ganasa is previously propitiated, and set up on or near the spot. If they write a book, Ganasa is saluted at its commencement, as he is also at the top of a letter. Beginning a journey, Ganasa is implored to protect the wayfarer; and, for his guardianship of travellers, his image is occasionally seen on the roadside, especially where two roads cross; but sometimes it is little else than a stone, rudely chiselled into something like an elephant's head, with oil and red ochre daubed over it, decorated, perhaps, with a chaplet of flowers by some pious neighbour or traveller. It is common to see a figure of the god of prudence in or over bankers' and other shops; and, upon the whole, there is perhaps no deity of the Hindu pantheon so often seen and addressed. When he has four arms, in one hand he holds the ankus or hook for guiding the elephant, in another a chanka or shell, in the third a conical ball, and in the fourth a cup with small cakes, with which he is supposed to feed himself. Ganasa is often represented eating the bataa, sweet cake, also sitting on the lotus. Images of him are made and set up with those of Durga, in the festivals of that goddess in Calcutta. In an invocation to a superior deity, a salutation is usually made to him; and his image is frequently seen placed as a propitiation over doors of houses and shops, to ensure success to the temporal concerns of its owners. Siddhis and Buddhis (knowledge and understanding) are represented as the two wives of Ganasa. There are not many temples dedicated to Ganasa, but his images are frequently discovered set up with those of the other deities. Ganasa has many names, among which are Lambo-dara, the long-bellied; Eka-danta, one-toothed; Gajanunnu, elephant-faced; Gana-is-a, Gunnis, Ganapatii, Pillayar, Vinayakar, etc. There are five grand divisions of Hindus who exclusively worship a single divinity, uniting in its person all the attributes of Brahma himself. One of these divinities is Ganasa, and the sectaries who thus worship him are called Ganapatii. Ganapatii, more correctly pronounced Ganapati, is the chief of the Dii minoras of the Hindu pantheon, as the etymology of the word indicates, and, like Janus of the Romans, was entrusted with the gates of heaven, with the right to preside over peace and war. Ganasa is the first invoked and propitiated on every undertaking, whether warlike or pacific. The warrior implores his counsel; the banker indites the words Sri Ganasa at the commencement of every letter; the architect places his image in the foundation of every edifice; and the figure of Ganasa is either sculptured or painted at the doors of the houses as a protection against evil. Though often represented as four-armed, and holding the disc (chakra), the war-shell, the club, and the lotus, Ganasa is not bifrons, like the Roman guardian of portals. In every transaction he is 'Ad,' or the first, though the Hindu does not, like the Roman, open the year with his name. One of the portals of every Hindu city is named the Ganasa Pol, as well as some conspicuous entrance to the palace. Thus Udaipur has its Ganasa dwara, who also gives a name to the ball, the Ganasa deci; and his shrine is to be found on the ascent of every sacred mount, as at Abu, where it is placed close to a fountain on the abrupt face of the hill, about 1200 feet from the base. There is likewise a hill sacred to him in Mewar, called Ganasa Gir, tantamount to the Mons janiculum of ancient Rome. The companion of this divinity, the rat, indirectly receives a portion of homage, and with full as much right as the bird emblematic of Minerva.

The name Ganasa, from Gana and Isa, also Ganapatii, mean lord of the Gana. He has other names.—Dwi-deha, double-bodied; Eka-danta or Eka-danashira, single-tusked; Gajanan, Gaja- vadan, and Kari-Mukha, elephant-faced; Hera, boastful; Lamba—karna, long—eared; Lambo—dara, pendent—bellied; Vighnesha or Vigutha-bari, remover of obstacles.

Ganesa-janani, the mother of Ganasa; from Janna, birth. — Moor; Tod's Rajasthan, i. pp. 590—91; Dowson.

GANASA-GITA is the Bhagavat-gita with the name of Ganasa substituted for that of Krishna. It is used by the Ganapatii sect.

GANESA, an elephant with one task, held in reverence by Hindus.

GANESH CHATURTHI or Ganesh-chauth, also Pillayar Chatturthi, a Hindu holiday. On this day, which falls about the beginning of September, on the fourth day of the new moon, was formed Ganasa, called also Ganapatii, made from the turmeric and oil of the head of Parvati. Ganapatii has a man's body with the head of an elephant; his head is said to have been cut off or destroyed by Siva, when Ganasa tried to prevent Siva intruding on the privacy of Parvati when bathing. Clay images of Ganasa are made and worshipped for from one to nine days, and are then thrown into water. The Chinchor or Chinchi—
GANGA.

wad, who resides at a village of that name near Poona, is believed to be an incarnation of Ganesh, who promised an ascetic named Moroba, who lived in Sivaji's time, that he would be incarnate for seven generations in his family. The earth image of Ganesh is one of three forms in which the earth deity Mrittika is worshipped by Hindus. The first is the Naga-panchami, in which a feast a snake of clay is worshipped; the second is Gokulashtami, when a clay image of the infant Krishna is worshipped; and the third occasion is that on which Ganesh is worshipped, and this last day of the worship of Mrittika is observed with great pomp. The feast in honour of his birth, which is held on the 4th of the month Bhadrapad, and falls on the first days of September, seems to have some connection with the seasons of the year. The image of Ganesh is brought to the house with much pomp.

GANGA is a term applied to the sacred rivers of the Hindus, of which there are several kinds. —Ganges, Godavery, Kishna, Caumuya. The most sacred of the Ganges is the Ganges. Ganga-jal or Ganga-jala, is swarming by its waters; Ganga-bob, also Ganga-prapati or Ganga-yatra, committing a dead body to the river, or a Hindu brought to die there.—W.

GANGA, in Hindu mythology, the personified goddess of the river Ganges, the source of which the Saiva sects place in Siva's hair; whence, in graceful flow, she sprang radiant, and, descending, graced the caverns of the west.

The Vaishnava sects assert that it flowed out of Vaikuntha, from the foot of Vishnu, and, descending upon Kailasa, fell on the head of Siva, who shook some drops (Bindu) from his hair, and these formed the great lake called Bindu Sarovara, far to the north of Hindustan. Sometimes the Ganges is said to issue from a cow's mouth, and the cleft in the Himalaya is called Gungroti and Gaumukhi. Others make it arise from water poured by Brahma on the head of Siva; others, from the feet of Brahma; and others, from the fingers of Parvati. The Ganga is also called Dasahara or ten removing, as bathing in her waters on the tenth day of the month Jyaisha effaces ten sins, however heinous soever, committed in ten previous births. One of the holiest spots of the Ganges, is where it joins with the Jumna, near Allahabad, though, with Hindus, the sangam or confluence of any river is a spot peculiarly revered. A person dying at the confluence of the Ganges and Jumna is supposed to be certain of immediate moksh or beatitude, without risk of further transmigration. Professor Wilson, in his translation of the Mudra Rakshasa, describes Ganges as 'by the autumn led, fondly impatient, to her ocean lord, Toes her waves, as with offended pride, And pining fretful at the lengthened way.'

Though, as above related, the honour of having given birth to this goddess, the personification of the sacred stream of the Ganges, has been claimed for their deities both by the Saiva and Vaishnava sects, all sects and castes of Hindus worship this goddess of their sacred stream. Numerous temples are erected on the banks of the river in honour of her, in which clay images are set up and worshipped. The waters of the river are highly reverenced, and are carried in compressed vessels to the remotest parts of the country; from whence, also, persons perform journeys of several months' duration, to bathe in the river itself. By its waters the Hindus swear in courts of justice. Mr. Ward says there are 3,500,000 places sacred to Ganga; but that, according to Hindus, a person either by bathing in or seeing this river, may be at once as much benefited as if he visited the whole of them. For miles near every part of the banks of the sacred stream, thousands of Hindus of all ages and descriptions pour down every night and morning, to bathe in or look at it. Persons in their dying moments are carried to its banks to breathe their last, by which the deaths of many are frequently accelerated; and instances occur where such event has thereby been actually caused. The bodies are then left to be washed away by the tide, and numbers of them are to be seen floating up and down with every flood and ebb, or lying all along the banks, with vultures, adjutant birds, carrion crows, and kites above them. Several festivals are held during the year in honour of Ganga.

She is described as a white woman with a crown on her head, holding a water-lily in one of her hands, and a water vessel in another, riding upon a sea animal resembling a crocodile, or walking on the surface of the water with a lotus in each hand. There are other myths relating to Ganga.

The river goddess has some of the attributes of Pallas, being, like the Athenian Maid (Ganga never married), born from the head of Jove. The bard of the silver age makes her fall from a glacier of Kailas (Olympus) on the head of the father of the gods, and remain many years within the folds of his tiara (jita), until at length, being liberated, she was precipitated into the plains of Aryavarta. It was in this escape that she burst her rocky barrier (the Himalaya), and on the birth of Kumara exposed those veins of gold called jambuanjati, in certain places in the Ganges.

The river goddess, like the Nile, is the type of fertility, and, like that celebrated stream, has her source amidst the eternal glaciers of Chandragiri or Somadri (the mountains of the moon), the higher peaks of the gigantic Himalaya, where Parvati is represented as ornamenting the tiara of Iswara with a beamy moon. In this metaphor, and in his title of Somanatha (lord of the moon), we again have evidence of Iswara, or Siva, after representing the sun, having the satellite moon as his ornament. The Egyptians, according to Plutarch, considered the Nile as flowing from Osiris; in like manner the Hindu poet describes the fair Ganga flowing from the head of Siva, and Sir W. Jones thus classically paints the myth in his hymn to Ganga:

'Above the reach of mortal ken, On blest Cailasa's top, where every stem Glowed with a vegetable gem, Mahesa stood, the dread and joy of men; While Parvati, to gain a boon, Fixed on his locks a beamy moon, And hid his frontal eye in joind play, With reluctant sweet delay; All nature straight was locked in dim eclipse, Till Brahmins pure, with hallowed lips And worshiped prayers, restored the day, When Ganga from his brow, with heavenly fingers prest, Sprang radiant, and descending, graced the caverns of the west.'

According to another legend, the goddess Mera,

1170
daughter of Meru, became the spouse of Himalaya, from whose union sprang the beauteous Gangar, and her sister Ooma. Gangar was sought in marriage by all the celestials; while Ooma, after a long life of austerity, was espoused by Rudra. But neither sister was fortunate enough to have offspring, until Gangar became pregnant by Hutashna (son of fire), and Kumara, resplendent as the sun, illustrious as the moon, was produced from the side of Gangar. The gods, with Indra at their head, carried him to the Krittikkees to be nursed, and he became their joint care. As he resembled the fire in brightness, he received the name of Skanda, when the immortals, with Agni (fire) at their head, anointed him as general of the armies of the gods. The festival of the birth of this son of Gangar, or Januvi, is on the 10th of Joytee. Sir W. Jones gives the following couplet from the Sanscula:—'On the 10th of Jyestha, on the bright half of the month, on the day of Mangala, (a son) of the earth, when the moon was in Hasta, this daughter of Janhu brought from the rocks, and ploughed over the land inhabited by mortals.'—Cole. Myth. Hind. 119.

GANGA-BUL. Tin. Literally, place of the Ganges. A sacred lake on the mountain of Haramuk in Kashmir. It lies under the wildest and most lofty peaks of the mountain; is 14 miles long, and 200 or 300 yards wide, and is about 12,000 feet above the level of the sea.—Vigne.

GANGA-DHARA. Sansk. Bearer of the Ganges, a name of Siva.

GANGA-DWARA. Sansk. The gate or defile or passage of the Ganges; the modern Hardwar. In the Gaelic, Dwara becomes Dorras, in English a door.

GANGA-JAMNI, work in silver and gold combined, as with a silver ground and gold flowers, etc.

GANGA-KANDAPUR, in Tamil, Ganga-kandapuram, or, visited by the Ganges, a small town in the Madras Presidency, in lat. 11° 12' 30" N., long. 79° 30' E., population (1871) 1014. Close to the village is a temple consisting of one large enclosure, measuring 584 feet by 372. The Vimana in the centre of the courtyard is a very conspicuous building, the pyramid surmounting it reaching a height of 174 feet.—Imp. Gaz.

GANGAPUTRA, a tribe of inferior Brahmanas, who claim a right to attend pilgrims and direct their ablutions at Benares, and other holy places on the Ganges. At Benares, where they are most numerous, they claim a hereditary right to the bank between high and low water mark. Some follow agriculture.

GANGES, the great river of Northern India, is formed by the drainage of the southern ranges of the Himalaya. It rises in the Garhwal state, in lat. 30° 56' 4" N., and long. 79° 6' 40" E., and falls into the Bay of Bengal after a course of 1557 miles. It has been known to Europe from very early times. The fleets of the Egyptian kings sailed to it round the Peninsula of India and Ceylon. Seleucus Nicator is said to have penetrated to the mouth of the Ganges, and it had been sailed up by the Romans as far as Falirbrotha before the time of Strabo. Its valley seems to have been peopled by several races long before the Aryan Hindus arrived there, and many of the conquerors who have entered India from the north-west have striven to occupy the fertile valley of this great river. Hindu poets have celebrated its praises in a multitude of songs. The river is fabled in their mythology to be the goddess Gangar; they long to see it, to bathe in its waters and be purified from their sins, and at last to die on its banks, or to have their bones conveyed to it from the most remote parts of India. To Hindu raises such a question as in 2 Kings v. 12, for the Ganges is recognised as the most efficacious of all the Hindu purifying rivers. On its banks have dwelt the chief of the religious reformers whom India has seen. Its valley was the cradle of Buddhism, which, from its rise in the sixth century before Christ, gradually spread over the whole of India, was extended by Asoka to Kasmir and Kâbul, shortly after Alexander's invasion, and now prevails amongst 222 millions of men. Numerous dynasties have ruled there. The Andra race was in power in the Gangetic province of India about the beginning of the Christian era, but the most enduring was the great Kahatry family that long ruled at Indraprastha, and terminated with Priti-raj in A.D. 1200.

The whole valley is now part of British India. The river issues from the mountains at Gangotri, at an elevation of 13,800 feet, and is there known as the Bhagirathi. It issues from beneath a great glacier, thickly studded with enormous loose rocks and earth. The glacier is about a mile in width, and extends upwards of many miles, towards an immense mountain covered down to its base with perpetual snow, its glittering summit piercing the very skies, rising 21,000 feet above the level of the sea. The chasm in the glacier, through which the sacred stream rushes forth into the light of day, is named Gangotri and Gaumukhi, the Cow's Mouth, and is held in the deepest reverence by all Hindus; and the regions of eternal frost in its vicinity are the scenes of many of their most sacred mysteries. The Ganges enters the world no puny stream, but bursts forth from its icy womb a river thirty or forty yards in breadth, of great depth, and very rapid. From the source at Gangotri it runs in a generally south-easterly direction to Allahabad, to Sikrigali, and into the Bay of Bengal, by numerous mouths, having given off some of its waters to form the Hoogly, and it also anastomoses with the Megna. In its course it receives the Jumna, 860; Gogra, 606; Gandak, 450; Gunti, 482; Sone, 465; Kosi, 325; Ranganga, 373; Mahanadi, 440; Karunnassa, 140; Konib or Jamuna, 130; Alakanda, 80; Bhillung, 50 miles. 39,000 square miles are drained, exclusive of Hoogly. The Ganges is navigable for river craft as far as Hardwar, 1100 miles; steamers ply as far as Gurmuktesar, 393 miles above Allahabad, distant from Calcutta via Delhi 930 miles; at Cawnpur, 140 miles above Allahabad, the navigation is plied with great activity. It falls rapidly to Hardwar, which is 1500 miles from the mouth. At Allahabad, 840 miles from the sea, it receives the river Jumna, which rises at the south-western base of the Jummutri peaks. At about 240 miles from the coast it begins to divide into branches. The two on the west, called the Bhagirathi and Jalingi, unite to form the river Hoogly; the other stream passes through the Brahmaputra, with which the waters mingle, and are known as the Karnasna river. The Ganges receives from the left bank the Ramganga, Gunti, Gogra, Gandak, Kosi, and Mahanadi; and from the
right bank, the Kali, the Kali Naddi, Jumna, and Son. Some of these are equal to the Rhine, and none smaller than the Thames, besides many others of lesser note. It is owing to this vast influx of streams that the Ganges exceeds the Nile so greatly in point of magnitude, while the latter exceeds it in length of course by one-third. In the plain of the Ganges are the provinces of Bengal, Behar, the Doab or Mesopotamia of the Jumna and Ganges, Oudh, and Rohilkhand. It is of exuberant fertility. The population of the Gangetic Doab is 800 to the square mile. The chief towns on the banks of the Ganges are Hardwar, Bijnour, Farrakhabad, Cawnpur, Mirzapur, Benares, Ghazipur, Patna, Monghir, Bhaulpur, Rajmahal, Rampur, Fueva. Calcutta is below the sea level; Benares 265 feet above it; Allahabad 305 feet, and Agra 670 feet. The pre-eminently sacred spots on its banks are Gangotri, Hardwar, Allahabad, Benares, and Sauor Island, which are frequented by thousands of pilgrims from every province of the Peninsula.

The Gangetic Delta is an extensive tract of cultivated and forest-covered country, composed of alluvial or transported soil brought down the country by the Ganges and Brahmaputra rivers and their numerous tributaries, the water-sweepings of two basins whose aggregate area is 432,480 square miles. The Delta is intersected from north to south by many broad rivers, and by endless creeks running one into the other, filled for the most part with salt water when near the sea. This tract of land occupies approximately 28,080 square miles of superficial area, or double the area of the Delta of the Nile. Measuring from west to east, or from the right bank of the Hoogly river opposite to the Sauor tripod on the south-west point of Sauor Island, to Chittagong, it is 270 miles in width, presenting to the Bay of Bengal a series of low, flat mud-banks, covered at high water and dry at low water. A few miles from low-water-mark commence mangrove swamps; a little further inland, trees appear, and lastly cultivation,—the nearest cultivation in the central portion of the Delta being 47 miles from the sea. In the sea front of the Delta there are nine principal openings having a head stream, that is, having water flowing direct from the Ganges, or from the Megna or Brahmaputra. They are:

1. the Ganges; 2. the Megna or Brahmaputra; 3. Horinghatta; 4. Pussur; 5. Murjatta or Kaggaf; 6. Barapunga; 7. Mollichew; 8. Roymunghal or Juboona; 9. Hoogly. Besides these large rivers, there are numerous openings having no head stream, being mere salt-water tidal estuaries. The channels or headless rivers are the deepest, as no silt or deposit is poured into them from the higher lands. The tides in the Hoogly run with a rapidity in the springs of seven miles an hour, between Sauor and Calcutta. At Calcutta it is high water about 2 hours 30 minutes on full and change of the moon. The bore is of not unfrequent occurrence in this river.

This river's annual rise begins in the end of April, and continues to increase till the middle of August, when it reaches in many places 32 feet, and the level districts in its lower course are inundated. At Benares, after the Ganges has received the waters of its tributaries, the Kali Naddi, the Gunti, and others, the breadth varies from 1500 to 3000 feet; the average discharge each second of the year has been estimated at 250,000 cubic feet.

By the latter end of July, all the lower parts of Bengal contiguous to its banks are overflowed, forming inundations of a hundred miles in width, where little appears above the surface of the flood save isolated villages and trees. Banks of every kind then steer a direct course, husbandry and grazing are alike suspended, and the peasant sculls his boat across the fields. In some parts of Bengal, whole villages are everywhere now and then swept away by changes in its course, through districts from which, a few years before, it was several miles distant.

The Bhagirathi, Jalangi, and Matabhanga, are all offshoots of the Ganges, which unite to make up the headwaters of the Hoogy. In former times, the main volume of the Ganges was carried to the sea by one or other of these channels, but they now receive so little water as only to be navigable in the rainy season, and then with difficulty. Since the beginning of the present century, Government has undertaken the task of preventing these Hoogly headwaters from further deterioration. A staff of engineers is constantly employed to watch the shifting bed, to assist the scouring action of the current, and to advertise the trading community of the depth of water from time to time. In the year 1877–78, a total sum of £29,522 was expended on this account, while an income of £32,494 was derived from tolls.

The Ganges river basin embraces 391,100 square miles. Average discharge at Hardwar, when the river is at its lowest, 7000 cubic feet per second; at Rajmahal, a high flood discharge of 1,800,000 cubic feet per second, and an ordinary discharge of 207,000 cubic feet. The Ganges during its minimum discharge at the Bhagirathi head in April has a breadth of surface of 2800 feet, an average depth of 15 feet, its sectional area 45,000 square feet; and multiplying this with its mean velocity of 1·92, gives its discharge per second as 80,600 cubic feet. During the inundation the breadth of surface is 10,633 feet, average depth 30 feet, sectional area 318,990 square feet, mean velocity 4·25 = 1,355,707 cubic discharge per second.

The Ganges near the delta has frequently altered its course. Colonel Colebrooke mentions that, between 1779 and 1788 such an alteration had occurred at Colong, making a new channel 90 feet deep, above which the earth rose 25 feet, a removal of 115 feet of earth. Entire fields at times are hurled into the river, and large islands disappear rapidly when the power of the main current is made to bear on them. Budginga, Ganga, also Burha Ganga, is an old bed of the Ganges traceable below Hastinapura, Soron, and Bhojpur. Hooker, Him. Jour.; Markham's Himalaya, Col. Rev.; Royal Sanitary Commission Rep.; Imp. Gaz. GANGES CANAL, an important irrigation work and navigable channel in the North-Western Provinces, passing through the eastern portion of the Upper Doab, and watering a large tract of country, from Hardwar to Cawnpur, extending from lat. 26° 30' 30'' to 29° 57' N., and from long. 78° 18' to 80° 21' 15'' E. From the Ganges at Cawnpur to the Jumna at Agra the distance is nearly 200 miles. All this long tract is unwatered by a single natural stream. To remedy this the great Ganges Canal was projected by Sir Froby Cauley, K.C.B., during the administration of Lord Dalhousie. It was commenced in 1846, and was
opened in 1854. Its principal head is 2½ miles from Hardwar. At the 18th mile above Roorkkee the canal crosses the Solani river. From this point the main canal follows the watershed between the Ganges and Jumna for 181 miles to Nanun. From Nanun the eastern branch continues 170 miles to Elawa, where it falls into the Jumna, and the western branch of the same length falls into the Ganges at Cawnpore. There are two smaller branches of 83 and 10 miles long. It has an irrigating capacity of 1,205,000 acres. It has been an unfortunate canal; up till remodelled in 1866, it could not carry its full supply. Up to the end of 1872-73 it cost £2,187,740.

The Lower Ganges Canal, an important irrigation work in the North-Western Provinces, designed to water the whole southern portion of the Doab. —Imp. Gaz.

GANJODRAM. GANJA.

GANJOLO, a brick structure at Negapatam, supposed to be a Buddhist work.

GANJODRAM, mountain temple in Garhwal state, Panjab; lat. 30° 59' N., long. 78° 59' E., and 10,319 feet above the sea. It stands on the right bank of the Bhagirathi or Ganges, 8 miles from its source, in a small bay or inlet, surrounded by a wall of unhewn stone. The temple is a square building about 20 feet high, containing small statues of Ganga, Bhagirathi, and other mythological personages connected with the spot. Near the temple is anTag, a large tank, and the waters of the Bhagirathi and the river runs impetuously in its shingly bed, the stilled sound of the stones which it rolls along, mixing with the roar of its waters. Sooragarpara is the nearest of the peaks, and forms the western point of the great snowy hollow. Rudra Himala is the eastern, and forms the other point; but from that point runs down a huge snowy shoulder, that seems to give off or end in the mountains that surround, and form a great unbroken, though unequal, snowy ridge, bounding and confining the glen of the Bhagirathi. The other three peaks form different points in the back of the immense hollow, and altogether compose one of the most magnificent and venerable mountains, perhaps, that the world can produce.

Below Gauri Kundh the river falls over a rock of considerable height in its bed, and continues tumbling over a succession of petty cascades or rapids nearly all the way to Mindee ka Gadh. Above the debouch of the Ked or Ganga, the bed widens into a small shingly space, in which the river rapidly rolls. A bridge has been thrown across, and above the bridge is the small temple dedicated to the goddess Ganga or Bhagirathi. It is built on the sacred stone on which, as Hindus believe, Bhagirathi used to worship Siva Mahadeo. —J. B. Fraser, in Jam. Ed. Journ. 1820, iii. p. 229; Fraser's Himalaya Mountains; Herbert; Hodgson.

GANGRI or Kailas, a mountain range which extends in one unbroken chain from the source of the Indus to the junction of the Shayok, and forms the natural boundary between Ladakh, Balti, and Rongdo on the south, and Ruthog, Nubra, Shigar, and Hunnagar on the north. It has six passes, at heights from 15,000 to 18,105 feet. Gangri, in Tibetan, means 100-mountain. Kailas means crystaline or icy, and is derived from Kolas, crystal, which is itself a compound of Ke, water, and Las, to shine. Kailas, or Ice

Mountain, is the Indian Olympus, the abode of Siva and the celestials. The Tibetans look upon Ti-se or the Kailas Peak as the highest mountain in the world. Near the Gangri range, four rivers take their rise,—the Indus, called Sing Chin Kamba or Sing Jing Kamba, the Map-chu Kamba or Karnali, and the Brahmaputra, called to the eastward Tamkyak Kamba, also the Lang Chin Kamba.

GANGUA, a valuable timber tree of the Andamanas.

GA-NHAT, a god of the Singhpo.

GANITRUS SPIRERICUS, Gauri. Its nuts, cleared of the soft pulp or flesh that covers them, are curiously sculptured, and, being hard and taking a fine polish, they are frequently set in gold and strung into necklaces. Ganitrus spirericus is a middle-sized tree, common in various parts of India, as well as the Malay Archipelago. Its nuts, and those of Monocera tuberculata, W. and A., from the forests of Travancore, also those of Elaeocarpus lanceefolius, are what are principally used as beads.

GANJ, HIND, is a mart or market; a granary, especially one of grain; and in Bengal and Hindustan is applied to any village or town which is an emporium for grain and other necessaries of life. It is used as an affix to proper names, as Islam-ganj, Hardeo-ganj, Captain-ganj; just as ship or chipping, which are of the same meaning as Ganj, is in English, as Chipping-Sodbury, Chep-stow, Chippenham, Cheapside.

Ganj-i-Shahid, a sepulchral mound where Mahomedans have fallen and been buried. —Elliot.

GANJA. HIND, TAM, TEL. Hemp-plant.

Ganjists... ARAB. [Ging-lacki] lacki, MALAY. Ma-fuen, Chu-tsao, CHIN. Ganjika, Bijia, . SANSK. Gindali, . JAY. . .

The dried hemp plant which has flowered, and from which the resin has not been removed, is called ganja. It sells for 12 annas to 1 rupee the seer in the bazaars. It yields to alcohol 20 per cent. of resinous extract, composed of the resin (charras) and green colouring matter (chlorophyll). Distilled with a large quantity of water, traces of essential oil pass over, and the distilled liquor has the powerful narcotic odour of the plant. The ganja is sold for smoking chiefly. The bundles of ganja are about 2 feet long, and 3 inches in diameter, and contain 24 plants. The colour is dusky green, the odour agreeably narcotic, the whole plant resinous, and adhesive to the touch. The natives cut the plant when in flower, allow it to dry for three days, and then lay it in bundles averaging one seer weight, which are distributed to the licensed dealers. The best kinds are brought from Gwalior and Bhiwtur, and it is also cultivated of good quality in a few gardens round Calcutta. In Jessore the drug is known to be produced of excellent quality, and to a very considerable extent of cultivation. In the north of Africa, South America, Turkey, Egypt, Asia Minor, India, and the adjacent territories of the Malay, Burmese, and Siamese, hemp and its products are used in various forms by the dissipated and depraved, as the ready agent of a pleasing intoxication. The leaves or young leaf-buds of the hemp plants are smoked by itself, or rubbed between the hands and added to tobacco to impart an intoxicating power. —Faulkner; Royle; Waring; Birdwood.
GANJ, a small seaport town in lat. 19° 22' 27" N., long. 85° 2' 52" E., with a population of 4,163 souls. It gives its name to a revenue district in the north-east of the Madras Presidency lying between lat. 18° 15' and 20° 15' N., and between long. 83° 49' and 85° 15' E.; area 5313 square miles, population 1,520,088. The chain of the Eastern Ghats is here known as the Malaya; and its peaks are—Mahendragiri, 4923 feet; Singharaj, 4976; and Deodonga, 4534. Ganjam anciently formed part of the southern kingdom of Kalinga, and it was not until the long line of Gajapati or Ganga Vansa kings (1182–1392) occupied Orissa that the adjoining district of Ganjam was annexed to that province. It suffered from famines in 1789, 1791, 1819, 1836, 1866; and in the last about 60,000 of the people were lost. The town of Ganjam was nearly deserted in 1815, in consequence of fever. The district contains several petty chieftainships, and it embraces a large portion of the mountainous tracts known as Khondistan, and the valley of Chocapaud. Chilka lake, in Ganjam, is 35 miles long and about 8 broad, with numerous islets. The aboriginal tribes inhabiting the hill tracts are principally Kandh (55,735) and Saura (21,656), who have now nearly all embraced some form of Hinduism. During a campaign in 1836, it became known that the Khand were addicted to sacrificing human beings, and the rite has now (1892) been suppressed. Uriya are chiefly found in the north of the district, extending as far south as Parla Kimedi. South of Kasibuga, and throughout the Chiecaole division, the larger number of the inhabitants are Telig. The Uriya language prevails in the northern part, and the Telig in the southern. It has been stated that the town of Ithapole in the southern division the Telugu prevails. The Khand race have a language peculiar to themselves, which was reduced to writing by Captain J. P. Frye of the Madras N. I. Of the inhabitants, about 450,000 are Uriya. Many of the Uriya Brahmins obtain their livelihood as cultivators. Brahmins of this sect also trade, and follow the occupations of brick-makers, brick-layers, etc. The chief towns of the Ganjam district are Berhampur, Chiecaole, Parla-Kimedi, and Kalingapatam. Chiecaole is the principal civil station in the Ganjam district. It is in lat. 18° 18' N., long. 85° 38' E., about 567 miles from Madras, and has 15,587 inhabitants. It lies four miles direct west of the sea, and is situated on the north bank of the river Languliya. It is the station of the judge and the sub-collector. GAJ—i-BAR, a bald tract in the central dorsal plateau in the Manja or middle part of the Bar district. The soil of the Ganj-i-Bar is intensely arid, often saline, and produces only some salsolaceous plants, with a few bushes of jhad. GANNA. HIND. Saccharum officinarum, sugar-cane. The name differs but little in almost all languages to express the same object.—Hebrew Kaneh, Arabic and Persian Kunnat, German Kanne; Greek, Latin, Italian, Spanish, and Anglo-Saxon, Canna; and hence the English cane and sugar-cane, and the many words derived from it, which are applied to vessels and utensils bearing resemblance to the shape of hollow reeds, as can, cannikin, canal, canister, and canoe, which latter is derived from the passage in Juvenal (Sat. v. v. 89). Minch and abhors a similar origin to the word guna, 'Guna, ex Lat. canna, quia consistit canna ferrea,' regarding which it is to be observed that no one has succeeded in giving a better etymology. From the Hebrew name is the Hanah, or measuring reed of the Jews, equal to six cubits, which has its counterpart in the Bons or bamboo measure of the Hindus; the Roman Decempees and the Greek Akaina, all of six cubits or ten feet.—Elliot. GANNET, a sea-bird, the Sula alba, which measures about 5 feet across, and 24 feet long. Also the Pelecanus bassanus. GANONG, generally called Ayen Papas, hot springs in Nanning. All the hot springs of the Malayan Peninsula, and some of those in Sumatra, occur in swampy flats. That of Ganong occurs at or close to the line up to which pluvinic action has converted the rocks of the district into granite. GANPATI, the Hindu god of wisdom. See Ganapati; Ganesh. GANTA BHARANI. Tel. A species of Clerodendron, a low herbaceous plant, common about Lamsingi in Vizagapatam; the roots are largely exported for medicinal purposes. GANTH, also Ganthi. HIND. A knot. Mahomedans usually keep a string for their children, on which they tie a knot each birthday; hence Baras-gan'th, a birthday knot, a birthday. In land revenue the twentieth part of a mana or bigha. GANTHAA, a bell. One is used in the holy ceremonies of Hindus, and is rung at certain times to keep away evil spirits. These bells, as well as the lustral spoons, are usually surrounded by the figure of the deity in whose worship they are used.—Cole. Myth. Hind. p. 380. GAO, written also Gan or Goan. HIND. A village. Travellers in India reckon the day's distance of journeys by the Gao or village. Ds Gao would mean ten days' journey. GAO. HIND., ZEND. A cow. In Hinduism, the Gao or cow is symbolic of Pritha, the earth. Gao has numerous combinations. Gao-char or Gao-charhai, pasture land kept free from cultivation, as the grazing ground of the village. Gao-dana or Godana, the gift of a cow to a Brahman or to a bridegroom, or at a religious ceremony. Gao-kos is the distance that is measured by the audibility of the bellowing of a cow from one extremity to another. Gaola or Gaola, contraction from Gopala, a cowherd (perhaps from Gala, milk). Gaola, the milkman race; they have considerable herds of cattle. Gao-labh, swearing while holding a cow's tail. Goa-than, a village site. Gao-ran, grazing ground. Gao-lochan, gall stones extracted from the gall bladders of dead cows, much used in medicine, also in charms, and in painting.—Gen. Med. Top. p. 186; Tr. of Hind. ii. p. 40. GAO. HIND. An ordeal. See Divination. GOAHATTY, a town in Assam, the ancient Kasawati. See Gowhatty. GAPO, a Hindi word meaning a village, is appl'd to hamlets and townships in every part of Ind. Its origin in Hindi is obscure and it is written in the English Gaum, Gouv, and Gaum, as Mulligaraum. It is a vernacular term from the Sanskrit Grama or Gramma, Gramin or Gramum, and still preserved and used in the word Grammadvana, the village deity, and used with inflections in Tamil, Malealam, Telugu,
and supposed to be represented in the Chinese Heong and Singhalense Gama.

Gaon-barah, in Bengal, a village authority.

Gaon-kari, a freeman of a village, either free from being of the original settlers, or having purchased it by fee, by some useful act, as digging a well, repairing a wall, building a temple.

Gaon Korava, a section of the Korava race. See Korava.

Ga'ooru, MAHR., a patel.

GAO ZABAN. PERS. Lit. cow's tongue. The plants of the bazaars of India are the Cacalia Kleinaia, Anisomeles Malabarica, Trichodesma Indicum, Heliotropium erosum, H. ophicoglossa, Onosma bracteatum, O. macrocephala, and Macromia euchroma. Eastern physicians suppose them to have cooling properties, and give them in disorders arising from heat of body, external or internal.

GAR, TIBET, a fort; in Sanskrit, a district, a region, as Kash-gar, Gujer-gar, Chutchwaha-gar; and Ghar, HIND., is a house, a fortalice, a fortified town, as Futtchghar. Gharri, a fortalice. Nagar, also Nagara, SANSK., a town, a city, as Ahmednagar, Farrakhnagar, or simply narga, the town, is from the Sanskrit Nagara, and is often in English written Nagore.

GARLA, an agricultural tribe in Saharanpur, Roorkee, Rampur, Sultanpur. They are Mahomedans, and are supposed to be converted slaves, like the Jhooa.

GARARIGA or Gadarya, from Gadur, a sheep, a shepherd, and goat race, scattered over all the N.W. Provinces of India, but most numerous between Allahabad and Farrakhabad. They are in many clans, which do not intermarry.—Bakarkasan, Barkata, Bharariya, Chak Bareya, Chikwa, Dhanger, Illahabadi, Jaunpuri, Namadhalwaiy, Nikhar, Pahwari, Pachhade, Tassela. The Bharariya take their name from Bhera, a sheep. The Chikwa are Mahomedans. The Dhanger, Jaunpuri, and Nikhar also weave coarse blankets. They marry the widow of a deceased brother. The Gari, or shepherd tribe, are in dignity of caste in much the same position as the Gop. In the west of India they founded a dynasty, that of Holkar, which still flourishes. They tend sheep and make blankets from their wool—a bad conjunction of trades, as the poor sheep are invariably short when blankets are in most request.—Dalton, Ethol. of Bengal, p. 317.

GARBHA. SANSK. A dome of a Buddhist cave; also pregnant. Garbhadana, a Hindu rite performed on the first indications of pregnancy.

GARBHA. The nine days preceding the Dasara are the Nao-rati, during which a Brahman is engaged to read the praises of Durga, and on the tenth performs the homa or fire sacrifice, in which rice and ghee are poured into the fire. Banya women keep up a dance called Garbha.

GARCE, in Telugu Garisa, a Madras grain measure of 400 paras = 9256 lbs. The Madras olluk is a measure of 11719 cubic inches. The Madras paidi is a measure of 8 olluks, and the Tamil marakal measure is 8 padi.

GARCAS AB HORTO, physician to the viceroy at Goa, author of a work entitled De Arom. et Sinu. Historia, 1567.—King.

GARCIA SIRO SILVA FIGUERIA, in A.D. 1627, visited Persia on a diplomatic mission.

GARCINIA, a genus of the Garciniaceae, the mangosteen tribe, a natural order of plants, consisting of trees or shrubs growing in Ceylon, the Peninsulas of India, the Khasayan mountains, Sylhet, Burma, Andamans, Java, and the Moluccas. The species of this order all abound in a viscid, yellow, acrid, and purgative gum-resinous juice, resembling gamboge. This gum-resin is obtained by removing the bark, or by breasting the leaves and rocking shoots. It is met with in commerce as the fine or gum gamboge, cake or lump gamboge, and coarse gamboge. The Garcinaceae genera are—Garcinia, Mannea, Mesua, Calophyllum, Kayea, Calycasenia, Rheedia, Pundatbesa, Moronoba, Mieranthera, Quapoya, Clusia, Tavomita. Several of the Garcinia genus yield edible fruits, and one of them is the mangosteen fruit tree, G. mangostana, L., a tree of the Malay Peninsula and islands of the Moluccas. G. Kydia, Roxb., of the Andaman Islands, is a tree with a sharp but agreeably acid fruit, similar to the large fruit of G. pedunculata, Roxb., which grows in Rumpur. G. paniculata, Roxb., a tree of Sylhet, has a palatable fruit something like the mangosteen; G. Roxburghii, Wight, a tree of Travancore, Malabar, and Chittagong, has an edible but very acid fruit; G. purpurea, Roxb., grows on the western coast of peninsular India. The fruits of several other species of the Garcinacea are brought to market in the countries where they grow, but they are regarded as very inferior. The mammee apple, or wild apricot of S. America, of another genus, is said to be very delicious. Its seeds are anthelmintic; its flowers yield on distillation a spirit known as Eau de Cireole, and wine is obtained by fermenting its sap. Mr. Gambo enumerates 22 species of Garcinia.—Roxb.

Garcinia cambogia, Desrours, not Roxb.

A tall tree, growing in Ceylon up to 1500 feet, grows also in Travancore, in the forests of Malabar; is very abundant in Tenasserim, and very common in Siam and Cambodia. It is common in all the western forests of the Madras Presidency. A semi-transparent pigment exudes from the trunk, very adhesive, but quite unsuitable as a paint; the acid rinds of the ripe fruit are eaten, and in Ceylon are dried and eaten as a condiment with curries. It yields an excellent, straight-grained, lemon-coloured, slightly elastic wood, which is easily worked, and would answer for common furniture.—Roxb.; Thwaites; Reddome.

Garcinia cornea, LINN., of E. Bengal and Burma, has a heavy brown-coloured wood, and yields a sort of gamboge.

Garcinia cowa, Roxb. ii. p. 622.

Young-tha-la-su, DURK. Cowa, COWA. 40M. HIND. Young-tha-za.

This tree grows in Assam, Andamans, Bengal, Chittagong, and Burma. It is of a middle size, and handsome; it yields an inferior sort of gamboge, and the fruit, edible, though not the most palatable.

Garcinia dulcis, KURZ, a tree of the Andamans, with a close-grained hard wood.

Garcinia heterandra, Wall., is the G. elliptica, Wall. and Kurz, and the Tha-nat-tau of the hills.
of Burma up to 3000 feet. It yields a superior kind of gamboge.

Garcinia lancefolia, Roxb., the G. purpurea, Wall., and the Kirindur of Sylhet. Grows in Assam, Chittagong, and Sylhet.

Garcinia loniceroides, T. And., is the G. succifolia, Kurz, of the swamp forests of Pegu. Yields a gamboge, but scanty and inferior.

Garcinia mangostana, Linn., mangosteen.

Mangostun of BOMBAY. Mangungusta. MALAY. Mangosteen.

Mangostis, Bugis of Ceylon. Manggis Malaya of Baluchistan.

Shan-chah, W. CHIN. Java, Sundan.

Mangos, LAM PONG. Mangu. 

A prolific tree of the Malay Peninsula and the Archipelago, which yields the mangosteen, the most palatable of all known fruits. It is a very handsome tree, the foliage, which is large and opposite, being of the darkest shining green. The fruit is a drupe as large as a moderate apple; it is composed of an outer skin of a soft and fibrous nature, brownish-red or dark purple on the outside, but when cut, of a bright crimson; the snow-white pulp which envelopes the seeds, lying within this, has an appearance no less delightful to the eye, than the flavour is grateful to the palate. Its characteristic quality is extreme delicacy of flavour, without being rich or luscious. When cultivated, as in the peninsula of Malacca, it fruits twice a year, being ripe in July and December, yielding 1000 fruits; it grows in perfection as far as 14° N. of the equator, and 7° S. of it. A congenital proportion of heat and moisture throughout the year seems much more requisite than soil or latitude for the successful growth of this fruit. The leaf or rind of the mangosteen fruit, and the bark of the katingor or wild almonds (Terminalia catappa), are used for dying black, also in dyeing. It has been introduced into Travancore.

—Crawford's Dict.; Low's Sarawak; Marsden's Sumatra, p. 97; Roxb. ii. p. 618; Voyt; Gamble.

Garcinia morella, Desrons.

Aradl, S. CAN. | Gokatoo, SINGH. | Kana-goraka, W. CAN.

Punar pulhit, ... | The Gunn-resin.

Sanatosei, BURM. | Rewa-chini. | MAHÉ.

Gota gamba, HIND. | Makki, TAM.

A middling-sized tree of E. Bengal, Assam, Khasiya, Ceylon, and S. India. In S. Canara, in the moist forests of the plains and ghats, up to 2000 feet elevation; Ceylon, up to 2000 feet elevation; also in E. Bengal and Assam. It is the true gamboge tree of commerce; and the pigment which exudes from wounds in the trunk is largely collected and exported from Ceylon and Siam; but little or no attention seems to be paid to it in British India. In the Madras Presidency, Colonel Beddome only met with the tree in S. Canara. It is closely allied to G. pictoria, which is the common species of the Madras Presidency, and scarcely distinguishable, except by the female flower.—Beddome, F. S. p. 86; Gamble.

Garcinia ovalifolia, Hooker.

Xanthochymus ovalifolius, Roxb.

Ella-gokatu, ... SINGH. | Kokati, ... TAM.

A tree of the Western Ghats.

Garcinia paniculata, Roxb., the Bubi-cowa of Sylhet, E. Himalaya, Khasiya, and Chittagong.

Garcinia pedunculata, Roxb., Tikal, HIND. Tikur, HIND. A tree of Rungpur, Goalpara, and Sylhet; its fruit weighs about 2 lbs. The fleshy part has a sharp, pleasant acid taste, and is used in curries sliced; they keep for years, and might be useful in long voyages. Wood used for planks.—Roxb. ii. 625.

Garcinia pictoria, Roxb. ii. p. 629. Hebraden- dorh pictorum, Christison. It yields osara or purple, a gamboge at least equal to that of Siam or of Ceylon. This is a very common tree in all the western forests of the Peninsula, up to about 3000 feet elevation. It is closely allied to G. morella, but differs in the female flower. The pigment is excellent, and quite equal to that of G. morella. The timber is used by the natives for various purposes.—Roxb.; Beddome.

Garcinia purpurea, Roxb., Bedd. G. Indica, Choisy. A tree of the Canara and Konkan Ghat. The fruit has an agreeable acid flavour, and it is preserved in syrup. The seeds furnish a concrete oil, known as the kokum.

Garcinia speciosa, Wall., Pa-la-wa of the Burmeese, grows in Tenasserim and the Andamans. It is an evergreen tree, with thin greyish-black bark. Its wood is said to be used by the Anadamans for their bows.

Garcinia stipulata, T. And., the Sana—kadan of the Lepcha and Bhatan, up to 4000 feet. Its fruit is eaten. Its fruits and gum give a yellow gum, but it is not used.

Garcinia Travancorica, Bedd., Malam pongu, TAM., of Tinnevelly. This is a very beautiful, middling-sized tree; flowers and fruits in August. The tree is confined to the southern portions of the Travancore and Tinnevelly ghats forests (3000 to 4500 feet elevation), but is most abundant in localities where it grows (Mutthi-kuli vayal, Travancore, Calched Hills, Tinnevelly). Every portion of the tree yields abundance of a bright yellow gamboge, which has not yet been examined. It is a highly ornamental tree, and seed has been transmitted to the Ceylon and Bengal Botanical Gardens.—Beddome, F. S. p. 173.

Garcinia Wightii, T. And., a tree of S. India. Its gamboge is very soluble, and yields a good pigment.

Garcinia xanthochymus, Hook. f., X. pictorius.

Tepoo, AsSAM. | Iswara-manadi, TEL. | Mastau, BURM. | Tamalanau; Chittaka, TAM.

Dampul, HIND. | Mrukku, TAM.

Maohla, PHEKIAL.

This is the gourka tree; it yields a large quantity of indifferent gamboge.

GARDAN. HIND. The neck. Gardani, a silver neck ring, put loosely around the neck of Mahomedan girls in India, on which at each birthday a silver loop or ring is strung. See Baras-ganth; Ganth; Sal-girah.

GARD—DEZ. In Afghanistan, remains of pyre- trees or fire-altars are still to be seen on its hills, as also at Bamiain, Seghan, and other places, showing that fire-worship had existed to a certain extent. See Kafir; Gab'r.

GARDENIA, a genus of plants of the order Cinchonaceae and section Gardeniae. The known species in the S.E. of Asia are about 23 in number. G. amoenae, anisophylla, arborea, calycalata, cinnata, Chinesis, coronaria, costata, densa, dumetorum, eneandrum, floride, gymnifera, latifolia, longispina, lucida, macrocarpa, rotheimania, mon-
tana, radicans, Thunbergia, turgida, uliginosa, obtusifolia, and sessiliflora. G. florida and G. radicans are known as Cape jasmine, their flowers are highly scented; colours pink, white, and pale yellow. G. campanulata is a shrub of Chittagong. Its berry is about the size of a golden pippin apple, and is employed as a cathartic and anthelmintic. One species of Gardenia (Telaga, TEL.) is a tree of the Godavery forests, and furnishes a very hard wood, which would be very good for turning. G. Fortuniana is a fragrant Chinese plant, now common in English gardens, to which it was introduced by the Horticultural Society in 1845. G. montana is common in the coast and inland jungles of Bombay, and may be recognised by its straight stem, long stout thorns, and general absence of leaves. The wood is hard, but always small, never squaring to more than 3 inches. G. obtusifolia, Roxb., a timber tree of Purna.—Fortune's Tea Districts, p. 17; Dr. Gibson; Roxb. i. p. 709.

GARDENIA CORONARIA. Buch.

A tree of Chittagong, Moulmein, and Tenasserim. It produces a profusion of flowers that are white when they first open out in the morning, but on exposure to the sun become quite yellow. Wood used for building purposes. Is a strong, tough wood, and useful for turning. Fruit edible.—Mason; Voigt; Cal. Cat. Es. 1862.

GARDENIA ENNEANDRA. Kon.

G. latifolia, Roxb. | Bikki, ... | Tel.
A small tree of peninsular India; furnishes a light wood of little use. Native combs are made of it.—Voigt; Mr. Latham.

GARDENIA FLORIDA. Linn.

Wax-flowervGardenia, Eng. | Shau-chi-tse, ... | Chin.
Gundhuraj, ... | Beng. | Gul-chand, ... | Hind.
Thet-ya, ... | Birm. | Gundhuraja, ... | Sansk.
Togu-han-pau, ...
Wax-flowers Gardenia is a shrub of slow growth, cultivated in the Moluccas, China, and India. Both double and single varieties are common in gardens. Its pure snowy blossoms, strongly fragrant, smell like the narcissus, and contrast delightfully with the thick deep green foliage in which they are set.—Roxb. i. p. 703; Gen. Med. Top. p. 185; Mason; Gamble.

GARDENIA GUMMIFERA. Linn.

Gardenia arborea, Roxb. | Chiri bikki, ... | Tel. | Chitta matta, Garaga, Tel.
A large shrub or small tree, with large fragrant flowers, which in the morning are white, and become yellow by the evening. The wood is hard. The natives eat the fruit. It grows in Ceylon, in the Gingi Hills, on the Godavery, and in the Circars, and is very common about Duddi, on the Guptruber river; grows wild on the hills in the Kotah jungles, the leaves and unopened blossoms being shrouded at the point in pure fragrant gum-resin, said to be one of the sources of the Dikamally resin.—Roxb. i. p. 707; Gen. Med. Top. p. 185; Voigt; Beddome.

GARDENIA LATIFOLIA. Aiton, Wilde.

Papara, ... | Hind. | Karinguva, Kokkita, Tel.
Kumbay maram, ... | Tam. | Kurukiti, ... 
Bikki, Kova mande, Tel. | Pekka karinga, ... 

Grows wild in the moist Kotah jungles, and is also cultivated in the gardens. It is a small tree in the south of the Peninsula of India, and also on the Godavery. Wood close-grained, and promises well for turning.—Roxb.; Gen. Med. Top. p. 185; Beddome.

GARDENIA LUCIDA. Roxb., W. and A. Gardenia resinifera, Roth.

Kun khan, ... | Ara. | Cumbi, ... | Tam.
Tayy-tham-by-ah, ... | Birm. | China karinguva, ... | Tel.
Dikamally, Dik., H. | Tels. | Tuns. maga, ...

Grows in the Southern Mahatta country, the Circars, on the Godavery, Chittagong, and Buruna, and has a close-grained wood, well adapted for the lathe, like that of several other species of Gardenia and Randia; it is used for making combs. A cubic foot weighs 49 lbs. To the first branch is 15 feet, and girth at 6 feet from the ground is 3 feet. Its resin, Cumbi-pisin, Tam., has a strong disagreeable smelling gum-resin, procurable in most Indian bazaars. It is much used, dissolved in spirits, as an external application, for cleaning foul ulcers, and in cases of worms in children.—Roxb. i. p. 707; Voigt; Dr. Brandis; Beddome.

GARDENIA RADICANS. Var. G. grandiflora, Lour. Cape jasmine.

Hwang-chi-tse, ... | Chin. | Muh-tan; Yueh-tan, Chin.
This favourite shrub is largely cultivated in Ho-nan in China, also in Cochin-China, and in Indian gardens. Its flowers are excessively fragrant, and are said to be used in flavouring tea. It should be planted in a well-manured flower bed or border which has been drained with sand; they require a soil more approaching to sand than clay, and plenty of water; propagated by cuttings in boxes or seed-pots during the rains.—Riddell; Smith.

GARDENIA RUBRA. Hung-chi-tse, Chin. Gardenia. Sze-chuen in China, and said to have brilliant red flowers. Its seeds are used to dye articles of an oecrous red colour.—Smith.

GARDENIA TURGHIDA. Roxb. Nunjoonda maram, Tam. A tree of Bhutan, N. Canara, and Berar. Both it and G. montana are in Wight's Fe. ii. t. 577, 579; Roxb. i. p. 711; Wight; Gibson.

GARDENS and Gardeners.

Jardin, ... | Fr. | Giardinello, ... | Fr.
Garten, ... | Ger. | Huerta Jardin, ... | Sp.
Bagh, Baghichia, ... | Hind. | Tota, ... | Tel.
Alike amongst Mahomedans and Hindus, the formation of a garden is a place of retreat and a great object of desire. In Wilson's specimens of the Hindu drama, which he translated from the Sanskrit, the Necklace and the Toy Cart contain beautiful allusions to gardens. 'The garden is now most lovely. The trees partake of the rapturous season, their new leaves glow like coral; their branches wave with animation in the wind, and their foliage resounds with the blithe murmurs of the bee. The bakula blossoms lie around its root like ruby wine; the champaka flowers blush with the reddines of youthful beauty; the bees give back in harmony the music of the anklets, ringing melodiously as the delicate feet are raised against the stem of the asoka tree.' Toy Cart, Act 8, p. 125, says:

'Look round the garden with these stately trees, Which daily, by the king's command, attended, Put forth their fruits and flowers, And clasped by twining creepers, they resemble The manly husband, and the tender wife.'

And the Mahomedans in India also give them loving names, as Lai Bagh, Farakh Bagh, Roushan.
GARH-BHEL.

Bagh, Ruby Garden, Garden of Delight, and Ornamental Garden. In this they resemble the Dutch.

Gardens of British India are all Hindus, and constitute distinct castes. The largest number of them are the Malli, who give their name to the bulk of the gardening tribes. The Koeri gardeners of Hindustan in Behar grow the poppy. The Tota-kara of the Tamil people and the Teling Totavada are good gardeners. The Malli are supposed by Mr. Campbell to be a considerable and widespread people. Between Ambala and Dehli are a good many Malli villages, and the race are scattered about the N.W. Provinces as gardeners. They are common about Ajmir, and on the southern frontier of Hindustan. South of Jubbulpur there are many, and are mixed with the Kurmi. All through the Mahratta country they are mixed with the Kunbi; and most of the potails are either Kunbi or Malli, and extending with the Kurmi far to the east, the Malli into Orissa, and the Kurmi into Mahrathum and other districts of Chutia Nagpur.

The formation of a garden with Hindus assumes a religious character, and their Banotsarg ceremony consists in their marrying a newly-planted orchard to the neighbouring well, without which it would be held improper to partake of the fruit. The British have formed several agri-horticultural societies, each of which has its garden, with economic and ornamental plants. That best known is on the banks of the Hoogly, at Garden Reach, Calcutta, over which Dr. Willich long presided. The Government garden, Saharanpur, was under the care of Drs. Boyle and Jameson. The Madras Agri-Horticultural Garden in 1853 had 996 species of plants. There is one at Dapooli, near Poona. The Government Botanical and Horticultural Gardens at Ootacumund has a valuable collection of plants. The Mysore Government Garden at Bangalore, in the old Lal Bagh, was well known; and the garden at Peridenia, in Ceylon, under Mr. Thwaites' care, attained great perfection.

A botanical garden is kept up at Batavia in Java, at a considerable expense, defrayed by the Netherlands Government. The Indian Government gardens, as also those of the agri-horticultural societies, are for the object of encouraging the cultivation of useful and ornamental plants. European and native soldiers form kitchen gardens.—The Necklace, Act 1, p. 272; Specimen of the Theatre of the Hindus, translated by Mr. Wilson; Chou-Chou, p. 218; C. pp. 105, 106.

GARH-BHEL of Kukusthan ruled in Balabhipura in S. 523; he is surmised to have been a son of Bahram Gour, one of whose sons, it is known, obtained dominion at Patan. All that is known of him is from a passage in an ancient Jain MS., which indicates that in S. 523, Raja Gardhabhela of Kukustha or Suryavansa, ruled in Balabhipura.

GARDOKI, Garo, Garoo, Gottap, Sur, Yeogar, or Gurtokh, is known by all these names. Rudokh is to the east by south of the Padgong lake, at about lat. 35° 25' N., and long. 72° 40' E., and Gardokh between the sources of the Indus and Sutlej, at about lat. 31° 40' N., and long. 80° 25' E. Through both these towns from Leh there is a route to Lhasa, the more direct one by Gardokh being 1350 miles in distance, or 4 months' journey. By the route by Rudokh the Sok-po are said to have invaded Ladakh in 1826-27, and again 1800 Chang-pa in 1834, the latter rapidly retreating as the Kashmir troops approached. Shortly after both Rudokh and Gardokh fell under the dominion of Maharaja Gulab Singh; but disasters attending his army in 1842, the old boundary between Ladakh and Chinese Tibet was once more re-established. Another town, Shipki, is just without the Bassahir frontier, and 100 miles from the termination of the Hindustan and Tibet road at Sarchun. From it there is communication with Simla, Rampur in Bassahir, and Kulu. The trade entering the Panjab from Gauri Khorsun is considerable. Shawl-wool comes from Chanthan in the Vicinity of Rudokh, a tract of country long celebrated for the fine fleeces of its sheep and goats. The people of the north are active traders. They proceed to Leh for charras and to Gardokh for shawl-wool, giving in exchange money, cloths, and spices. The mountain paths are scarcely practicable for laden mules, and merchandise is carried chiefly on the backs of sheep and goats. An annual fair is held in November at the capital of Rampur on the Sutlej. The town is of some importance, as the point where the commercial routes from Leh, Gardokh, and Simla meet, and also as a seat of the paschmina from Bassahir catches up the Hindustan and Tibet road at Sarchun, and passes by Kotgarh to Simla, and from Rampur direct by Spiti to Leh or to Sultanpur in Kulu, and thence to the Panjab. Garo is the most famous mart for wool in Chinese Tartary, and there is a fair of 10,000 or 22,000 people in July, well attended by merchants from Manbhum and Ladakh, and sometimes from Yarkand. Wool, borax, and salt are the principal exports, and these articles are exchanged for the produce of the plains of India. The pass over the range between Garo and the Sutlej is 19,200 feet above the sea. It is near the source of the Indus river. The Garo river is the Sing-e-chen or Indus, also called there Gar-jungh-chu; and there is no great eastern branch, as some suppose. At Garo, according to Moorcroft, it is a very insignificant stream.—Moorcroft's Travels; Capt. Gerard's Kunawar.

GARG, a celebrated rishi, and founder of the Garga family, one of the 66 subdivisions of the Kanoujia Brahmans.—Wils.

GARGA, a Hindu religious sage, a follower of Kapila, who is mentioned in several Puranas. He was born at Mithila, and resided on the banks of the Gandak river. He taught that final emancipation would be obtained by ardent devotion in religious duties, whatever opinions might be held.—Ward, iv. p. 40.

GARGHANSI, a tribe of Rajputs in Sugri and Mahul of Azimgurh, and in Amoria, Ratanpur, Bans, and Rasulpur, Ghous of Gorakhpur.—Elliot. See Chununee.

GARGI VACHAKNAVI, with Sulabha Maitreyi and Vadaya Pratithheyi, are three learned women, mentioned in the Grihya Sutras of the Rig Veda.—Weber. p. 56.

GARYA, son of Baliki. He was a famous teacher and grammarian, and dealt especially with etymology.—Dowson.

GARRH. HIND.

Gad, Ghat, Ghati, Gadi, Ghani, KAR.

A fort, a house, a fortified village; the watch-tower in the centre of a village. See Gar.
GARHA.

GARHA, in the Jubbulpur district, once the capital of the Gond dynasty of Garha Mandla, whose ancient keep, known as the Madan Mahal, still crowns the low granite range along the foot of which the town is built. Tradition gives Garha a great antiquity, and it probably existed from the Christian era.

GARHA. Hind. Very coarse and thin cotton cloth.

GARHEEBUND, properly Garibband, a description of maize tenant in Bundelkhand, by which lands are held on paying a stipulated yearly tribute, but not one-fifth the amount which ought to be paid. The Mahattas found the Garibband holders difficult to deal with in every way, slow and irregular in the payment of revenue.—Elliot, Supp. Gloss.

GARHWAL, in the Himalaya, has a British portion and a Native State. British Garhwal, in the N.W. Provinces, lies between lat. 29° 26' and 31° 5' N., and between long. 78° 17' 15" and 80° 8' E., with an estimated area of 5500 square miles; pop. (1872), 310,288 persons. The valleys of the Giri, Tons, and Pabar rivers, which flow into the Jumna, adjoin the district of Garhwal, in which are deodar forests, and some of kail, Pinus excelsa; while lower down there are forests of chill, Pinus longifolia. The Tons river is under the Garhwal and Dehra Doon authorities; the Pabar and the Giri run through Bassahir and Sirmur respectively. The streams are rapid, and the volume of water scanty. It has a mixed population.

The Dom or Bhum appears to be the descendants of the aboriginal tribes, and now form the menial class throughout the district. The Khasiya evidently came from the plains of Hindustan. The Brahmans and Rajputas arrived in the country after the establishment of a settled government. The great Hindu temples of Badrinath and Kedarnath attract large numbers of pilgrims, and have produced a deep influence on the history and manners of the people. They lie among the inmost recesses of the Snowy Range.

A totally distinct race inhabits the region lying within the Snowy Range. These are the Bhotia, a tribe of Indo-Chinese origin, much intermixed with Hindu elements. They talk the Hunia or Tibetan language, as well as the Hindi, and they have also a patois of their own. They number in all only 3060 souls, but they control the whole carrying trade with Tibet. Both men and women are powerfully built, dirty in their habits, and greatly addicted to drink. Among the social customs of Garhwal generally, must be noticed the universal prevalence of polygamy. Wives are looked upon in the light of beasts of burden, so that every man obtains as many as his means will afford. Desertion and suicide are common, in spite of all the efforts of the British officials in ameliorating the condition of women.

Garhwal or Tehri, the Native State, is in political relationship with the British Indian Government, lying between lat. 30° 2' and 31° 20' N., and between long. 77° 54' and 79° 19' E. The chief town is Tehri. The raja pays no tribute. The area of Garhwal is about 4180 miles; the population in 1875 was estimated at 150,000, and the revenue at £8000. The hills are generally very steep, and a large portion of the territory is covered with forests, which include valuable deodar tracts. These were leased to the British Govern-

ment in 1864. Garhwal is a large extent Bhot; the language spoken is Hindi. The habitable portion of the Bhot area in Kamaon and Garhwal is confined to the passes and their neighbourhood, all the rest being either snow or rock.—Imp. Gaz.

GARI. Hind. A carriage of any kind, from a coach-and-four to a wheel-barrow. The driver is called Garivan, also pronounced Gadi and Gadiwan.

GARI-GOND. Hind. A light substance like the decayed cotyledons of a seed, or decayed soft grains of the pith of wood, very bitter to the taste. The native druggists of India call it a foreign white gum; it is a purgative and given when vision is much obstructed from any cause; one dose with other ingredients is a dose.—Gen. Med. Top. p. 136.

GARJO, a cross with the yak, when sires a bull and dam a yak. See Yakko.

GARLAND.

Garlands are in constant use in India amongst native Christians, Hindus, and Mahomedans, on festive, on religious, and on funeral occasions. They are placed around Hindu idols, over the graves of Mahomedans, at the doors of churches, and are hung around the necks of visitors. This seems to have obtained from the most ancient time, for garlands were made part of the bridal as well as sacrificial ornaments amongst the Greeks. Thus in Agamemnon, Clytemnestra, in addressing Achilles, says:

'Offspring of Thetis, pity my distress';
Success a virgin named, tho' falsely named,
Your bride: yet I with flowers adorned her brow,
And fancied that I led you to her arms,
But now I to the bloody altar lead.'

Iphigenia in Aulis.

Acts xiv. 13 mentions how the priests of Jupiter brought oxen and garlands to offer sacrifice to Paul and Barnabas.—Hind. Theat. ii. p. 68.

GARLIC, Allium sativum.

Garlic is largely used as a condiment by all the Hindu and Mahometan races of India, who consider it a valuable stimulant. It is added to their curries. It is grown all over India from the seed or bulbs, the latter method being most in practice. One of the bulbs is broken, and the cloves taken out and planted in beds about four inches apart. No particular care is required, save watering and keeping clear of weeds. When the leaves dry and wither, then take up the roots and preserve. Garlic oil is obtained by expression from the cloves of the garlic bulb. It is prescribed internally by native practitioners to prevent the recurrence of intermittent fevers, and externally in paralytic and rheumatic affections.—Riddell; Faulkner; M. E. of 1855.

GARM-AB, a hot spring in Jell, which preserves its temperature throughout the year.

GARM-MASALIII. Hind. Spices, warm condiments.
GARNET.

GARNET. Pers., is a term applied to the pasture grounds of the nomad pastoral races of Asia. Every pastoral mountain tribe in the Himalayas, in Tibet, in the Afghan and Baluch mountains, in Arabia, Syria, Persia, and in Kurdistan, has its wintering and summering regions. The province of Fars has its Garnet-sair, also its Sarhad or Sard-sair, its warm and cold climates. The Kashgai are a nomadic Turkish tribe of about 12,000 families, whose chief is the Hi-Khain of Fars. They and the Bakhtiar from the warm pastures of Arabistan and the head of the Persian Gulf, arrive in spring on the plateau of Isfahan. At the approach of winter, both the tribes return northwards to their respective wintering lands. The entire southern region of Fars, bordering on the Persian Gulf, is called the Garnet-sair. It extends from the sea to the latitude of Kazerouen, and runs parallel with the Persian Gulf from the banks of the Tab to the confines of Luristan. From Bushire eastward as far as Cangoon, the tract is named the Dushtistan or land of plains. The Tungistan, commonly pronounced Tungistoon or narrow land, is a small tract of land east of Bushire. The greater portion of the people of the whole Garnet-sair consists of an independent lawless set, many of the tribes being robbers by profession. A huge wall of mountains separates the Garnet-sair or low region from the Sard-sair. Sard-sair signifies the cold region, but it is also termed the Sarhada, a word literally signifying boundary or frontier, but generally applied to any high land where the climate is cold, or the high table-land of Persia. One of the most conspicuous of these is an abrupt lofty hill, named Hormojo, where coal occurs. In Fars, the Garnet-sair of Siijistan is a narrow strip of culturable land about one-fourth of a mile on the south bank of the Helmand, five days' journey N.W. from Nushki, on the edge of the desert. The Baluch races seem to pronounce it Garmseh or Garnet-sair, and one of their wintering places is north-west of Nushki, distant about 75 miles.—Pottinger's Tr. p. 108; Rich.

GARNET.

Hung., ... Chin. Granati, Carbunculus, Lat.
Grenat, ... Fr. Yakut? ... Malay. ... Ganganstein, ... Ger. Sang-i-mahtab, ... Pers. ... Granatstein, ... Gr. Granatnoi-kamen, ... Rus.
Tambr ... Hind. Granadas, ... Sp.
Granate, ... It.

Garnet is a word supposed to be derived from the Greek γαρνέτα, the red byzantia of the Romans. There are many varieties,—Almandine or noble garnet; grossular garnet; cinnamon stone, esotton, hessonite, or kanelle stone; romanzenite, and hyacinth; common lime garnet; magnesia garnet; fire garnet; common iron garnet; rothsfelte, alloclorite; melanite, pyreneite; colophonite; uvarovite; pyropy; almandine, hexahedral garnet; helvine or tetrahedral garnet; and idocrase or pyramidal garnet. The Alabandite carbuncles of Fliny were so called because they were cut and polished at Alabanda. The clear deep-red garnets make a rich stone, and are much used for cameos. The cut is quite thin on account of their deep colour. It is this thin stone which is now termed the carbuncle. Among the Burmese the most beautiful come from Sirian, the chief town of Pegu. Garnets of very good quality occur in Nellore, Masulipatam, and Bezvarraul.

The red variety of the gem is very generally diffused over India. Its geogonic position is the hypogenic or metamorphic schists near their line of junction with plutonic rocks or trap dykes; for instance, in the crystalline and metamorphic areas of Salem and Nellore, whence the finest crystals are procured, and sold by the native merchants at an insignificant price. Colophonite is not uncommon in these tracts, as also in Mysore, the Neighherries, the Karmatic, and other provinces of Southern India. It usually occurs in the granite, associated with the hypogene schists. There are several forms of garnet, as almandine, pyrope, or esottonite and, in the Neighherries near Benza in the hypogene hornblende rock, near the Seven Cairns Hill, where entire portions of the rock are formed almost exclusively of them, the esottonite and hornblende in large separate crystals, embedded in a paste of compact felspar and hornblende; the former is very liable to disintegrate, leaving, in falling out, small cavities in the rock. Green garnet is of rare occurrence. Newbold discovered this in the Salem district at Sankerydrug, about 8 miles S. of Palamnah, in the Hyderabad country, in the doritos of a granite rock, penetrated by trap dykes, and composed of mica, garnet, kyanite, quartz, and felspar. Dr. Voysey states that the precious garnets are found there at the depth of eight or ten feet in the alluvium at the foot of the rock. He found the surface of the rock and soil strewed with garnets in great profusion, but these were generally of a very coarse kind. The garnets when collected are gently powdered, and the bad ones broken; those which survive the blows are reckoned of good quality. In a river near the Munzerabad ghat in Mysore, the natives search for garnets, which are sold at one rupee each. They occur there as deposits from a hill of mica schist which occurs higher up the river, which Captain R. Roberts of the Engineers followed up.

The garnets of China are found in the Lu-shan mountain in Kiang-si, not far from Kia-kang.

There are three distinct kinds of ruby garnets sold in Madras,—1. Sublustranum ravakulu, the best, obtained from a village of that name in the Madura district; 2. Badrachellum ravakulu, second in quality, obtained from Badrachellum on the river Godavery; 3. Kondapilly ravakulu, obtained in the neighbourhood of Kondapilly, Bezvarraul, Toley, Kistna district. Bezvarraul garnets sent to England realize in the market £8 a ton, and Mr. Bowden thinks they are used as a substitute for emery. In Southern India they are almost universally employed by the cutter, the stone-mason, and others, as a substitute for emery, under which name the coarser garnets are sold in the bazaars. In the scale of hardness, the garnet is 6½ to 7½. Garnets are of various colours, a circumstance due to the varying proportions and combinations of the three or four silicates of alumina, lime, iron, and magnesium, or essossite, of which the following are typical:—

GARODI.

GARODI, a race of migratory jugglers, who exhibit serpents; they profess Mahomedanism.

GARO HILLS are in the S.W. corner of the province of Assam, lying between lat. 25° 9' and 26° 1' N., and long. 90° 52' and 91° 3' E. The principal ranges are the Tura and Arbela Hills, which run east and west, some of the Tura peaks rising to 4500 feet. The Garo Hills form a mountainous projection between Goafpara and the Bengal district of Mymensing, and are now a revenue district of British India, with an area of 3186 square miles, and an estimated population of 80,000 or 100,000. They have, like the people of the plains of Assam, been, and are, to a large extent, converted to the Hindu faith; but they consider themselves as forming three or four nationalities, with different names. The most eastern, bordering on the Khassya, are called the Nunya, the central tribe are the Lyntea, and the remainder are the Abengya. Each tribe has its dependent and independent branches. The Nunya resemble the Khassya in feature and complexion and in language. The language of the western Garo is unintelligible to the Nunya. The Bengali people, however, only distinguish the Garo as the Malawa and the Bemalawa, which, like the Bori and Aboor of Upper Assam, means dependent and independent.

The Garo build large houses on the lower hills; the bamboo floor is from four to ten feet from the ground. One corner is enclosed as a bed-room for the parents and girls, who alone stop at home. Every village has its Deka-chang or bachelors' hall, in which all the boys and unmarried men sleep. Several of the petty rajahs of Kamrup, whose estates skirt the Khassya and Garo Hills, are Hinduzied Garo who have maintained their footings in the valley during changes of dynasty. The Garo have many slaves, called Nakola. A freeman, Nakoba, must not marry a slave girl, nor even keep her as a concubine. The men are lively, good-natured, hospitable, frank, and truthful. The young women make the first advances, the newly-married man is taken to the bride's home, and the descent of property is in the female line. The women wear a short kilt. The clans are divided into different houses, called Mahari (Buchanan calls these Chatasbak), which may be translated motherhoods. The man who marries the favorite daughter of the house must also marry her mother on the death of her father, and in this way he succeeds to the family property. Among them and the Khassya, in all domestic matters, the women enjoy a high social position. They never cut the hair of the head.

Cotton is their chief husbandry. They practise the jumia mode of cultivation. Their weapons are swords, spears, bamboo shields. They use sharp bamboo panji or stakes, four inches long, as a means of opposing invasion. They eat omnivorously, kine beef, pork, deer, tigers, dogs, snakes, and frogs, but hold milk in aversion. They rear kine, goats, swine, dogs, cats, fowls, and ducks. They eat dried fish and tortoises, which they buy in the plains; and their hills supply them with deer, wild hogs, frogs, and snakes.

They believe in demons, imps, and witches; they think that the souls of certain persons can leave their human frames and take up their abode in the body of a tiger or other animal. A small dish of bell metal with embossed figures, called a Deo-Kora, is hung up in a household god, and worshipped and sacrificed to; and the Garo believe that when the household are asleep, the Deo, or figure of the Kora, issues in search of food, and returns to its Kora to rest. They burn their dead, and bury the ashes near the door of the hut. At the time of cremation, dogs are sacrificed in order that they may direct the spirit on his way. They sacrificed human beings to their spirits, and to the manes of their chiefs, but in a treaty in 1848 they consented to abstain from hanging human skulls in their houses. A party of them, however, in May 1860, murdered sixteen natives of the plains in the north of the Mainamensing district, and after mixing the blood of the murdered with that of a chief, they carried it off, and three were executed in their own villages before their own people. Their accomplishments, in number some twenty men, were condemned to transportation for various periods. Their object was not so much plunder as human heads to offer to their spirit of the mountains. The raja of Nusa-tung, one of the Khassya states, subsequently undertook to aid in repressing their raids.

The attempt to enumerate them at the census of 1871 disturbed them, and in 1872-73 an expedition had to put them down. The Garo erect carved posts as monuments. The Khassya and the Ho also erect monumental stones.—Buch. Ham. in Linn. Tr. xvii. p. 203; Campbell's Ethnology; Dalton's Ethnology; Indian Antiquity, October 1873; Imp. Gaz.

GAROKEE, a wandering race in Woon.

GARORU of the Ravi, a rope across a stream, by means of which passengers and goods are slung across by a pulley arrangement.

GAR-PAGARRI, a sect of Hindu Sudras, who profess to have the power to prevent the fall of hailstones on fields. Possibly the term is derived from the Persian ghar, ice. Wilson says the word is Maharatta, and that they are retained in some villages as part of the establishment, to prevent the hail injuring the crops.

GARPHANS, officers of justice in Hindes.

GARRAH, a principality on the Nerbadda, bordering on Bundelkand. In the early years of Akbar's reign (A.D. 1564, A.H. 972) it was invaded and conquered by Asaf Khan, an officer of Akbar. It was governed by a queen, who opposed the Mahomedan general in an unsuccessful action, when, seeing her army routed and being herself wounded, she avoided falling into the hands of the enemy by stabbing herself with her dagger. Garrah untried in the middle of the 16th century was 300 miles long and 100 broad. Garrah town is 5 miles below Jubbulpur.—Elphin. p. 439.

GARRAH, often written Gharra, a river of the Punjab; the modern name of the ancient Hyphasis.

GARRAH and Uбрassa, districts in the west of Cutch, in which are the towns of Mhar, Narna, and Laktap Bandur.

GARRULACINE, a sub-family of birds of the tribe Incessores and family Corvide.

GARU. Tel. Literally 'they,' like the German Sie, the honorific plural of the pronoun, it is added to any name as a title of honour; thus Amma-garu, lady mother, is a titular appendix to the names of well-to-do Teling people.
GARUDA.

GARUDA, a demigod of the Hindus, with the head and wings of a bird, and the body, legs, and arms of a man. He is the son of Kasyapa and Vinata, the brother of Aruna, and the vahan or vehicle of Vishnu.

'When high on eagle-plumes he rides.'

As Aruna, the charioteer of Surya (the sun), is the dawn, the harbinger of day, so does Garuda, the younger brother, follow as its perfect light. He is the emblem of strength and swiftmess, and besides being the bearer of the omnipotent Vishnu, is greatly distinguished in Hindu legends on many very important occasions. Aruna, in the Sabean system of the Veda, as the charioteer of the sun, driving his six-horsed car, corresponds with the Aurora of the Greeks. The emblem or vahan of Vishnu is Garuda, or the eagle; and the Sun-god, both of the Egyptians and Hindus, is typified with this bird's head. It is the analogue of the eagle of Jove. Aruna (the dawn), in Hindu mythology, also the son of Kasyapa and Vinata, is the brother of Garuda, and is described as a handsome youth without thighs or legs. His two sons, Sumpati and Jutayo, attempting in imitation of their father to reach the sun, the wings of the former were burnt, and he fell to the earth. Of this the Greeks may have made their fable of Icarus. The images of Garuda are set up and worshipped with those of Vishnu, in the temples dedicated to that deity. Sculptured images of him are also found in the magnificent cavern temples of Elephant, Ellora, etc. In the last mentioned he is in several places accompanying Parvati, the consort of Siva. Garuda has many names. He is called Suparna from the beauty of his eye; Sumpati, or the enemy of serpents; Vishnu ratha, or the vahan of Vishnu, etc. In many of the vaishnava temples, Garuda is sculptured on the pillars, or large plaster figures are placed at each corner of the temple walls; also on the walls of many vaishnava temples as a winged young man, kneeling or seated, with the palms of the hands closed, and fingers pointing upwards, denoting reverence.—Moor; Cole; Myth. Hind. p. 374; Tod's Travels; Taylor's MacKenzie MSS.

GARUDA-BASIVI, a devoted Murli or Devadan woman.

GARUGA PINNATA. Roxb.

Toom, . . . . BENG. | Karri-vemulu maram, TAM.
Khyong-yowk, . . BURM. | Garuga chettu, . . . Tel.
Kuruk, Kanghur, . . HRV. | Kaluguda, . . .
Khar pat, . . . PZAR.

A large tree with a round unbranched head; leaves pinnate, deciduous; flowers of a yellowish white, spirally arranged, covered with a mealy kind of white substance; fruit-size of a small plum, used for pickling. Grows in the Madras and Bengal Presidencies and Punjab; is common in the Bombay jungles and in the plains and on the hills of British Burmah, but the wood is not much used. The bark is a tan; fruit is eaten raw and pickled. —Riddell; Wight; Gibson; Brandis; Stewart; Belldome; Cal. Cat. Ex. 1862.

GARUKI, a town in the Hormara district, a sterile province, subject to Las. The Gujar tribe occupy Jab-Malan. Garuki is occupied by the Sangur tribe; and at Hormara in Mekran, with 400 houses, is a tribe of this name. The Hormara tribe say they came originally from Sind.

GARWA, a tribe of Monghir, who spear otters and the porpoise of the Ganges.

GASPAR ISLAND, or Pulo Glossa, in lat. 2° 24' S., long. 107° 5' E., and 14 miles E. from Batavia; has on it a peaked hill, visible for 30 miles, and is a principal mark in sailing to or from the Gaspar Strait. Gaspar Strait, between the islands of Banca and Billiton, was named after a Spanish captain who passed through it from Manilla in 1724. Many navigators prefer this strait to that of Banca.—Horsburgh.

GASTEROPODA, the third class of molluscs; according to the system of Cuvier, it is very numerous, and an idea may be formed of it from the slugs and shell snakes. According to other classifications, it is the second class.

GASTEROSTEIDÆ, a family of fishes of the order Acanthopterygi. Gasterosteus dactylus is the pilot fish.

GASTROCHENIDÆ, a family of molluscs, comprising the genera Gastrochena, Clava-gella, and Aspergillum.

GASTRODIA SESAMOIDES, R. Br. A herbaceous species of orchis, native of New Holland. It is edible, and preferred by the aborigines to potatoes and other tuberous roots, and should be introduced into India. It flourishes in its wild state on loamy soil, in low or sloping grounds, and in the spring appears as a whitish bulb above the sward, of a hemispherical shape, and about the size of a small egg. The dusky white covering resembles a fine white net, and within it is a pellicul gelatinous substance. Again within this is a firm kernel, about as large as a Spanish nut, and from this a fine fibrous root descends into the soil. It is known in Van Diemen's Land and Australia by the name of native bread, also wild yam.—Simmonds.

GATA. HIND. (1) A plot or piece of land; (2) two bullocks in yoke treading out the grain; (3) a Brahman or Banya associating with a strange woman.

GATE. The gates of Eastern cities with Mohomedans have honourable names, such as the Dehi gate, the Mecca, etc., gates. In British India, natives lower their umbrellas when passing through the gates of a fortress. In China, the south gate is always honoured, and the dead and night soil are not permitted to be borne through it.

GATHA, a song; a verse; a religious verse, but not taken from the Vedas. The Zend hymns of the Zoroastrians (Zarathustra) are called Gathas. The verses interpolated in the Sanskrit Buddhist work called Lalita Vistara, are composed in a dialect between the Sanskrit and the Prakrit, and have given their name to this, the Gatha dialect.—Dowson.

GAT-HA, properly Gatha, a measure of length. The twentieth part of a jareeb. Each Gat-ha contains three Ilahi gas. The word is derived from Gat-hna, to join or unite by knots, from Gandh, a knot.—Elliot, Supp. Gloss.

GATTARU, an out-caste race in Ceylon.

GAU. SANSK. The German Gau, Armenian Gavar, earth, land, province. It was also a settlement of the Aryans near Sogdiana.

GAUDA. KARN. An agricultural tribe in Mysore, sometimes labourers; small farmers under a lease from the landlords. A grain store. Tel., a bricklayer race of Hindus.

GAUDA. KARN. The headman of a village, similar to the pottai of the Mahratta villages; also
the headman of the potter, shepherd, cowherd, weaver, and cultivator castes. — W.

GAUDA-PALEN, a Buddhist temple at Paghman. Gauda-Palen signifies the throne of Gaudama. Height, 180 feet. It is cruciform in plan. It is very conspicuous in approaching Paghman from the southward, with numerous pinnacles and tall central spires; it is seen glinting with its white stucco-like plaster for days down the Rawalpindi river, rising like a dim vision of Milan cathedral. It is compact in structure, and elevated in proportion to its bulk. It has a massive basement, with porches, and rising above in a pyramidal gradation of terraces, crowned by a spire. From the top of the terrace, just below the spire, is a fine prospect of a vast field of ruined temples, stretching north-east and south-west.

GAUHATI (Gowhatty), chief town of Kamrup district, and the largest in Assam; situated on the left or south bank of the Brahmaputra, in lat. 26° 11' N., and long. 91° 48' E.; population (1872). 11,492. Gaihat is an important centre of river trade, being one of the largest seats of commerce in Assam.— Imp. Gaz.

GAULI, a milkman; tall, robust, and fair race of the Peninsula of India; have no resemblance to any other race in the Dekhan. The name is evidently from Gula, Sansk., Gr., milk. They are pastoral and migratory. The name is also derived from Gopala. Gauliq a migratory pastoral tribe of Maharashtra, who reared buffaloes, sold milk and ghi, and accompany camp.— Wilson.

GAULTHERIA NUMMULARIA, and several other plants which extend into the N.W. Himalaya, are also found in the Javanese mountains nearly 3000 miles' distance. Gaultheria occurs along the whole Himalayan range and in the Khasya, and many other Java plants are more uniformly spread over the hilly districts of India and Ceylon. G. fragrantissima and G. trichophylla also occur in the Himalaya, but are represented by a few species in the plains of the Panjab, on the outer slopes of the Western Himalaya, and even on the Khasya mountains. Spiraea Kambatschatica, camocherdofila, and sorbifolia, and Paris polypylla, are other Siberian forms which extend into the rainy Himalaya, and Corydalis Sibirica and Nymphaea punila are remarkable instances of specific identity between Khasya and Siberian plants.—Hooker.

GAUNHARIN. Hinta. From Gana, to sing. Singing and dancing women of Hindustan in the N.W. Provinces. They perform at all Hindu festivities, at households, play on the saringi (violin), and tablah (drum); their dancing is a posturing. They are like the bayaderes of medieval Europe, and are by profession immoral. They form a very numerous class in all towns and cities in India.

GAUPAYANA, sons or descendants of Gopa. They were the authors of four remarkable hymns in the Rig Veda, which have been translated by Max Muller.—Jo. R. A. S. ii. 1866.

GAUR, the bison of Bengal sportsmen. See Gavrus.

GAUR, a province north of Ghazni, which gave the Gori dynasty to India. It and Balkh are separated from the Seistan by the Paropamisus chain. See Gour.

GAUR, the ancient name of Central Bengal, and of its capital, the ruins of which are still so called. Gaur is mentioned in the Mahabharata, and in historical documents of the 9th century A.D. It was conquered in A.D. 1204 by the Mahomedans, who retained it as the chief seat of their power in Bengal for more than three centuries. It is in the Maldah district, situated on a deserted channel of the Ganges. The city with its suburbs covered an area variously estimated at from 20 to 30 square miles. The west side of the city was throughout washed by the river stream. Here is situated the large Sagar Dighi, the most celebrated artificial piece of water in Bengal. Gaur ruins have been a quarry, not only for the brick houses of the neighbouring towns and villages, but also for the mosques, palaces, public monuments, of Murshidabad. It is now entirely deserted, and overgrown with dense jungle, except where cultivation is again gradually spreading.— Imp. Gaz.; Elphin.

GAUR, a term applied by modern philologists to a class of languages relations to Hindi. Dr. Caldwell, in his Comparative Grammar, remarks that by the term Gaur or Gauda are meant the Bhasha or Prakrit or vernacular tongues spoken in Northern India, some old ones of which have since ceased to be spoken, or have merged into others. At present the languages which may be considered Gauras are, Bengali, Hindi, with its neighbour the Hindustani, Panjabi, Gujarati, Mahrati, the languages of Kashmir and Nepal, altogether nine in number. —Gaur is a designation of one of the two great divisions of the Brahmanas or the five Gaurs, also to one of the five, the Brahmanas of Bengal proper, who are distinguished again as Varendra, Raybaha, Satshati, and Vaidika Brahmanas. The two first, from their being settled in the several portions of Gaur, called Varendra and Rash; the third, as descended from 700 brahmanical families who were settled in Bengal before the introduction of the families from Kanouj, who are said to have been fugitives from Orissa; the fourth, from their knowledge of the Vedas. The Gaur Brahmanas were also classed by Balal Sen, a raja of Bengal about the eleventh century, in three divisions, viz. Kulina, from Kula, a family, the most respectable members of the community; Srotriya, those who had passed through the established institutions, and had read part of the Vedas; and Vansaja, merely born Brahman, possessing neither respectability nor learning.

There are other divisions of Bengal Brahmanas of a still inferior description, degraded by acting as priests for the mixed castes, or by some peculiarities of a fanatical and fabulous character. A Gaur Brahman is one of the five Gaurs now located in Hindustan, in the Upper Provinces, throughout the Subah of Delhi to the hills. There are many subdivisions of these Gaur Brahmanas, who are apparently unknown in Bengal, as the Adh Gaur, Kithal Gaur, Gujar Gaur, Sidh Gaur, and amounting in all to forty-two.

The Gaur Kayasth is one of the twelve divisions of the Kayastha tribe, who are generally clerks, who are all over India, many being in the Upper Provinces, where they settled under the patronage of Nasir-ud-Din, son of Balb, about the 13th century.

Gaur Rajput, one of the 36 royal Rajput races, whose origin is doubtful; they are numerous in the N.W. Provinces, divided into three principal
branches.—the Bhat Gaur, the Brahman Gaur, and Chamur Gaur,—names derived, Mr. Elliot supposes, from some intercourse with Bhats, Brahmins, and Chamaras.

Gaur-taga is an important tribe of Brahmanical descent in the north-west of India, extending through a great part of Rohilkhand, the Upper Doab, and territory of Delhi. They claim to have been originally invited from Bengal by Raja Janaamejaya, king of Hustainapur, for the purpose of exterminating the Takshaka or Snake race, in concert with the raja. Mr. Elliot considers the Takshaka to have been Buddhist Seythians from the north, who invaded India. The Taga have their name, it is said, from the Sanskrit Tyanga, abandoning, as they abandoned their Brahmanical character, by accepting and cultivating the lands granted to them by Janaamejaya.—Wilson.

GAURI, a name of Parvati, the consort of Siva.

In Rajputana, under the name Gangauri, a festival is held in her name. Colonel Tod remarks that by the prefix of Ganga (the river) to Gauri, the Gangauri festival is evidently one essentially sacred to a river goddess, affirming proof of the common origin of the rites of the Iis of Egypt and India; for Gauri is the goddess of abundance, and is called Isis, also Isani or Parvati, also Lakshmi, and corresponds to the Ceres of Greece. The festival relates to the Bassant or spring, the vernal equinox. An image is made of earth, barley is sown, and by watering and artificial heat is made to grow. In Rajputana beautiful girls carry the idol and bathe it in the water, and return with it to the palace. The festival resembles that of the Egyptians in the time of Pharaoh, and of Irath Burius, within the Delta of the Nile. During this festival Iswara yields to his consort Gauri, and occupies an unimportant position near her at the water's edge, meanly clad, smoking intoxicating herbs, and holding the stalk of an onion in full blossom as a mace or club, a plant regarded by some of the Egyptians with veneration, but held by the Hindus generally in detestation; but why the Hindus should on such an occasion thus degrade Iswara, is not apparent.

Gauri Sankar, in Hinduism, is the term usually given to the idol of Siva or Mahadeva and Parvati, in which she is sculptured sitting on Mahadeva's knees, with the bull Nandi at his feet, and the Sinha or lion at her. —Tod's Rajotdhan, i. p. 575.

GAUKUND, in lat. 30° 56' N., long. 79° 3' E., in Garhwal, is on the right bank of the Mandargi, below Kodaranna. The heights above the sea are,—hot springs, 6417 feet; upper limit of walnut, 8116 feet; upper limit of chestnuts, 10,016 feet; upper limit of kanchua, 10,559 feet. —Robert Schlagwteit.

GAURI-SANKAR, a Hindu idol, in which the god Siva is represented in a sitting posture, with Parvati seated on his knee, the bull Nandi at his feet, and the Sinha or lion at her. —Tod's Rajotdhan.

GAURI SANKAR, the Nepalese name of a mountain in the Himalaya of Nepal, in lat. 27° 39' 17" N., and long. 86° 54' 40" E., attaining a height of 29,000 feet above the sea; it is also called Mount Everest, and in Tibetan, Chin-gopa-ma-ri. It is on the Nepal and Tibet frontier, and is the highest mountain of our globe as yet measured. The Hindu name is from Gauri, white or fair, a name of Parvati, the wife of Siva; and Sankar or Sankara, one of the forms assumed by Siva. Gauri Sankar is the term in use among the Hindu pandits of Nepal; its signification shows a remarkable identity with the meaning of the name Chamalhari, the prominent object of western Bhutan. The name given to Gauri Sankar by the Tibetans, and that by which it is generally known in the northernmost parts of Nepal, is Chin-gopa-ma-ri.

GAUR-THAKUR, a tribe of Rajputs settled in the Farakhabad district.—Wilson.

GAURUA, an inferior class of Rajputs in Agra and Mathura, and other districts west of the Jamuna.—Wilson.

GAUTAM. HIND. A branch of the Chandra-vars, or Lunar family of Rajputs, very numerous to the Lower Doab, and formerly very powerful. Offshoots from them, termed Gautaman, are settled in Azimgarh.—Wilson.

GAUTAMA or Gaudama is the name by which the last Buddha, Sakya Sinha, is known to the southern Buddhists. They believe that before coming as Gautama, he had passed through 550 different phases of existence, called dātā by the Burmese. The history of these 550 existences is related in the Jataka, in stories or tales supposed to have been related by Gautama himself to his disciples and others, to make them acquainted with what had happened to him during these metempsychoses. Almost all end by showing Gautama as the hero or principal personage, and that those who had befriended him were now around him as his disciples, whilst his former opponents were now the wicked Dėwadāt and heretics. Most statues represent him sitting cross-legged, the right hand upon the lap, and the other hanging over the right knee. It is the attitude of teaching. Other statues represent him recumbent on the right side, with the left leg placed directly over the right, the head resting on the palm of the right hand, supported by the elbow, and the left arm extended at length over the left leg. This is the position he is described to have assumed when he died.

Images of Buddha Gaudama are largely manufactured in Burmah, in marble, wood, stone, and metals. At Amarapura is a sitting brass figure 12 feet high. It was formerly the tutelary saint of Arakan, and was carried off from thence a.d. 1784, by the king of Burmah.—Fyotich, ii. pp. 14-15. 1181.

GAUTAMA, also written Gaudama and Gotama, in the mythical legends of Hinduism, the father of Kripa; also one of the seven Rishi. Gautama son of Gotama, is a name of the sage Saradwat; but many men have borne this name. One Gautama was the founder of the Nyaya school of philosophy, and Gautama Siddartha is a name of Gautama Buddha. See Buddha; Sakya.

J'hong-nua, | ARAKAN. Methana., | KOCH'H.
Gobay goru, | BENG. Mi-than. | 
Nune, | BURM. Shial. | 
Gavai, Gavai, | HIND. Gau-jangli. | PERS.

Found in the hilly tracts to the E. of the Brahmaputra, and at the head of the valley of Assam, the Mishmi Hills and their vicinity, probably extending north and east into China. It is a heavy, clumsy-looking animal; it has a small distinct dewlap. It is easily domesticated, and has bred with the common Indian cattle. —Jerdon.
GAYA.

GAYA. Jordon. Bishon. Bos gaurus, H. Smith. \[ B. assel, Hor.\] B. gaur. Trullis. Bibles cavifrons, Hodg. Gym. 1185 from in and animals, the of the remained durbcd, shoulder cent Saad-ben-AVakas, valley, some it badda, foot buffalo, Gour, Gaur-Gai, HIND. Katn Yeni, TAM. The gaur, called by sportmen bison and jungle buffalo, is an inhabitant of all the large forests of British India, from near Cape Comorin to the foot of the Himalaya. It is abundant along the Syhadri range or Western Ghats, both in the forests at the foot of the hills, but more especially in the upland forests. The Aminally Hills, the Neighberries, Wynad, Coorg, the Sabu Boolen Hills, and the Mahabaleshwar Hills, are all its favourite haunts. It dwells in the forests of the Tapti river and neighbourhood, and north of the Ner-badda, a few in the deeper recesses of the Vindhyah mountains. On the eastern side of the Peninsula it is found in the Putney and Dindigul Hills, the Shanda Mangam range, the Shoverly Hills, and some of the hill ranges near Vellore and the borders of Mysore; from the Kistna and Godavery rivers all along the Eastern Ghats to near Cuttack and Midnapur, extending far into Central India, and northwards towards the edge of the great plateau which terminates south of the Gangetic valley.—Hodgson also says the Himalayan Terai. It extends into Burma and the Malay Peninsula, and formerly existed in Ceylon. It is a magnificent animal, in length 9½ to 10 feet, height at the shoulder 6 feet, tail 31 inches. They associate in herds of up to 30 or 40, generally 15 cows and a bull. It is one of the most timid and wary of animals, and requires to be stalked most warily and carefully. It breeds in the cold season, and the young are born June to October. When disturbed, the first who sees the intruder stamps with its foot, and the whole rush through the forest with a terrible crash. All attempts at domestici-antakking them have failed.—Jordon, pp. 302-6.

GAYA.

Bos banteng, Rugles. | Bos soniacaens, Mütter. B. leucoprymnus, Q. and Q. B. taoing, BURM. | Bant-teng, MALAY. The Burmes wild ox or wild cow is a native of the Malay Peninsula, Martaban, Java, Borneo, and Bali, but is not in Sumatra, Celebes, or any of the Philippine Islands. Another wild ox, called Saladang by the Malay, seems to occur along with it. GAEVH, a Persian standard. This famous standard was a blacksmith apron set in jewels, and was long the imperial standard of Persia. Gaveh was a blacksmith, who overthrew Zohak, and placed Yendoon on the throne of Persia. When collecting followers, he carried his apron as the standard of revolt against Zohak. This apron remained the standard of the empire, till taken by Saud-beu-Wakas, who commanded the Mahomedan army that conquered Persia.

GAVEL-KIND. Eng. The equal division of the inheritance amongst the sons. It was brought to England by the Jut brothers who settled in Kent. It was the custom of the Getic hordes, and is still followed by the Jharja Rajputs.

GAVIAL, the genus of crocodiles described as Gavialis, properly the gharial; has jaws very long, sub-cylindrical, slender, rather dilated, and convex at the end. Teeth, canines two, quite anterior, small; lower canines shutting into a notch in the edge of the upper jaw; feet fringed; toes webbed to the tip. The cervical plates united to and forming a disc with the dorsal ones. Males with a large swelling in front of the nostrils. See Crocodile; Gharial.

GAYA. SANSK. Five products of the cow, milk and its preparations; in Hindisism, the pancha gavya are proper offerings to an ancestor's manes.

GAWILGARH HILL, RANGE, a branch of the Satpura mountains in Berar, situated between lat. 21° 10' and 21° 46' 30" N., and between long. 76° 40' and 77° 53' E.

Gawilgarh Hill Fortress is about 21 miles N.W. from Ellichpur, in lat. 21° 21' 30" N., and long. 77° 24' 30" E. It was taken by storm on the 15th December 1803. The Gawilgarh Hills rise in peaks to heights of 3000 feet. They are 120 miles long, and 60 miles broad. They commence at the confluence of the Purna and Tapti rivers, and the confluence nearly E. by N., terminate a short distance beyond the sources of the Tapti and Wardah, separating the Tapti and Purna rivers. To the south they are bounded by the valley of Berar, and to the north by the course of the Tapti. It was first fortified by the Gaoli, a tribe from whom it takes its name, and who are still numerous here. The fort, 2300 feet above the plain, and 3595 above the level of the sea, is quite in a dilapidated state, and the only interesting object now remaining is the old mosque, completely in ruins, many of its twenty-one domes having fallen in, and the surrounding walls given way. A tablet over the gateway records that this building alone cost within a few piece that of the whole fort. A gun on the fortress is 27 feet long: Colonel Stevenson in 1803 brought his guns up via Dhamungoa and Amjura, and his brigade of the army under the command of General Wellesley took Gawilgarh.

GAYA, a town in Bengal, lat. 24° 48' 44" N., and long. 85° 2' 16" E., on the right bank of the river Phalga; it has a population of 66,843, and is the chief town of a British revenue district of the same name. It is in two portions, —the old town, or Gaya proper, where the priests reside, and Sahibgunj, the trading quarter. As a place of Hindu pilgrimage, the town of Gaya is of comparatively modern interest.

Buddha or Bodh Gaya is about six miles south of Gaya; and a few hundred yards west of the Phalgu or Nilajaen river there are ruins of great sanctity. Sakyu Sinha, the founder of the Buddhist religion, dwelt here, and here is the pippal tree under which he sat in mental abstraction for five years. The tree is still here, but is much decayed, being at least 2400 years old. Immediately to the east of the tree there is a massive brick temple, nearly 50 feet square at base, and 160 feet in height. This is beyond all doubt the vihar that was seen by Hiwen Thang in the 7th century, as he places it to the east of the Bodh tree, and describes it as 20 paces square at base, and from 160 to 170 feet in height. At the present day the chief pilgrims to the sacred tree at Bodh Gaya are devout Maharratas. Before leaving his home, he must first walk five times round his native village, calling upon the souls of his ancestors to accompany him on his journey. Of the 45 sacred places, Bodh tirtha or tirtha is supposed to represent the footprint of
some deity. At each a pinda or ball of rice and water has to be deposited by the pilgrim, while a hymn is chanted by the attendant Brahman. The Brahman tribe are called Gayawal, and obtain large sums for conducting the pilgrims to the shrines. Gayase widows are barred the privilege of wiving after the death of their first wife, as Hindu widows are barred the privilege of taking a husband after the death of their first husband. This may be a remnant of the celibacy of the Buddhist priests.

There are also extensive remains of temples and monuments, and of the Rajasthan or palace, said to be the residence of Dharma Asoka and some of his successors on the throne of Magadha. Another place of interest in the district is a temple of great antiquity, which crowns the highest peak of the Barabar Hills. This temple is sacred to Sidheswara, and contains a linga said to have been placed there by Bara Raja, the king of Wajjar. In September, a large fair, attended only by men, is held here. The pilgrims, who number between 10,000 and 20,000, spend a night on the mountain. Near the foot of the hill are some caves cut in the rock, about 200 years b.c., and in the immediate neighbourhood are a sacred spring and tank, and several sculptures of great interest to the antiquary.—Cunningham, _Ancient Geog. of India_, p. 459; _Tr. of Ind._, p. 223; _Imp. Gaz._; _Arch. Surv. Report_, xxxii.; _Beng. As. Soc. Journ._, 1864.

GAYASHA, the tea-house girl of Japan. They are virtuous. It is part of their profession to assist at the orgies of the Pans and nymphs.—_Hodgson's Nagasaki_, p. 240.

GAYATRI. From the Sanskrit Gay, to sing, an invocation used by Hindus as a prayer. That usually alluded to under this term is considered to be the most sacred verse in the Vedas. In the nature-worship of the Vedas, the sun was worshipped under the designation Savitri. This prayer is supposed to be known to Brahman only. They are taught it when they receive the sacred string, and they are enjoined never to communicate it to any other sect. Its Sanskrit words are,—O'm! Bhur bhuvah svah, O'm! Tatas vithru varmanam, Bhargo devyasa dhimahi diyo yona pra do dayath. O'm! earth, air, heaven, O'm! 'Let us meditate on the supreme splendour of the divine Sun. May he illuminate our minds.' Professor Wilson's literal translation of it is: 'We meditate on that desirable light of the divine Savitri (the sun) who influences our holy rites.' Sir William Jones, Colebrooke, Wilson, and Benfer have each given into the English version of this portion, all somewhat differing. The Gayatry, called by Sir William Jones the mother of the Vedas, and in another place the holiest text of the Vedas, is expressed by the triliteral monosyllable AUM. Sir William Jones thus interprets it: 'Let us adore the supremacy of that divine Sun, the godhead who illumines all, delights all, from whom all proceed, to whom all must return, whom we invoke to direct our understandings aright in our progress towards his holy seat.' And in another place he defines that divine Sun as 'not the visible material sun, but that divine and incomparably greater light which illumines all, delights all, from whom all proceed, to which all must return, and which can alone irradiate our visual organs merely, but our souls and our intellects.' Mr. Colebrooke again thus explains it: 'On that effulgent power which is Brahman himself, and is called the light of the radiant sun, do I meditate, governed by the mysterious light which resides within me for the purpose of thought. I myself am an irradiated manifestation of the supreme Brahman.' These are, however, mere scholastic or theological comments; to suit the theological doctrines of the various Hindu sects, for there is no doubt that the Vedic doctrine was a nature-worship, and the quoted Sanskrit words are an invocation to the sun. Gayatri is a form of metre, and thence applied to this verse in the Vedas, which is repeated inaudibly in the daily morning worship of the Brahmans. Bunsen thus interprets it:—

'Ve remember with longing the bright beams of the sun.
May he prosper the handiwork of our piety!
For sustenance we supplicate the divine Producer:
That he may deign to bestow on us our portion, do we beseech him.
All, with heart and soul, adore God the Begetter,
Bringing him offerings of a devout heart, with hymns of praise.'

The extreme importance that the Hindus attach to the supposed profundity of the Gayatry, renders it a text of more curiosity than readers will be able to discover in the words themselves, in either their ordinary or recondite allusions. Sir William Jones says that the Gayatry is called the 'mother of the Vedas.'

GAYAWAL, a class of Brahmanas at Gaya, who claim the right of conducting the ceremonies of pilgrims at the Ghats, and of fees.—W.

GAYFER, MALAY. A fruit of Singapore. Its seeds are used as marbles.

GAYNI or Gajni, an ancient name of Cambay, now in ruins, and 3 miles from the present city.

GAZ or Gazu, which is much used for making sweetmeats in Persia, is a glutinous substance like honey, deposited by a small green insect upon the leaves of the tamarisk tree. It is the manna of the chemist, Gazanjab, and is the manna produced on branches of the Tamarix indica, to distinguish it from Turanjabin, Persian manna, from the Shirkist or Khorasan manna, and from Sicilian manna.

GAZ. HIND. A long measure, formerly varying in length from 18 to 58 inches, but reduced by Akbar to a standard supposed of 33 inches, and called the Shali-gaz. The gaz of Gujarat is 27¼ inches.

GAZA, a town in Syria, with a harbour and a castle. It contains many monuments. The principal commerce is furnished by the caravan between Egypt and Syria. Long. 34° 45' E., Lat. 31° 24' N.—_Robinson's Tr._, p. 23; _Eothen._

GAZELLE, the name given to several species of the family Bovidae and sub-family Antilopinae, under which they have been noticed,—the Indian, G. Bennettii; the Persian, G. sub-gutturosus; and Arabian, G. dorcas. The Indian gazelle is found in India, and is known to sportman as the goat-antelope, or ravinie deer. The species to which no doubt Moore's celebrated lines were addressed, is the Dorcas gazelle of Arabia and Northern Africa, which is often kept in a semi-domestic state by the wandering Arabs, and makes a most
GECKO.

In the city of Lhassa, and over the whole of Tibet, Geawa Remboochi, or the Grand Lama, is nominally the supreme authority in temporal and spiritual affairs. His residence is in Pattho Goompa, on the north side of Lhassa.

GEBANTE, also known as the Catabeni, an ancient race who occupied the country immediately within the Straits of Babul-Mandab. Their seaport was Okelia, which was long the centre of commerce between Europe and the East. Its ruins are situated about a mile inside the straits, at a place called by the natives Dakoo. See Okelia.

GEBIE, an island between N. Guinea and Gilolo, in the Eastern Archipelago, and not far from Gilolo. It is occupied by a Negro race, with nose flat, the lips thick and projecting, the complexion a dark olive, the eyes deep-seated, and, on an average, the facial angle 77°, but as high as 81°. In Gebbe and Waiguy, and in some parts of the coast of N. Guinea, the complexion is lighter, and the peculiar texture of the Negro hair is absent. M. Freycinet has described the Negroes of Gebbo. In Gebbe, Waiguy, and in some parts also of the coast of New Guinea, the Malay race may have become intermixed with the Negro, as the complexion is lighter, and the peculiar texture of the Negro hair absent or obliterated. The language spoken by Waiguy is entirely Papuan, being that which is used on all the coasts of Mysol, Salvatty, the N.W. of Guinea, and the islands in the great Geylvin Bay. Waiguy, Gebe, Poppa, Obi, Batchian, between New Guinea and the Moluccas, as well as the south and east peninsulas of Gilolo, possess no original tribes, but are inhabited by people who are evidently mongrels and wanderers.—Wallace, ii. p. 216.

GEBl DUKHUN. Its porphyry quarries, the Mons Porphyritus of the Romans, are probably coeval with the celebrated Breccia quarries of Wadi Keny, and worked in the time of the first Oser-teson, the supposed Pharaoh who ruled over Egypt in the time of Joseph. The beautifully coloured porphyries, green, purple, and red, and much of the basalt used in ancient Egyptian sculpture, were derived in great measure from Gebl Dukhun and its vicinity. The Wadi from Gebl Dukhun to Keny, the ancient Kopiopolis, a little north of Coptos, is to this day called the Tarikat-el-Arabiyeh, the high road of the carts. An inscription on the frieze of the temple near Gebl Dukhun, bears the name of the emperor Adrian, with the surname of Trajan, whose son by adoption he was. The temple is dedicated to Sempis the Great, with his titles of Pluto and the Sun, and the other gods in the same temple. Small temples to Scorpis are very common in the vicinity of the mines and quarries, as Pluto is supposed to preside over demons and the evil genii, who, the orientals imagine, watch over the treasures in the earth. Gebl Dukhun lies in about lat. 27° 16' N., and long. 33° 3' E. There is an ancient road leading from it to Myos Hormus, an old port on the Red Sea, from which it is distant about 39 miles as the crow flies.—The Eastern Desert of Egypt, by Hekekanby Bay.

GECARCINUS, a genus of land-crabs, called by the French Tourlouroux, Crabes points, and Crabes violets. G. carinex and G. hirtipes occur in India, G. carinex in the neighbourhood of Pondicherry; its carapace is very much elevated.

GECKO, a genus of saurian reptiles of the widely distributed natural family Gekotidae. In the Malay tongue they are called Tokke or Tokai. In Burma, the ordinary call of the house Gecko is Toottay. In the forests, large flat and marbel-coloured Geckos cling to the smooth trunks of the trees. Their cries are a soft clear call and their hideous forms alarm strangers. It is said a French traveller, M. Touquet, hearing his name pronounced, repeatedly answered to it, 'Eh bien,' until made aware that it was the Gecko's call.

There are in Ceylon Hemidactylus maculatus, Dum. et Bib., H. Lescenhauti, Dum. et Bib., H. frena tus, Schlegel. The last named is very common in the houses of Colombo. Colour grey; sides with small granules; thumb short; chin-shields four; tail rounded, with a transverse series of small spines; femoral and frontal pores in a continuus line. The Geckos frequent the sitting rooms, and, being furnished with pads to each toe, they are enabled to ascend perpendicular walls, and adhere to glass and ceilings. The Tokai or Takke of the Malays, le Gecko de Siam of Cuvier, are numerous in Siam, but also occur in Java and other places of the Archipelago. One is from 6 to 8 inches long, and marked with red and green spots under the tubercles. They destroy multitudes of noxious insects.

Gecko verus, Aene., Bengal, Assam, Andamans, Tenasserim.

G. stenotus, Cantor, Andamans, and six others.

Physochon homalocephalum, D. and B., Pegu.
H. Kelzari, Ceylon, Singapore.
H. maculatus, D. and B., Ceylon.
H. sublavia, Grey, Mergui, Ceylon.
H. fasciatus, Grey, Ceylon.
H. frenatus, Grey, Ceylon.
H. vittatus, Ceylon, and three others.
Peripia Cantorii, D. and B., Andamans.
Nysterium platyrurus, Schlegel.
Uperia, Born of Bengal, Ceylon.
Pseusma cepedianum, Per., Mauritius.
F. Andamanensis, Bleth, Andamans.
Gymnodactylus Jerdonii, Theob.
G. Geckohides, Spix, Salt Range.
G. friedrixis, Grey, Ceylon.
G. pulchrellus, Grey, Penang, Singapore.
G. frenatus, Gunth., Ceylon.
G. Kandianus, Kelaart, Ceylon.
G. Mysorensis, Jerdon, Bangalore.
G. Indicus, Grey, Nilgherries.
G. Malabaricus, Jerdon, Malacca.
G. littoralis, Jerdon, Malacca.
G. Decanensis, Sikes, Dekhan.
Nanellus variegatus, Bleth, Tenasserim.
N. fasciatus, Bleth, Sabah.
Puellula rubida, Bleth, Andamans.
Euhæpharhis Haridwirkii, Chaiassa, Chattagong, and
F. macularis, Blyth, Salt Range.
Homoena fasciata, Blyth, Central India.
Platyrurus Schneiderianus, Java.
Boltalía subleavis, India.
Peropus mutitius, Manila.
Theconyx Seychellensis, Seychelles.
Pentaleucythus Duvancéllii, Calcutta, India.
Tarentola Borneensis, Borneo.
Goniolactys Timorensis, India, Timor.
Cytodactylus marmoratus, Java, Philippines.
P. pulchellus, Singapore.
Heteronota Kendallii, Borneo.

—Crawford's Embassy; Tennant's Ceylon, p. 281; Giovanni's Natural History, p. 31; Gray, Lizards, p. 155.

GEDAUN, in Baluchistan, the tent of black felt in which families reside. The Afghans call it Kizlud; the Turks, Kara Ulli; and the Persians, Sinh Chadr. The felt is the Nanadah of India, from which is the Indo-European word Nomade.

GEDROSIA of the Greeks, the modern Makran. See Kej.

GEER, a tract in the south of the Gujarat peninsula, stretching 50 miles east and west, and 30 miles north and south. It consists of ridges and hills covered with dense forest trees and jungles, and full of almost inaccessible fastnesses, which for ages gave shelter to robbers, outlaws, and the Aghori fanatics, said to be cannibals. Lions, till lately, were found in the Geer jungles, but there are no tigers. The climate is equable and temperate, and the coast is balmy with the wet breezes blowing fresh from the south pole.

—Col. Rev., December 1860. See Kattyawar.

GEESOO. The Koutoutkow, Mong. Amongst the Mongols, the title of the highest class of the priests of Buddha. The one resident at Oorage is called by the Mongols Gheghen Koutoutkow. The Oorage high priest seems also to be called Geesoo-taibha, and is a regenerated Buddha of great sanctity. There are 30,000 lamas under several heads at Oorage. See Gawwa; Kouren; Koutoutkow.

GEETA. Sansk. Properly Gita, from Goi, to sing a hymn or song. Bhagavat Gita, a divine song, a Sanskrit poem in the form of a dialogue between Arjuna and Krishna. That Geeta is a discourse on the Yoga philosophy. See Gita.

GEHAR, a large class of child-stealers in the valley of the Narbadda.

GEHENNA, a valley celebrated for the inhuman and barbarous, as well as idolatrous, worship paid to Moloch, to which deity parents often sacrificed their offspring, by making them pass through the fire (2 Kings xxiii. 10, 2 Chron. xxviii. 3). To drown the lamentable shrieks of the children thus immolated, musical instruments (Hebrew, Toph) were played; whence the spot where the victims were burnt was called Tophet. After the captivity the Jews regarded this spot with abhorrence, on account of the abominations which had been practised there; and, following the example of Josiah, they threw into it every species of filth, as well as the carcasses of animals and the dead bodies of maleslaves, etc. To prevent the pestilence which such a mass would occasion if left to putrefy, constant fires were maintained in the valley, in order to consume the whole; hence the place received the appellation of Gehenna, the Jannah of the Arabs. By an easy metaphor, the Jews, who could imagine no severer torment than that of fire, transferred this name to the infernal fire,—hell, to that part of the invisible world in which they supposed that the demons and the souls of wicked men were punished in eternal fire.—Robinson's Travels, p. 107.

GEHLOT, a Rajput race founded by Bappa. They long held power in Saurashtra. Before they became Saiva Hindus, they chiefly worshipped the sun. The name is also pronounced Grassot. Arore, on the Indus, is said by the Gehlot to have been their ancient site, and they claim to be the Balileputra who occupied it. They were driven from Balabhatara when it was taken and sacked by the Huns or Pathians. The Gehlot clan was subdivided into twenty-four sacha or ramificatons, few of which exist,—the Aharya, at Dongpur; the Mangulia, in the desert; the Sesodia, in Mewar; and the Piparra, in Marwar. Bappa, the Gehlot chief, born A.D. 713, obtained Chitora 728, and abandoned it 764. From the Gehlot they have branched the Sesodia and Aharya. They are spread over different parts of the North-West Provinces. The name Sesodia is said to be from Sesoo, a bare. Their neighbours, who for some unexplained reason are fond of imputing cowardice to them, say their name Gehlot is derived from Gehla, a slave girl. But the origin believed in Mewar is the following:—When the ancestors of the rana of Mewar were expelled from Gujarat, one of the queens, by name Pushpavati, found refuge among the Brahmanas of the Mollina mountains. She was shortly afterwards delivered of a son, whom she called, from the cave (Goha) in which he was born, by the name of Gehlot; from him are descended the present ranas of Mewar or Udaipur. Their claim to be descended from Nushirwan and a Grecian princess, which has frequently been discussed, invests this clan with a peculiar interest.—Elliot; Tod's Rajasthun, i. p. 84. See Kenkosen.

GELISHA, in Japan, dancing girls who also play and sing.

GELASIMI, land-crabs; most of these have a single large claw. They move about with that half erected, and quickly retreat to their holes in the sand. There are several species known,—G. annulipes, Indian seas; G. Dussumieri, G. tetragonum, of the Red Sea, Mauritius; G. foreperces, Edwards, of Australia; G. cordiformis, Edwards, Australia.—Collingwood.

GELATINE.

Ghruru-ul-jallad, Arar. Siras; Sirat, Hind., Pers., Yul-kwan, Fiu-kwan, Chin. Surehman-l-jallad, G. Gelatine is obtained from skins, cartilage, tendons, membrane; also from the parings of hides or horns of any kind, the peels obtained from furrers, the hoofs and ears of horses, oxen, calves, sheep, etc.; from the rasps and trimmings of ivory, the refuse pieces and shavings left by button-mould makers, and from other kinds of hard bone. Size, again, is made by boiling down in water the clippings of parchment, glove leather, fish-skin, and other kinds of skin and membrane, and is used either alone or mixed with flour, paste, gum-arabic or tragacanth, and employed by bookbinders, paperhangers, and painters in distemper. Gelatine is one of the principal constituents of most of the animal substances employed as food. The Chinese import various substances, which can be valuable only as yielding gelatine of different degrees of purity,—agar-agar, trepang, birds'
GELIDIUM CORNEUM.

GEOGRAPHY.

This pretty evergreen tree is found in the Rangoon district and Northern Circars; it seldom exceeds 3 feet in girth. Wood, white colour, fit for house-posts, and adapted for every purpose of house-building, weighs 50 lbs. per cubic foot. It is common in rather open forests, up to an elevation of 4000 feet. It is a very variable plant; and Dr. Thwaites thinks that all the specimens he has seen of the genus, from different and distant parts of India, might with safety be referred to one species.—Roeb. iii. p. 831; Thuc. Zeyl. p. 274.

GELUM. TIBET. A monk.

GEM, a term employed by jewellers to designate the more beautiful of the precious stones. Gem sand, from the neighbourhood of Ava, is sometimes one of the Shan articles of merchandise. It consists of small fragments of nearly all the precious stones found in the country; but garnet, beryl, and spinel are its principal constituents, more especially the last, which seems to constitute more than three-fourths of the whole mass. A single bundle will contain specimens of every shade,—black, blue, violet, pale, rose, orange, amber yellow, white, brown, and white. Many retain their original crystalline forms; some have the fundamental form of the species, a perfect octahedron; but many others have some of the secondary forms, among which it is not uncommon to see twin crystals re-entering angles, formed by two segments of the tetrahedron truncated on the angles, and joined together by their bases.—Mason.

GEMELLI - CARERI. Giovanni Francesco Gemelli-Careri, of Naples, wrote the Giro del Mondo, a narrative of his six years' travels round the world, and which was published in 1699. He notices that at his time the remittances of the conquests of the Portuguese in Asia were so inconsiderable, as scarcely to defray their own expenses.

GEMITORES, in natural history, an order of birds, comprising in India the families Treronidae, Columbidae, and Gouria. See Birds.

GENDARRUSA VULGARIS. Nuts.

GENTIANACEAE, an order of plants, growing in most parts of the world,—in Japan, Arabia, and the E. Indies. The whole order is bitter as a characteristic, both in the stem and roots, and used as a tonic. G. umbellata grows in the Caucasus; G. decumbens, L., is common at considerable elevations in the various parts of the Panjab Himalaya; a tincture of it has been used as a stomachic by the Lahouli missionaries. Gentian root is a bitter tonic, and before the discovery of cinchona it held the first place among febrifuge remedies, and it is still deemed a very useful medicine in intermittent diseases. A perfect substitute for the infusion of gentian is made from the Gentiana kurroo, common in the Himalaya, and is much used in native practice. Species of Agathotes, Exacum, Justicia, Cicendia, and Ophelia, of this and other orders, are possessed of the same properties as gentian. Gentiana asclepiadea, Smith, Lung-tang-tsa'u, grows in Shen-si. Its roots are agreeably bitter.

GENTIANA KURROO. Wall.

Pneumonanthe kurroo, Don, Boyle.

Grow at Simla and other parts of the Himalaya, at from 3000 to 9000 feet. The roots are used like the gentian.—O'Sh. p. 459; Cegnorn's P. Rep. p. 658; Stewart.

GENTIANA TENELLA. Fries. The Tita of Ladakh and various parts of the Panjab Himalaya, up to 15,000 feet in Ladakh. In Lahoul, a decoction of the leaves and stems of this and other species is given in fevers. In Ladakh its root is put into spirits.—Dr. J. L. Stewart.

GENTIL, author of Voyages dans les Mers des Indes, 1660.

GENTILE, a term used by the Jews to designate all races not Jews or not circumcised. It answered to the Barbaros of the Greeks and Romans. The term was employed by the Europeans in India to designate the Teling people, the races occupying the country from Madras to Ganjam, it is pronounced Gentoo, and the people themselves accept that designation. The Gentile of the Jews was the same as that of the Mehlcoans, the Aryans, the Aryan Hindu, the E of the Chinese, and the Kafir of the Mahomedan. Among the Arabs, they themselves are the Arab-ul-Arab; all the rest of the world are Ajami, or foreign. Gentoo is a corruption of the Portuguese Gentio, a Gentile. Dr. Fryer (Travels, 1672 to 1681) says 'the Gentues, the Portuguese idiom for Gentiles, are the aborigines.' He appears to be the first English writer by whom the term was used; but before his time, Pietro del la Valle speaks of the Hindus as Gentile, following the example of the Portuguese. Notwithstanding those unquestionable authorities, Hallhed (Gentoo, Code xxi. xxii.) supposes that the Portuguese borrowed the term Gentoo from the Sanskrit word Gunt, a sentient being.—Elliot.

GEOCICHLA CYANOTUS, the Madras bulbul.

GEOGRAPHY of India, in ancient times, became slowly known to the learned men of the West. In the centuries immediately preceding the Christian era, the conquests of Alexander threw open the interior of Asia as far as the Indus and Afghanistan, and Greek colonies bearing the conqueror's name were established on the sites of Herat and Kandahar. Megasthenes, the
Marinus extended Asia to the E., he extended it proportionately to the S.E. Rumourers had already reached the author of the Periplus of the Erythraean Sea concerning Cochin China and the Malay Peninsula. On the strength of these and of other information of his own, Marinus conceived the continent as stretching far away in that direction, and then bending round and joining the S. of Africa. No doubt this tremendous extension of the length of the inhabited world by Marinus, accepted as it was by Ptolemy, by shortening the voyage across the Atlantic to India, was an additional incentive to the adventure of Columbus.

Claudius Ptolemaeus, who may be said to be the last great ancient geographer, wrote about a.D. 150. He was a mathematician and astronomer, and regarded geography from a corresponding point of view. Ptolemy's information about the source of the Nile is more correct than Europeans possessed till Speke and Livingstone. It must have come to him via Zanjibar, down which point the author of the Periplus of the Erythraean sea has some acquaintance with the coast.

Ptolemy places Cape Comorin very little to the south of the mouth of the Indus. Massilia and Byzantium are still placed on the same parallel of latitude, and help to distort the whole map of Europe.

The northern provinces of British India occupy a great unbroken plain, which extends from the Himalaya mountains to the Arabian Sea and the Bay of Bengal, and is traversed by the rivers Indus and Ganges and their tributaries. The central and southern portion projects into the Indian Ocean. It is roughly triangular in shape, and its larger part consists of a hilly plateau or table-land. On the western flank of this plateau are the Aravalli Hills, which separate Rajputana from the plain of the Indus, and the Syhadri or Western Ghas, which rise abruptly from the sea to an elevation that seldom exceeds 4000 feet, though the Neelgherry mountains, near the southern end of the range, rise to 8760 feet. The eastern margin of the plateau is known as the Eastern Ghas. In Mysore the plateau rises to 3000 feet, but the average altitude of the central parts is about 1500 feet above the sea.

GEOLOGY. India has been summarized, during the 19th century, by Mr. James Calder, Captain Newbold of the Madras army, Surgeon Carter of the Bombay army; and lastly, and in the highest sense, in a joint work by Messrs. H. B. Medlicott, M.A., and W. T. Blanford, F.R.S. Its most striking feature is the difference between the rocks of the Peninsula proper and those of the countries lying beyond the great Indo-Gangetic alluvial plain. The investigations of Dr. H. Falconer have shown that, at a period geologically recent, the present Peninsula of India was a triangular inland area, bounded on each side by the E. and W. Ghas, converging to Cape Comorin, while the base of the triangle was formed by the Vindhyas mountain range, from which an irregular spur, forming the Aravalli mountains, extended northwards; while between the northern shore of this island and a hilly country, which is now the Himalaya mountains, ran a narrow ocean strait. The bed of this strait was covered with debris from the adjacent Himalaya on its northern shore, and with this debris became entombed and pre-
served many and various animal remains. The present condition of the country in northern India has been produced by a subsequent upheaval of the land, so that what was the ocean strait forms the northern plains of India, the long, nearly level valleys in which flow the Ganges and the Indus. Besides this, a great upheaval along the line of the Himalaya has elevated a narrow belt of the plains into the Siwalik hills (determined to be of tertiary age), and added many thousand feet to the height of the Himalaya; and facts tend to the conclusion that India had one long term and one protracted faunas, which lived through a period corresponding to several terms of the tertiary periods of Europe.

The rocks of the Peninsula, though for the most part of very ancient date, are far less disturbed than those of the Himalaya, Afghanistan, and Burma, many of them, like the Vindhyan sandstones, being still quite horizontal. All the evidence goes to show that from a very early period in the history of the world, the greater part of the Indian Peninsula has been dry land; whereas for many ages the Himalayan area was occupied by the sea, and the rocks of that region have been, down to very recent times, and probably still are, subjected to violent crushing and contortion. In fact, the arrangement of the strata shows that, notwithstanding the existence of the great volcanic rock which constitute the Deccan, the Indian Peninsula has from the earliest ages been one of the steadiest and most fixed portions of the earth's crust, whilst the Himalayan area has been subject to violent oscillations of level; and the highest mountains in the world probably owe their height to the circumstance that the elevating forces are still in operation.

The oldest rock known to occur in India is the gneiss of Bundelkhand. It is exposed over a roughly triangular area, lying between Kirkee, Gwalior, and the southern part of the Lallipur district. Along its northern edge it is covered by the Gangetic alluvium, and on the other sides it is bounded by a steep escarp of Vindhyan sandstones, or by a series of sub-metamorphic rocks underlying the Vindhyan. Two other areas of gneiss occur in the Peninsula, but from their relations to the sub-metamorphic series, they are supposed to be of an age posterior to the gneiss of Bundelkhand. One of the extends, with hardly an interruption, from the Ganges in the neighbourhood of Bhagulpur, to Cape Comorin, and from the coasts of Madras and Orissa to Vindoria and Nemaur, where it is covered by the Deccan trap. The other occupies the central and southern part of the Aravalli Hills in Rajputana, and it may be continuous with the eastern gneiss of the Nerbudda valley, underneath the trap. An outlier of the same kind of gneiss occurs in Assam.

The gneiss of Bundelkhand is of remarkably simple and uniform composition, while that of the south and east of the Peninsula is much more complex, and contains many extraneous minerals, among which may be mentioned the gold of the Wynad, and the immense deposits of magnetic iron ore that occur in many parts of the country. Resting upon the Bundelkhand gneiss, but more or less disturbed where in contact with the other gneiss of more recent age, is a series of partially metamorphosed strata of great thickness, called the Bijawars, in Bundelkhand. This group of strata can be traced on the outskirts of the gneiss, from Sillang in Assam to the Nerbudda valley. Similar rocks flank the Aravalli Hills; and detached outliers occur through Northern Rajputana and the S.W. Panjab, as far as the Korana Hills, beyond the Satlej and Sutlej, and within a few miles of the Panjab Salt Range. An upper series of transition rocks can be traced near Gwalior, and in parts of the Madras Presidency.

Over these, and resting unconformably upon them, comes the most widely distributed series of stratified rocks to be found in India,—the so-called Vindhyan system. This immense series of horizontal sandstones and shales extend from Sasseran and Rotasgarh on the Sone, to the borders of Mewar, and from Agra to the Nerbudda valley, with several outlying patches in Southern India, as at Bhitna and Kurnool. All the diamonds found in India seem to be derived from a pebble bed at the bottom of the Vindhyan series, but the diamonds occur simply as water-worn pebbles, so that their original matrix is still unknown. That such an immense area of perfectly undisturbed and quite unaltered rock should be totally devoid of fossils, is very puzzling to the geologist, yet such appears to be the fact. The only explanations of it that can be given, are either that the Vindhyan rocks were deposited before the beginning of life on the globe, or that there was something inimical to life in the composition of the waters in which these rocks were formed. There is no evidence whatever, except the mere absence of life, that either of these explanations is correct; but, on the whole, it seems most probable that the Vindhyan strata were deposited in fresh water, at a time when the dry land and the waters enclosed by it were without life, although some kinds of living beings may have existed in the contemporaneous seas.

Resting in hollows of the ancient gneiss or the Vindhyan rocks, are found the first fossiliferous strata of the Indian Peninsula,—those of the Gondwana system, or the Indian coal measures. These rocks extend in patches from West Bengal through South Icowa and the Nerbudda valley to Cutch, and they are also found in the valley of the Godavery, and as far south as Madras. A small outlier of the same name has been discovered at the base of the Himalaya, near Darjiling, almost the only instance of a Peninsular rock occurring in the extra-Peninsular area.

At the bottom of these rocks, wherever the base can be seen, is found a peculiar conglomerate, consisting of boulders, many of them of large size, embedded in a fine matrix. Some of these boulders are marked with parallel strike on one or more sides, and the appearance of the whole stratum is that of an ancient boulder-clay deposited from icebergs. Similar rocks are observed in S. Africa and in the Permian formation of Europe, and it is probable that these Talchir beds are of Permian age. Above the Talchirs lie the coal-bearing strata of Karharbari, and the Damoda series of coal-bearing beds found here and there over the country from Rauganj to the valleys of the Badda and Wardha rivers. These are no doubt economically the most important of the Indian strata, though they cover a very small area compared with that occupied by the Vindhyan rocks or the ancient gneiss.

The coal-bearing strata contain numerous plant
remains, and a few skeletons of terrestrial animals belonging to the amphibia, but not a trace of any marine fossil has yet been discovered in them. There has been a good deal of discussion about the age of these beds, and of those overlying them, the Panchets, Jubulpur bed, and Mahadeva; because the fossil ferns they contain resemble on the one hand those of the Trias of Europe, and on the other they are very like those found in the true carboniferous rocks of Australia. The lower rocks of the coal-bearing series are supposed by Mr. Blanford to be of Permian or carboniferous age, and the upper ones (Panchet) Triassic. There can be no doubt about the proper geological horizon of the uppermost plant-bearing beds,—those of Cutch and Rajmahal,—which are distinctly Jurassic in their fossils, and contain in Cutch marine animal remains, such as ammonites of Jurassic age, interstratified with the plant beds. Of the Cretaceous rock, only a few detached areas exist in the Indian Peninsula, and these are all, with the exception of some beds at Bagh near Indore, within a few miles of the present coast.

Overlying the cretaceous rocks of Bagh, and overlaid in turn by the Eocene beds of Gujerat, are the great horizontal sheets of the Dekhan trap,—the greatest accumulation of volcanic rock known in the world. The trap extends in the north and south direction from Belgaum to Nemin, and spreads from Kattyawar on the west, to Amarakan on the east, covering every kind of rock, from the Bundelkhand gneiss to the most recent cretaceous formations, with its great horizontal lava flows, and in parts of the Western Ghats it is more than 4000 feet thick. It has been surmised that the lava must have been ejected on dry land, and not under water, because in some parts, as near Naldrug, the upper part of nearly every flow is full of vesicle, now occupied by zeolites and other minerals. How this could have been accomplished so as to leave all the beds nearly horizontal, and without trace of a single volcanic cone, is not apparent. But Dr. John Grant Malcolmson, who in the early part of the 19th century described this great volcanic outburst, discovered in the Gawilgarh trap many casts of marine shells.

The following is a classified list of formations in Peninsular India, with the approximate maximum thickness in feet:—

Classified List of Formations in Extra-Peninsular Territories of British India.

1192
GERANIAEE, the geranium tribe, largely cultivated as flowering plants. They are propagated by cuttings, which ought to be kept somewhat dry till they root. The root of G. Nipalense, Surt., is called Röwil and Bland; it grows in the Himalayas, and is said to be astringent, and useful in diseases of the kidneys.—Powell; Voigt.

GERARD, two brothers, one a medical, the other a military, officer in the Bengal army, who distinguished themselves by their researches into the physical geography of the Himalaya. Dr. Gerard wrote an account of Kanawar, which he accompanied Lieut. (afterwards Sir Alexander) Burnes for a great part of the road, in his travels in Central Asia. Captain Alexander Gerard of the Bengal Engineers was employed in surveying the Himalayas, which he ascended to the height of 19,000 feet. He was afterwards employed in Central India. His Account of Kanawur, edited by George Lloyd, appeared in London in 1841.

GERARDINIA LÉSCHENAUTIANA. Dcne. A tree in the central province of Ceylon, at 5000 to 6000 feet.—Thur.

GERBILLUS INDICUS. Blyth. Jerboa rat. H. Hardwicke, Gray. | G. Cuvier, Waterhouse. Jhenki Indur, | BENG. Yeri yelka of WADDARS. Dilla iichi, | CAN. Tel yelka of. | YENADI. Huna Mus., | HISP. The India jerboa rat of all India and Ceylon is of the family Muridae. The jerboas are field rats of Asia and Africa, with small fore limbs and well-developed hinder limbs, with slender form and large eyes. The colour is always of uniform bright fawn. The incisors are always of a deep yellow colour, the eyes very large and full, the tail longer than the body. A large adult male measured,—length of body, 7 inches; of tail, 8½; of head, 2½; of ear, ½; of fore foot, ½; of hind foot, 2. Weight, 64 oz. They are said to be very prolific, bringing forth 16 to 20 at a birth, but this seems an exaggeration, and the litter probably seldom exceeds 12. It is the common prey of foxes, owls, snakes. Lives in numerous societies, making

---

GEOMYDA, a genus of the Cataphracta, or shielded reptiles, the order Chelonia and family Geemydidae. G. Bealli, granda, mutica, nigricans, Reevestis, spinosa, spengleri, and trinarina, occur in S.E. Asia. See Reptiles. GEOPHILUS FULGENS, a luminous centipede. GEOPHILUS NICOBARICUS is the Columba Nicoberica of Latham, the C. Gallus of Wagler. It inhabits the isles of Nicobar, Java, Sumatra, and many of the Moluccas. GEORGIA is BACTRIANIA, a native of Khorasan, a physician celebrated for his skill in medicine and for his proficiency in the Persian language. He was educated at the medical school at Nessa or Jondisabur. He was sent to serve under the Khalif-ul-Mansur, and at whose request he translated several books on medicine. His son Gabriel was physician to Harun-ul-Rashid.

GEORGIA, a Russian province extending from lat. 39° to 44° N., and long. 37° to 50° E., consisting, with the exception of Daghestan, of all Russian territory S. of the Caucasus. It is 417 miles long, 280 miles broad, and with an area of 56,000,000 square miles; population above a million. Its divisions are Abasia, Baks, Daghestan, Erivan, Guria, Immeritica, Kakhetia, Karabagh, Kartelhnia, Kuba, Mingrelia, Lesgistan, and Shervan. The rivers are the Aras and Kur, with tributaries. Georgia is called by the Persians Gurgistan, and by the Turks Gurishi. The last reigning king ceded it to Russia on the 20th of May in 1800, and in 1802 it was made a Russian government. The hills of Georgia are covered with forests of oak, ash, beech, chestnut, walnut, and elm, encircled with vines, growing perfectly wild, but producing vast quantities of grapes. Cotton, rice, wheat, millet, hemp, and flax, are raised on the plains. The valleys afford the finest pasturage, the mountains abound in minerals, and the climate is healthy. Georgian women have fine dark large eyes, very regular features, and a pleasing mild expression of countenance. The dress of the higher ranks is splendid, and carefully adjusted. The Georgian dance consists of feats of activity, and strange and inelegant contortions of the limbs, sitting down on their heels, and hopping about in that position.—Porter's Travels, i. p. 123.
extensive burrows in the red gravelly soil of the Mulnaad, generally in or near the root of shrubs or bushes. The entrances, which are numerous, are small, from which the passage descends with a rapid slope for two or three feet, then runs along horizontally and sends off branches in different directions. These galleries generally terminate in chambers from half a foot to a foot in width, containing a bed of dried grass. Sometimes one chamber communicates with another, furnished in like manner, whilst others appear to be deserted, and the entrances closed with clay. The centre chamber in one burrow that was opened was very large, which the Waddars attributed to being the common apartment, and said that the females occupy the smaller ones with their young. They do not hoard their food, but issue from their burrows in the evening, and run and hop about, sitting on their hind legs to look round, making astonishing leaps, and on the slightest alarm flying into their holes. The Waddars eat this species. Another species, O. crythrousurus, Jerdon, inhabits the Indian desert west of the Jumna, Hurriana, and adjacent districts.—Jerdon.

GERMAN, a race in central and northern Europe, who form, with the Irish, English, Scotch, Persians, Aryan Hindus, Greeks, and Romans, part of the great Iranian family. Philologists admit a Germanic family of languages.

GERMANES, a sect of ascetics mentioned by Megasthenes, supposed to have been Buddhists. See Sarmanes.

GERRA or Gerra was in ancient times a great emporium in the Persian Gulf. Its ruins are to be seen at the inmost recess of the deep and narrow bay, at the mouth of which are the islands of Bahrein.

GERU. HIND. Red earth, ochre. The earths and clays met with in the Panjtab bazars are,—

Geru, a hard, red, laminated earth, sometimes used in dyeing; school teachers grind it up with water and teach to write with it on wooden slates. It is used medicinally in India.

Gil-i-khardya is a variety of Geru.

Gil-i-aboroshi or Gil-i-farsi is a pink clay, hard, but brittle and paler than Gil-i-irmani.

Gil-i-makhut, a variegated earth, deep red and pure white, soft and irregular; it contains clay, carbonate of lime, and sesquisioxide of iron.

Gil-i-irmani differs little from Geru and Geri. It is a rough, red, brittle earth, occurring in laminated masses, used as a colour, and also medicinally. It is the representative of the Bolus Armeniacus, once so celebrated as a European medicine.

GETE, an ancient race, supposed by Professor Wilson to be the Sace. Dr. Jaimison proves satisfactorily that the Gete, Scythians, and Thracians were the same people, and that it is very probable, if not certain, that the Gete and Getae were the same people. On the northern side of the Danube, opposite to the territory occupied by the Scythians, and in the angle forming a part of Thrace, there was a small nation in the time of Herodotus, who bore the name of Gete. The Massagete and Gete seem gradually to have advanced from their ancient limits into the more fertile districts of Asia. And all the lower and middle parts of the western boundary of the Indus went by the name of Indo-Scythia. The Scythians, chiefly the Gete, had expelled the Greeks, and re-peopled it with colonies of their own nation. The Getae were the bravest and most just of all the Scythians, and continued to preserve this character in their new possessions. Getae, Jit, Jit, and Takshak races, which occupy places amongst the 36 royal races of India, are all from the region of Sakatia or Chaghtai. Regarding their earliest migrations the Puranas furnish certain points of information, and of their invasions in more modern times the histories of Mahomed of Ghazni and of Timur abundantly acquaint us. If we examine the political limits of the great Getae nation in the time of Cyrus, six centuries before Christ, we find them little circumscribed in power on the rise of Timur, though twenty centuries had elapsed. At this period (A.D. 1330), under Timur, the last prince of Getae race, the kingdom of Chaghtai was bounded on the west by the Dihasht-i-Kapchak, and on the south by the Jaxartes or Jilun, on which river the Getae khan had his capital. Khojend, Taslikand, Ootrar, Cyruspolis, and the most northern of the Alexander battles and the fortress of the borders of Chaghtai. From the mountains of Joul to the shores of Makran, and along the Ganges, the Jit is now widely spread. The Takshak or Takiuk may probably be discovered in the Takj, still in his ancient haunts, the Transoxiana and Chorasania of classic authors; the Mawar-ul-Nahr of the Persians; the Turan, Turkistan, or Tocharistan of native geography, the abode of the Tachari, Takshak, or Toorsika invaders of India, described in the Puranas and existing inscriptions. The Getaes had long maintained their independence when Tomyris defended their liberty against Cyrus. Driven in successive wars across the Sutlej, they long preserved their ancient habits as desultory cavaliers, under the Jit leader of Lahore, in pastoral communities in Bikanir, the Indian desert, and elsewhere, though they have lost sight of their early history. The transition from pastoral to agricultural pursuits is not far from the descent of the moderns of Transoxiana is now the best husbandman on the plains of Hindustan, but during the rebellion and mutiny of 1857 they marched boldly under British leaders to aid in restoring order. Asi was the term applied to the Getae, Yeut, or Jut, when they invaded Scandinavia and founded Jutland.—Tod’s Rajasthan; Pennant’s Hindoostan; Chatfield’s Hindustan; Recherches sur les Langues Tartares; Kennedy on the Origin of Languages.

GHADA or Ghur-Kudd. ARAB. A thorny bush. Its succulent leaves are the favourite fodder of the camel of Arabia. It grows 4 or 5 feet high, has a reddish stem and green flashy leaves.—Lady Anne Blunt.

GHADI. MAHR. A Sudra attendant on a village temple.

GHADR. ARAB. A fanatical practice of Shah Mahomedans of India on the 15th of Zilhaja, when three images of dough, filled with honey, are made to represent Abulkar, Umar, and Uzaim, which are stuck with knives, and the honey is sipped, as typical of the blood of these khilifs, whom they regard usurpers. The festival is named from Ghadir, a pool.—Mahomed, it is said, having declared Ali his successor at a place called Ghadir-Khum, a watering-place for caravans half between Meeca and Medina.—Wilson.

GHADSI or Garsi. MAHR. Vagrant musicians, said to be descendants of the race who formerly
inhabited the great southern forest, the Danda-
karanya. They are village pipers and drummers.
—W.

**GHAFFAH** or Guffa, the burning alive of a
Sanyasi.

**GHAGGAR**, a river in the Panjab and Raj-
petau. It rises among the Himalayan slopes in the
native state of Nahan or Simurn (lat. 30° 41'
N., long. 77° 14' E.). In ancient times the lower
portion of the river appears to have borne the
name of its confluent, the Sutlawati or Sutlawan,
which joins the main stream in Patiala territory.
At present, however, every valley through which
the stream passes has diverted a portion of its
waters for irrigation.—**Imp. Gaz.**

**GHAGRA.** HIND. A petticoat of Meo women;
a skirt worn by women from Malwa, Gujerat,
Kattyawar, and Cutch, also by Burghu girls in
Bombay, fastened by a band round the waist, and
reaching the ankles. The ghagra and choli are
comparatively modern innovations, adopted by
Hindu and Jain women from the Mahomedans.
In the south of India and in Burma, it is the popular
belief that women were made to bare their breasts
to allure the male population; but it is a fact
that till the conquest of India by the Mahomedans,
made-up apparel was unknown. Rajput ladies
have only three articles of parure,—the ghagra or
petticoat, the kanchi or corset, and do-pati or
scarf. The fashion varies in each province and
tribe, though the texture and materials are every-
where the same. Cotton in summer, and quilted
chintz or brocadelin winter.—**Tod’s Rajasthan.**

**GHAILAS-ud-DIN-bin-HUMAM-ud-DIN** is
known by his takhallus or literary name, Khond-
amir. His book is entitled Habib-us-sayar-fi
afraid-ul-bashar, the curious part of the lives of
illustrious men. It is a history which he had
extracted from that which his father Mirkhond
had composed and entitled Rauzat-us-Safa, but
to which he made augmentations. He dedicated
this book to the secretary of state belonging
to the king of Persia, Shah Issam Safavi, who
gave him the name of Habib-Ullah; and for
that reason the book had the name of Habib
given it in the year A.D. 1508, Hijira 927, in
the reign of Louis xii. He was also author of
another book, entitled Khulasat-ud-Akhlar, or The
Cream of Histories, which he completed about
A.H. 900. Khondamir’s last work was the Huma-
yun Namah, which he finished A.H. 940. He
was born at Herat, about A.H. 890 (A.D. 1470),
and died A.H. 941 (A.D. 1634-35). At his death his
title was Amir-i-Akbar, Prince of News.—**History
of Genghiz Khan.** p. 422 ; **Eliot, II. of India.**

**GHAIR.** ARAB. Without.

Ghair Mulazim, as opposed to Mulazim, persons
in the villages of the Panjab who help the farmers,
but are not regularly hired cultivators.

Ghair-Mahdi, a Mahomedan sect who believe
that the imam Mahdi has come to the world and
gone. The words mean, without, or deprived of,
Mahdi. See Elias; Mahomedan.

**GHAAKKAR.** A Scythic race inhabiting the
banks of the Indus. The Ghakkar was a warlike
tribe in the time of Mahmud of Ghazni, inhabiting
the Salt Range or Juhd mountains, between the
Indus and the Belu (Hydespeus). The Mohgal,
and subsequently the Durrani, failed to master
them, but the Sikh rulers, after having been
frequently foiled, at length nominally accom-
plished their subjugation by stirring up internal
faction, and by the perpetration of acts of cruelty
and treachery (Rec. Govt. of India). The
Ghakkar opposed Mahmud; in 1205 they ravaged
the Panjab to the gates of Lahore; in 1206 they
stabbled the Mahomedan sultan in his tent.
They were converted to Mahomedanism, and in
1526 submitted to Baber, in return for a grant of
country. During the next two centuries they
rendered great services to the Moghil dynasty
against the Afghan usurpers, and rose to high
influence in the Panjab. They were driven from
the plains by the Sikhs in 1765 A.D., but they
maintained their independence on the Muree Hills
till 1830, when they were crushed after a
bloody struggle. In 1849, Rawal Pindi, with the
rest of the Panjab, fell to the British, but the
Ghakkar revolted four years afterwards, and
threatened Muree as late as 1857. They now
number only 10,153 souls, described as a fine
spirited race, gentlemen in ancestry, and bearing
and clinging under all reverses to the traditions
of noble blood.

At an early period of history they were given
to infanticide. It was a custom, says Ferihshtah,
as soon as a female child was born, to carry her
to the market-place, and there proclaim aloud,
holding the child in one hand, and a knife in the
other, that any one wanting a wife might have
her, otherwise she was immolated. By this
means they had more men than women, which
occasioned the custom of several husbands to one
wife. When any one husband visited her, she
set up a mark at the door, which, being observed
by the others, they withdrew till the signal was
removed. They continued polyandrie till Baber’s
time. The Ghakkar are supposed to be the
descendants of the mountaineers whose chief
Ambiasces sent ambassadors with presents to
Alexander. Baber writes the name Guker, but it
is also written Ghanka and Khaka.—**Tod’s Rajas-
than, i. p. 658 ; Imp. Gaz. iv. p. 278.**

**GHAMETA.** A subdivision of the Kurmi tribe.

**GHANA or Ghani. MAHR. A heap of grain
which the mistress of a house places on a mortar,
to be given to a Brahman at the Makara San-
kranti, or the sun’s entrance into Capricorn.—W.
**GHANCHO in Gujerat, matmakers.**

**GHANTA.** HIND. A clock, a gong, an hour.

**GHAO.** HIND. A wound, an ulcer; hence
Ghaeja (?), GUJ., the village barber and barber-
surgeon.

**GHAR.** PERS. White quartz, white carnelian;

**GHAIR.** PERS. White, ice, hail; also, ARAB., a
cave.

**GHAIR.** MONGOL. The hand. It is the San-
skrit Kar, the Hindi Gar, and Greek Kheir.

**GHAIR-BASHAH** is the revisiting, by a newly-
marrwed Hindu woman, of her parents’ house.
It is not a day, but is a week, or a month, or
four months. It is a religious duty for the
Gharia, a watch; hence Ghariah, a
gong-striker.

**GHARI.** MAHR. Ghadi. A Sudra attendant
on a temple, corresponding with a Gurara.
GHARIAL. is the Gavialis Gangeticus, the narrow-beaked crocodile of the Ganges, supposed to be the largest of the living saurians. The measurement of the largest mentioned by Messrs. Dumeril and Bibron is given at 6 metres 40 centimetres (17 feet 8 inches). See Reptilia.

GHARIPIT, about 8 miles S. of Palmsahab, in the Hyderabad country. Garnets occur here in the detritus of a granitic rock, penetrated by trap dykes, and composed of mica, garnets, kyanite, quartz, and felspar. Dr. Voysey states that the precious garnets are found at the depth of eight or ten feet in the alluvium at the foot of the rock.

GHARRA. Hind. An unglazed earthen water-pot; hence Ghar-nai, a raft supported on pots.

GHARRA RIVER, the modern Panjabi name applied to the united streams of the Beas and Satlej, from their confluence at Endrisa to their junction with the Chenab. Below this the whole river takes the name of Panjnad.

GHARSI, in the Maharatta country, a tribe of musicians.

GHAZALAR. Arak. Mahomedans have two kinds of ablution or instigation,—the Ghasal or legal washings for all classes, after any kind of bodily uncleanliness, such as the polluto nocturna, menses, coitus, or childbirth, for until purified it is unlawful to eat, pray, touch the Koran, or go to the mosque. If the legal Ghasal be not needed, nevertheless, before prayer, the Wazi or washing in a prescribed manner of the face, hands, and feet, is indispensable. It occupies two or three minutes. The Wazi is only needed when any minor cause of impurity, as in performing the natural functions, has occurred. Where water is not to be had, the Teyammum, or rubbing the face, legs, and hands with fine dust or dry sand, suffices.

GHASI, a servile race in Central India. Wherever there are Kol there are Ghasi, and though evidently of an entirely different origin, they have been so long associated that they are a recognised class in the Kol tradition of creation, which assigns to them a thriftest character, and describes them as living on leavings or on charity. There are not fewer than 50,000 Ghasi in the Kol countries. Their favourite employment is that of musicians. No ceremony can take place, or great man move, without the accommodation of their discordant instruments—drums, kettle-drums, half-drums, and huge horns—to proclaim the event.—Dalton, Ethnol. of Beng. p. 326.

GHASI DAS was a Chammar or leather-worker, who lived in Ch’hatisgarh in the early part of the 19th century. He withdrew himself for six months into the forest, and when he returned he urged the people of his caste to renounce the worship of idols, and worship only the Sadhnam or true name. He died in A.D. 1850, and his son, who succeeded to the office of leader, was murdered in 1860 by Rajputs, whom he had offended. The murdered man’s place was taken nominally by his son, but really by his brother, Agur Das. The sect is now split into two great factions, those who smoke tobacco, and those who deem it to have been prohibited by Ghasi Das. At the time of the census of 1871, the number of the sect in the Central Provinces was 266,000.

GHAT. Hind. A term employed in India to designate a ferry or landing place on a river, or a quarry or wharf; also a range of hills, or the scarped wall of a table-land, or the defile or pass leading through such. The Western Ghats or Syhadri range extend from the valley of the Tapti to the gap of Palghat, a distance of 800 miles. They are clothed with dense forests, with few inhabitants. The coast-line from the sea to their base is generally flat and low, with occasional spurs or solitary hills, but the ghats rise abruptly, almost scarped, to an average height of 3000 feet. Pundarik is 4472, and Mahabaleshwar 4700. Matheran is a projecting spur. The Eastern Ghats extend from Orissa to Coimatore, along the eastern or Coromandel side of the Peninsula of India, at distances of 50 to 150 miles from the Bay of Bengal. They are steep, and well clothed with forests. The country lying between them and the sea is low, scarcely rising above a hundred feet above the sea. Towns, as Hinginhat in lat. 20° 34' N., and Palghat in the south of the Peninsula, have their names from the passes; and Hindus speak of Balaghat and Paen-ghat, above or below the Eastern Ghats. The chief passes in the western range are the Thul, Bhor, and Ram Ghat.

In Rajputana, Antri means a defile, a tract surrounded by mountains. The Antri of Mewar is fertilized by the Brahman, which joins the Chambal after a course of thirty miles through a singularly diversified country.

The Ghatiya is a Brahman who attends at ghats where Hindu pilgrims bathe, to take care of their clothes, and supply sandal, flowers, etc. He exacts certain fees as a right, denouncing imprecations on any who resist his exactions. These people sometimes repair to a distance to escort pilgrims to their places of ablation.

Ghat-manjhi, is a ferryman; also a man who regulates the hire of boats, supplies, etc.

Ghatwal, a guard of the passes in the mountains of Bengal.

GHATAK or Ghataki, in Bengal, matchmakers, men or women.

GHATA-KARPARA, one of the nine learned men of the court of Vikramaditya.—Downson.

GHATATOP. MAHR. A covered conveyance, and framed for concealing a woman.

GHATICA. Sansk. An Indian hour, twenty-four minutes European time. Ghatak-patra, a clepsydra. See Danda.

GHATWAN, in Bengal, a man of a low caste, frequently a predaial slave.

GHAZA. Arak. In Mahomedanism, an expedition against infidels. The term Ghazi is applied to those who fight for their religion to the death; also a gallant soldier; a hero.

GHAZAL. Arak. In Persian poetry, an ode. It should consist of not less than five, or more than eighteen, couplets, the last line of each couplet terminating in the same letter of the alphabet. The two first lines of the ode rhyme together, after which every alternate line; and the last verse always contains the takehallus, the assumed literary name of the poet. A poem on the subjects of love and wine, interspersed with moral and satirical observations.

GHAZAN, son of Kai-Khatau, and nephew of Kablab Khan, succeeded to his father’s throne in A.D. 1295. He was a brave soldier and able statesman.

GHAZI. Pers., Hind. A Mahomedan soldier
fighting for his faith; a religious warrior; one who has slain an infidel. Properly speaking, a man becomes a Ghazi only in war against unbelievers (Kafir), such as Christians, Jews, and idolaters, as Hindus, Buddhists, etc. The Sunni of Central Asia consider Shah Mahomedan as unbelievers, and enslave them. The Othoman Turks have never recognised this theory, considering the Persians as only heretics (Raafiz, Mulhid).—P. Arminius Vambery, Bokhara, p. 351.

GHAZI MIYAN, a Mahomedan saint in high repute with the agricultural and lower classes of the N.W. Provinces, except in Dehli, and included among the Panch-Piri, or five saints. The Mirzat-i-Musawi says he had a dream the night before his death, in which his mother came and placed a bridal chaplet on his brow, as being indicative of the crown of martyrdom with which he was to be honoured on the following day. He is partly on this account called Gajun Doolha and Salar Chancellor of Ghazni. The Mahomedan court paid this honour in most large towns of India, but particularly at Barech, in the month of Joth. It is commonly called the Shadi, or marriage of the saint, in allusion, according to another tradition, to his having suffered martyrdom on the eve of his nuptials. The festival is equally popular with the Hindus and Mahomedans. Who this Ghazi Miyan was, is a question on which even Mahomedan authorities are not agreed. Elliot, quoting M. Garin de Tassy, in his Memoire of the Musalman Religion in India, was of opinion that it is not his shadi or marriage, but his shahadat or martyrdom, that is represented at the festival. He is also said to have been a nephew of Mahmud of Ghazni, born at Ajmir, and killed in battle with the Hindus at Barech, after Mahmud’s death.

GHAZIPUK is the name of a town and of a district in the N.W. Provinces of India. The town is in lat. 25° 18’ 36” N., and long. 83° 35’ 13” E., and has a population of 58,853. The district lies between lat. 25° 18’ 31” and 26° 2’ 10” N., and long. 83° 6’ 20” and 84° 42’ 40” E., with an area of 2167 square miles, and 1,345,470 inhabitants. The town is on the left bank of the Ganges, 64 miles N.E. of Benares, 351 feet above the sea. The palace of Kasim Ali Khan also is there. Rose-water and otto (atr) of roses are largely made.

The district, in 1871, had, besides Brahmans, Rajputs, and Banya,—Ahir, 171,216; Chamar, 122,075; Kayasth, 22,680; Kurmi, 18,136. It is one of the hottest and dampest districts of the N.W. Provinces. The district can boast a long history of its own, stretching far back into the earliest days of Aryan colonisation. Carved monoliths bear witness to a very ancient Hindu civilisation; and one in particular, at Bhiri, contains an inscription of Samudra Gupta, who probably reigned in the surrounding country as far as Kannauj, about the end of the 4th century A.D. Asoka erected here one of his well-known pillars, and at least two stupas. In 1805, Lord Cornwallis died here, and a monument, with a statue by Flaxman, was erected to his memory. He had been appointed Governor-General a second time, and was proceeding up the country, when he fell sick and died.—Tr. of a Hindoo, i. p. 121; Imp. Gaz.

GHAZNI, a town and fortress of Afghanistan, in lat. 33° 34’ N., and long. 68° 18’ E., and 7726 feet above the sea, 85 miles from Kabul, 223 miles N.E. of Kandahar, on the left bank of a river bearing the same name, at the termination of the well-known Turan valley. It is composed of 3500 mud houses, which have flat roofs, with small windows in the upper storey. The circumference of the wall is only a little over one mile. The citadel is almost in the centre of the town, standing upon the summit of the natural mound which forms the city. The wall embraces the whole of this hill, and, regarded from a distance, Ghazni may be said to form a square. The streets are dark, narrow, irregular, and dirty, and the houses several storeys high, with a population of Afghans estimated at 10,000 souls, some Hazara labourers and Hindu shopkeepers. The chief trade consists of grain, fruits, and madder. It was captured by the British Indian army in 1839 (22d July) under Sir John Keane, and again in 1841 under Sir T. Stanhope. Ghazni was taken by the British army under General Stewart in 1880. It is now given a dominion over all Afghanistan. From November to the middle of March, snow lies on the ground. In A.D. 976 it was made the seat of government of Abustakin, a Bokhara adventurer, who was succeeded by Sabaktigin, father of Mahmud.

Mahmud’s empire extended from the Tigris to the Ganges, and from the Oxus to the Indian Ocean. It fell to pieces on his death, and in 1151 Ghazni was stormed by Ala-ud-Din, prince of Ghor, who massacred the inhabitants on the spot, with the exception of those of rank, whom he conveyed to Ghor, and there killed them, using their blood to moisten the mortar with which he constructed fortifications.

From Ghazni westward, all along the valleys of the Turan and Helmand down to the basin of Seistan, the whole country is covered with the ruins of old obliterated cities, and after cultivation all assigned to the devastation of the Tartars in the 13th and 15th centuries, when the Arab rule was overthrown. Ghazni has the repute of being a very ancient site. Wilford, following Sanskrit authorities, tells us that the kings of the Yavana and Daculian resided at it. He further tells us that its proper ancient name was Sabal, Zabol, or Saul, as written by Chrysococce, whence he infers it to be the Osula of Ptolemy. He also conjectures it to be the Oceanidati of the Pentingerian tables, noted as twenty-two farsangs from Asbana, which he considers Kabul, and thirty-five farsangs from Rupha, which he would identify with Shahr Safar. The annals of the Yudo of Jeyshumur state that long anterior to Vikrama they held dominion from Ghazni to Samarcand; they established themselves in those regions after the Mahabharat, but on the rise of Mahomedanism, or the pressure of other races, they were again impelled towards the Indus river. They assert that Ghazni is properly Gajni, founded by the race of Yudo; and in a curious specimen of Hindu geography presented by Colonel Tod to the Royal Asiatic Society, all the tract about the glaciers of the Ganges is termed Gajilun, or Gajilub, the ‘Elephant Forest,’ elephant wilds. There is a Gujungurah mentioned by Abul Fazl in the region of Bijore, inhabited by the Sultano, Jadun, and Yusufzai tribes.

Since the 10th century of the Christian era, the
GHAZNI.

history of this city is but another name for that of the rulers of Afghanistan and Hindustan. It is the starting-point for four practicable routes into India, which are the Kurram, the Urgundeh, the Dawar, and, most important of all, the Gomul, and under a settled administration Ghazni would become a very flourishing town. The country round Ghazni is of remarkably fertility. It is celebrated for its orchards; and the merchants carry on a very considerable trade with India in this and other products, such as tobacco, cotton, etc. On the north of the town, about half a mile from the gate, rises the first of Sultan Mahmud's minars, or towers; the other is about 400 yards beyond it, in the same direction. They both rise alone, based upon rough stone-work. The most northerly is the handsomest structure, but both are exquisite specimens of brickwork. They are about 140 feet in height, and much damaged.

The following emperors have reigned in Hindustan since the Ghazanian conquest—

Ghazanian Emperors began to reign—

Mahmud I., A.D. 999 Ibrahim I., A.D. 1058
Muhammad I., 1050 Musa II., 1089
Musa II., 1063 Arslan II., 1114
Modud, 1040 Bahram I., 1118
Abul Hasan, 1049 Khusrav II., 1122
Abul Rashid, 1051 Khurram II., 1169
Farokhzad, 1052

Ghorian Kings.

Ala-ud-Din, 1152 Shahab-ud-Din., 1176
Safid-ud-Din., 1156 Mahmud., 1206
Ghias-ud-Din., 1157

Slave Kings.

GHEGURA, Hind., also Gheghura, is the unripe pod of gram; also the unripe bole of cotton, which is known also by the names of Goolur, Ghenti, and Bhitta. When it bursts it assumes another name. When this change in the plant occurs, it is usual eastward of the Junna to select the largest plant in the field, and, having sprinkled it with butter-milk and rice-water, it is bound all over with pieces of cotton taken from the other plants of the field. This selected plant is called Sirkal or Bhonguldace, i.e. mother-cotton, from Bhonga, a name sometimes given to a large cotton-pod, and Dace (for Dalaa), a mother; and, after salutations are made to it, prayers are offered that the other plants may resemble it in the richness of their produce. To the west of the Junna there is rarely a Bhonguldace; but when the pods begin to burst, women go round the field, and, as a kind of lustration, throw salt into it, with similar supplications that the produce may be abundant. Tibullus, lib. ii. cl. i. says,—

"Dil patrii, pargamus agros, pargamus agrestes;"  
"Vos male de nostri pollutum libitum."  
"Neu seges etudit hominem fallaceus herbis."  

The practice appears to be observed with a similar object, and in somewhat similar fashion, to the Ambarravina of the Romans, and the Field-Litanies of the English Church Rotation or Gangdays.—Elliot.

GHERIAH, in the Ratnagherry district, Bombay, was the chief town and strongest post of Angria. In 1756 it was attacked and taken by a British squadron under Admiral Watson, and on land by an army under Clive. A Mahrratta army was present, but held aloof.

GHERIAL. 21 miles from Jangipore is Sooty, where the Bhangirath branches off from the Ganges. The neighbourhood of Sooty is remarkable for the battle of Gheriath, fought between Ali Verdi and Sarfaraz Khan in 1740. There was another battle fought in 1763 between Mir Kasim and the British.—Tr. of a Hind. p. 85.

GHET KUCHU. Beng. Typhonium Oxirex; also called Ghet-kol. Tubers the size of a small egg, exceedingly acrid while fresh, and used as a counter-irritant in poultices, also as an application on such ulcers as carbuncles. They are also used inwardly in doses of from 20 to 30 grains. Roxburgh describes this arum as a most powerful stimulant in proper hands.—O'Sh. p. 625.

GHETTA. Hind. A broad curved slipper, worn in Dehi by women and by effeminate men.

GHEWATI. Mahal. A retail dealer, in some places limited to those who sell garden produce.

GHI. Gju., Hind. Clarified butter.

Ghi is largely manufactured in all the south of Asia, and generally sells at 25 per cent. above the cost of butter. Ghi is made in very large quantities in the jungle tracts of the Bar. The finest ghi used on the Bombay side of India comes from Kurachee, near the mouth of the Indus. Butter is churned from the milk as soon as milked; but the people of Southern Asia use ghi. In preparing it, the butter is boiled until all the watery particles and curds have been thrown off by repeated skimmings. When the liquid is clear it is poured into a vessel to cool, which does in a granulated form, and if originally well boiled, will keep for years without taint. Instances are known of its preservation for 200 years in
GHIAOUR.

GHIJIL.

deserted castles. Ghī and sandal-wood are used as a burnt-offering, in Bombay, to invoke Lakh- ḍīr. Ghī is exported to all the sea-coast of Eastern and Southern Asia to the extent of 400 and 500 tons annually.

1877-78 1,044,637 lbs. Rs. 3,57,250
1878-79. 902,835 3,35,800
1879-80. 1,266,433 4,54,844

GHIAOUR, the Gabr or fire-worshipers, now synonymous with Kaตร, is applied to the Parsee people who preceded the Mahomedans, as well as to Europeans—Rich's Kurdistan, i. p. 30.

GHIGOWAH. HIND. Aloc Indica, Royle. In Southern India, plants of the ghigowar, ghicwar, or the külünda, Aloc perfoliata, are suspended with their roots upwards, with a longitudinal incision in each leaf, to permit the aroma of the juice to become apparent, and disperse mosquitoes from the room.

GHILI, a nomadic race dwelling on the coast of Tartary and Siberia, as far as Ayan on the north-west extremity of Saghālin. They are low in stature, stout, and rather broad in proportion to their height. Shape of the head broad; cheek-jones prominent; eyes Globule; well-defined cyliner; more arched than those of the Chinese; hair coarse, black, and bound into a tail, and occasionally wearing a coarse, black beard; hands small and delicate, with well-shaped nails; complexion fair and ruddy. Their language is different from the Tungusian dialects along the river. According to Rinso, polyandry prevails amongst the Smerenkur Ghiliāk. The women are small, but prolific—Dr. Latham's Descriptive Ethnology—Ravenstein's Russians, p. 391.

GHILI, a tribe in Afghanistan, which, with the Abdali, forms the bulk of the Afghan population. The Ghilji occupy the principal portion of the country between Kandahar and Ghazni, and are the most numerous of the Afghan tribes. They are also found between Farrah and Herat, and again between Kābul and Jalalabad. The Ghilji between Kandahar and Ghazi comprise the great families of the Ohtak, the Thoki, the Tereki, and the Andari, with their subdivisions. The Ohtak are the principal of the Ghilji families, and in the period of their supremacy furnished the sovereign. At the present day the Ghilji have two great sections, the Ohtak or Hotaki, with four clans, Sakzai, Tumzai, Sat Kher, and Shagri; and the Turan or Tokhi, with nine clans, Shah Alam, Shah-u-Din, Kalu, Miranaz, Jalallaz, Bakzari, Pir, Likoki, and Amir-khan. The Ghilji are both an agricultural and a pastoral people, dwelling in villages and forts, as well as in tents. They are a remarkably tall fine race of men, with marked features, the Ohtak and Thoki peasantry being probably unsurpassed, in the mass, by any other Afghan tribe for commanding stature and strength. They are brave and warlike, but the generality of them have a sternness of disposition amounting to ferocity, and their brutal manners are not discounted by their chiefs. Some of the inferior Ghilji are so violent in their intercourse with strangers that they can scarce be considered in the light of human beings; while no language can describe the terrors of a transit through their country, or the indignities which are to be endured.

Although the Ghilji are considered and call themselves Afghans, and, moreover, employ the Pushtu or Afghan dialect, the name is evidently a modification of Khalji or Khulji, that of a great Turki tribe, mentioned by Sharif-ud-Dīn in his history of Timur. The testimony of Ferishta, while clearly distinguishing the Ghilji tribes from the Afghans, also establishes the fact of their early conversion to Mahomedanism. Still there is a tradition that they were at some time Christians of the Armenian and Georgian churches. This tradition is known to the Armenians of Kābul; and they instance, as corroborating it, the practice observed by the Ghilji of embroidering the front parts of the gowns or robes of their women and children with figures of the cross, and the custom of their housewives, who, previous to forming their dough into cakes, cross their arms over their breasts, and make the sign of the cross on their foreheads after their own manner.

East of Ghazni, in the province of Zurmat, are the Sulīman Khel Ghilji, exceedingly numerous, and notorious for their habits of violence and rapine. These have no positive connection with the Thoki or other tribes, neither have they one acknowledged head, but are governed by their respective heads, being independent of each other. Dost Muhammad Khan reduced them to the condition of tributaries, after having destroyed a multitude of their castles. Ghilji girls from the age of eight to twenty are not much veiled, but they twist their hair, and tie it like a cake, which hangs over their forehead, and a little below their eyebrows. The centre of the lock (or hairy cake) is adorned by a gold or silver coin, which in black hair shines prettily. This is the sign of virginity amongst the Ghilji. The women allow their twisted locks to hang upon their ears, and even as far as their arms.

At present (1879) they appear to be a nation of families submitting to their natural heads, and having the patriarchal institutions nearly complete. But in the year 1707, Mir Wais, a leading Ghilji at Kandahar, was seized by the Persian governor and sent to Isfahan, where, however, he ingratiated himself, and was allowed to return. On his arrival he resolved to depose the Persian governor, and before his death in 1715, after a reign in Kandahar of eight years, repulsed three armies sent against him.

His son Mir Mahmud, in 1820 invaded Persia. He moved on Kirman with 12,000 men, 5000 of whom perished amid the intervening deserts; but the town was taken and held for four months, when it was retaken by Lutf Ali Khan, and Mir Mahmud escaped with a few followers.

In 1722 he raised an army 28,000 strong, and again took the town of Kirman, but failed to take the citadel; failed also to take Yazd, but marched on Isfahan, which he invested for eight months, when Shah Husien abdicated, and Mir Mahmud massacred the troops who had defended the city. He took Kasvin, whose inhabitants he massacred. In 1724 he reduced Irak and Fars, and took Shiraz after an eight months' siege; but becoming more cruel, he was put to death, and his relative, Mir Ashraf, was raised to the throne. He defeated the Turks near Burujard, took Kasvin, and defeated Thunasp, son of Shah Husien; but Nadar Kuli Khan advanced against and defeated him, and he fled to Isfahan, leaving 12,000 dead on the field. He was again defeated by Nadar Kuli Khan near
Isfahan, losing 4000 Afghans, and fled to Shiraz. He again met Nadir, only again to be defeated, and his soldiers then made terms with Nadir, and Mir Asfah feigned to. Scisian, where he was murdered by a Baluch chief. The seven years of the Ghilji occupation of Persia cost that country a third of its population. The Daurani tribe assumed the sovereignty of Kandahar, and put down a subsequent attempt which the Ghilji made to reassert sovereignty. Towards the middle of the 19th century, when the British advanced to place Shah Shuja on the throne, the Ghilji opposed them, but were driven off on the 22d July 1839. In the same year, Captain Outram with a very small body of troops marched all through the Ghilji country. In 1840 Captain Anderson defeated the Ghilji at Tazi. In 1841 they were defeated by Colonel Wymer near Kalat-i-Ghilzai. But on the 9th October 1841 they attacked Colonel Monteith at Butkak; on the 12th they attempted to occupy the Khurd Kabil pass; on the 14th they attacked the British camp in the Khurd Kabil valley, they attacked Colonel Sale's force in the defiles of Jagdalak, and they hung upon Sale's troops till they reached Jalabad.

On the 6th January 1842 the British began to retreat from Kabil, and from Butkak, till the last man of that force was killed or taken prisoner, the Ghilji surrounded them, attacking, plundering, massacring all. 3000 souls went down in the Khurd Kabil; at Tezin the number was raised to 12,000; at Gandamak 20 muskets were all that could be mustered, and in a few hours more these too were gone. The Ghilji drank their fill of British and Indian blood, in that brigade. In the latter part of 1842 (5th September) they were repulsed in an attack on General Pollock's force, and again on that on Colonel M'Caskill's force.

In the south, on the 29th November 1841, they attacked Ghazni, and in March 1842 the garrison surrendered, and many of the sepoy's were massacred. On the 9th December 1841 they invested Kalat-i-Ghilzai, and by May 1842 had completely surrounded it. On the 21st May they assaulted it in two columns, but were defeated with the loss of 400 men. They subsequently attacked General Nott at Bonei Badam, and the force of General Pollock at Tezin, Haft Kotal, and Jagdalak. Subsequently, in 1841, they were reduced by Amir Dost Muhammad Khan, who sent 25,000 Abdali against them; and when they again rebelled under Muhammad Shah, they were again reduced. — MacGregor: Moorcroft's Tr. ii. p. 300; Masson's Journeys, ii. p. 198; Pottinger's Tr. p. 200; Mohun Lal's Tr. p. 323; Elphinstone's Cabul.

GHINNI. Beng. The female head of an undivided Hindu family.

GHIONT, a Himalaya breed of horses, generally small, strongly made, hard-mouthed, and sometimess almost sovereignable. In ascending hill faces, or passing along the declivities of mountains, it is best to let them have their own way. Their common pace is a kind of amble, and they stop every now and then to breathe, when no application of the whip will move them. They are sure-footed, and sometimes halt at the edge of a precipice, to the horror of the rider. They are not so quick in ascending hills as the low-country horses, but they descend with double the speed, and endure great fatigue. The ghiont in Spiti are bred chiefly for sale. They have two breeds, one a small ghiont, never above 12 hands high, peculiar to the country; and the other a large breed, from 13 to 13½ hands high, is bought from the Chinese, and usually comes from Ochomoorreet; for a Chinese ghiont two years old, they give a Spiti ghiont four years old. All are very hardy, and are kept out the whole winter, except the yearlings, which are housed. During winter the ghiont live on the roots of the stunted bushes, and are very expert at scraping the snow from off them with their fore feet. Many are killed during winter by wolves and leopards.—Powell, Handbook; Capt. Gerard's Koonawur, p. 112.

GHOR, a lizzard of Gujar, which the natives believe to be poisonous. There are two kinds, according to native report, Putlah ghoo and Chundun ghoo. A venomous lizard will, however, be believed in by no naturalist until he has ocular demonstration of the existence of the poison apparatus. Hardly a snake is caught in India, that is not, according to the snake-catcher, the worst snake in the country. See Ghorphara. GHOOS is literally a tribe; and no treaty or transaction was ever carried on in Rupatana without this stipulation. So sacred was the ghoo held, from tyrant usage, that the Peshwa ministers, when they ruled the destinies of their nation, stipulated that the ghoo should go to the privy purse.—Tod's Rajasthan, ii. p. 404.

GHOR, a mountainous country between Kabil and Herat in one direction, and between Kandahar and Balkh in another. It is practically independent, and is peopled by Mongol tribes. They are known to themselves and to the Afghans as the Hazara. According to Istakhr and Ibn Haukal, Ghor was bounded by the districts of Herat, Farrah, Dawar, Rabat, Kurwan, and Ghurjistan, back to Herat, which were all Mahomedan countries; but Ghor itself was a country of infidels, containing only a few Mahomedans, and the inhabitants spoke a language different from that of Khurasan. In the 11th and 12th centuries the kingdom of Ghor comprised Afghanistan, Labor, Sind, and Khorasan. The princes of Ghor are said to have belonged to the Afghan tribe of Suri, and their dynasty was allowed to be of very great antiquity even in the 11th century. Their principal cities seem to have been Ghor, Firoz Koh, and perhaps Bamian.—Bellew; Elliot; Elphinstone's Cabul, i. p. 244.

GHORAMANI, a Baluch tribe in the Dehra Ghazi Khan district.—MacGr. N. W. F. p. 581.

GHORBASTA. The climate of Makran generally, but especially at the level tract south of the mountains, is very unhealthy. The Ghorbasta or Ghorland in Makran are great structures, at times almost bearing resemblance to the Cyclonian remains of Europe. They are evidently remains of a people that occupied or passed through the country long four centuries. Adorn of the equally occupants, who know nothing of the builders, or of the uses of the buildings, and attribute them to cafrs or infidels. They are found usually in out-of-the-way places, narrow valleys at present stone and barren. They are placed always on declivities, or across the mouths of ravines. Their solidity and size are proportionate to the steepness of the declivity. Where there is only a gentle slope, the walls are narrow, low, and slightly built; but
GHOSTS.

where the descent is great, and the flow of water after floods and rains would be violent, they are of great thickness and height, and, as seen in the valley beyond Baghwa, supported and strengthened by buttresses or walls built at right angles. They always present a scarped face to the opposite side, which, when well preserved, is levelled off with the surrounding and higher ground. Those built across the mouths of ravines are very solid and high, and usually the builders have taken advantage of some mass of rock jutting out, as a sort of foundation. Those in slopes are never seen singly, but always in numbers varying with the extent of the ground to be covered, and placed in succession one behind the other. The intervening ground being levelled, is thus formed into a succession of terraces. They were constructed for the irrigation of the country. Those built across ravines were intended to form tanks for the preservation of the waters that come down at irregular intervals in floods. Those on slopes, to economize the distribution of water; the surplus water of one terrace running over and flooding the lower one, depositing as it went a layer of surface soil. The ground thus levelled of course became more valuable, freed from the regularity and roughness which characterize these narrow stony valleys. They are almost confined to the provinces of Jhalawan, and are largest and most important in the southern and south-eastern portions of the province. The ancient city at Gunjuk seems of the same date, and constructed by the same people. From the numbers and position of these structures, the people who built them must have been extremely numerous,—must have felt that the country as existing in its nature was utterly incapable of supporting them; and they must have possessed in energy and ingenuity which the present races are totally without. It appears probable,—nay, almost certain,—that they must have swarmed eastward over the mountains from Makran, making their appearance on the south-west portion of the table-land. Gradually pushing eastward and northward, as their numbers increased, either rapidly by additions from without, or more slowly by increase of the population from within, they ascended to the various valleys as high as Kalat, when, discovering the great eastern outlet, the Moolla pass, they found an exit by it into the plains of India. How long they remained on the table-land, from whence they originally came, and over what countries they eventually distributed, are alike mysteries. There are one or two points of slight resemblance between the Pelagii, the builders of the Cyclopean walls of Egypt, and the ghorbasta builders, suggesting that they might have been a kindred people with kindred habits. The Pelagii came from Asia, not from Asia Minor, nor from Syria, not from Assyria, not from Persia, but probably from that birthplace of emigration, the tract north and north-east of Persia. The ghorbasta builders probably came from the same tract, and were not Makranis, nor Persians, nor Assyrians. The Pelagii existed only a few generations in Greece (about 400 B.C.), before they were turned out by the Hellenes; they must therefore have brought with them when they entered the country their propensity for building massive walls, and commenced their work almost immediately on arrival.

It was probably the same with the wall-builders of Baluchistan; they only remained in the country long enough to allow them to extend northward as far as Kalat, when, meeting with the Moolla pass, they debouched into the plains. Their art was a fully-developed one before they arrived here to carry it out. The Pelagii arrived in Greece about 1400 B.C. This date seems to accord roughly with the advent of the unknown people into Jhalawan.

The ghorbasta buildings differ considerably, however; for, when compared with the Cyclopean remains, they are slight, most roughly executed, and insignificant; yet they evince a like instinct and habit in two races which probably came originally from the same region. Lieutenant Aytoun, in his Geological Report on a portion of the Belgaum Collectorate, given in Mr. Carter's Geological Papers on Western India (p. 392), mentions that certain gorges in the hills had been artificially banded, and the Kalar are a terrace-cultivating race on the Pulney Hills in the extreme south of the Peninsula.—Dr. Cook, in No. vi. Bombay Medical Transactions.

GHRORASTA.

a. 1435, and they yet intervene, never out of the soil. The opposite ground, visible from Mt. Sinai, is named after a certain land. They are almost confined to the provinces of Jhalawan, and are largest and most important in the southern and south-eastern portions of the province. The ancient city at Gunjuk seems of the same date, and constructed by the same people. From the numbers and position of these structures, the people who built them must have been extremely numerous,—must have felt that the country as existing in its nature was utterly incapable of supporting them; and they must have possessed in energy and ingenuity which the present races are totally without. It appears probable,—nay, almost certain,—that they must have swarmed eastward over the mountains from Makran, making their appearance on the south-west portion of the table-land. Gradually pushing eastward and northward, as their numbers increased, either rapidly by additions from without, or more slowly by increase of the population from within, they ascended to the various valleys as high as Kalat, when, discovering the great eastern outlet, the Moolla pass, they found an exit by it into the plains of India. How long they remained on the table-land, from whence they originally came, and over what countries they eventually distributed, are alike mysteries. There are one or two points of slight resemblance between the Pelagii, the builders of the Cyclopean walls of Egypt, and the ghorbasta builders, suggesting that they might have been a kindred people with kindred habits. The Pelagii came from Asia, not from Asia Minor, nor from Syria, not from Assyria, not from Persia, but probably from that birthplace of emigration, the tract north and north-east of Persia. The ghorbasta builders probably came from the same tract, and were not Makranis, nor Persians, nor Assyrians. The Pelagii existed only a few generations in Greece (about 400 B.C.), before they were turned out by the Hellenes; they must therefore have brought with them when they entered the country their propensity for building massive walls, and commenced their work almost immediately on arrival.
GHOU.D. Pers. According to superstitious belief in Persia, a fair woman of about twenty years of age, that preyed at night on dead bodies. The ghoul-i-blan, or ‘demons of the desert,’ are also described as a hideous race, that particularly infest a dreary tract in the north of Persia, not far from Shiraz, bearing the portentous name of Malik-al-Mout Darrah, or ‘Valley of the Angel of Death.’ The ghoul resembles the Boddach of the Scotch Highlanders.

GHOUS-ul-AM, the title of Abdul Kadar Ghilani, q.v.

GHRAB or Grab. Arab. A sea-going vessel trading between the Malabar coast and Arabia.

GHUGREE, hollow rings with pebbles in them, worn on one or both thumbs, and rattled.

GHULAB SINGH, a maharaja, the first ruler of Kashmir, a Dogra Rajput; died on the 2d August 1857.

GHULAM. Arab. A slave, a servant; a term in frequent use by persons to indicate their readiness to obey, as ‘Main ap ka Ghulam hun,’ I am your slave; also often used as a part of a name, as Ghulam Ali; Ghulam Hasan, Ghulam Mahomed, servant of Ali, Hasan, Mahomed, etc.

Elliot considers that in this word we have the origin of the English gallant, galantry, gala, etc., Ghulam being derived from the Arabic Gh’t’m, libidinosus, and hence it signifies a comely youth, one chosen as an attendant or page for his personal endowments. The Spaniards borrowed it from the Arabs, and called a handsome young man Galanta, from which are derived Galante, Galanteria, all subsequently adopted into the European tongues through the influence of the amatory poetry of the troubadours. In Persia, Ghulam is now applied to an inferior civil officer or policeman, answering to a cavass in Turkey. Several of these are attached to each European embassy in Persia. The Shah has also a number attached to his person, who are called Ghulam Shah; these form a kind of bodyguard. The Russians use their Ghulam only for posting purposes, to accompany members of the embassy, and have a body of Cossacks for escort; the British embassy Ghulams are used for escort, and also for posting purposes, the regular native Indian cavalry who used to form the escort of the British ambassador having been discontinued during the mission of Sir Gore Ouseley, which lasted from 1812 to 1818.

In Persia the Kooleragassee is the superior of the slaves. Each of the princes, as well as the king, has a certain number of confidential troops, who act as guards or agents on all important occasions, and who are called Ghulam or slaves.—Elliot; Fraser’s Khorasan, p. 105; Perrier’s Journ., p. 21.

GHULAM HUSAIN of Zaidpur, author of Raz uSulatin, a Persian history of Bengal, up to A.D. 1787-88.

GHULAM HUSAIN KHAN, a Mahomedan noble of Bengal, author of the historical work, Siyur-ul-Mutaksahirin, a history of India from A.H. 1118-1195, A.D. 1706-1782.

GHULAM KADAR, a Rohilla chief at Dehli, who in 1788, learning that Shah Alam II. was to remove him from court, surprised the palace, maltreated and tortured the emperor, maltreated the children before the emperor’s face, ordered the emperor’s eyes to be pierced,dishonoured the ladies of the court, and gave up the palace and city to pillage. He fled, and at length, galloping alone from a fort in which he had taken refuge, his saddle stuffed with plunder, he was thrown from his horse, and picked up by his pursuers, the Mahtrattas, who deprived him of his limbs, and exhibited him in Dehli in a cage, in which he perished. It is said that he himself with his dagger destroyed the emperor’s eyes.

GHULGHELEH, a city in ruins, south of Baman, destroyed by Chengiz Khan. It is in the valley of Baman, and Cufic coins are occasionally dug up in it.—MacGregor. See Gulghula.

GHUMAO, HIND., properly Kahnman, a land measure in the Panjab. A pair of good oxen will plough a ghumao in twenty-four hours.

GHUN. HIND. A destructive weevil that attacks wood and gram, the Calandra granaria. Ghungi, an insect that destroys growing grain.

GHIJGOL, also Ghangol, the water-lily which produces the celebrated Nefolar or lotus flower. It yields a greenish fruit about the size of an orange; its seeds are eaten by the poorer classes.

Elliot.

GHURYAN is situated in a level plain, with numberless plants of asafetida. The Kakar, an Afghan tribe, come up in swarms with their families, and disperse themselves over the plain. They make longitudinal incisions along the stalk, and then protect the asafetida plants with small pieces of clay or bricks, to keep off the rays of the sun. A dark-coloured secretion oozes from the plant, and congeals over the fence stones. The people, with small bags of skin hanging to their necks, collect the asafetida. The asafetida plant is nearly five feet high, and has large leaves.—Mohan Lal’s Travels, p. 278.

GHUZZ, The Mameluks of Egypt were known by this name. Yomut, Goklen, Chaudar, and Imralli have dwelt from time immemorial in the steppes between the Caspian and Derajat. They are a warlike people, skilled in horse craft, and unlike the others in dress and language.

GIBRALTAR, a city in ruins, south of Baman, destroyed by Chengiz Khan. It is in the valley of Baman, and Cufic coins are occasionally dug up in it.—MacGregor. See Gulghula.

GHUMAO, HIND., properly Kahnman, a land measure in the Panjab. A pair of good oxen will plough a ghumao in twenty-four hours.

GHUN. HIND. A destructive weevil that attacks wood and gram, the Calandra granaria. Ghungi, an insect that destroys growing grain.

GHIJGOL, also Ghangol, the water-lily which produces the celebrated Nefolar or lotus flower. It yields a greenish fruit about the size of an orange; its seeds are eaten by the poorer classes.

GHUZZ, The Mameluks of Egypt were known by this name. Yomut, Goklen, Chaudar, and Imralli have dwelt from time immemorial in the steppes between the Caspian and Derajat. They are a warlike people, skilled in horse craft, and unlike the others in dress and language.
the bulk of the cargoes of the Chinese junks on their return voyages. It is much used as a size for stiffening silks, and for making jellys. The quantity shipped from Singapore is about 10,000 pikuls annually. Though deserving of being better known, it does not appear to be an article of Indian import, or, if so, it is brought in under some other name.—Hon. A. Morrison; Exhib. Jor. Reports and Catalogues; Stamford; Tondalson; Williams' Middle Kingdom, p. 275. See Ceylon Moss; Edible Sea-weed; Gigartina tenax.

GILL. Pers. Earth, clay.

Gili-i-Abrorash, a rough, hard, not brittle, pink earth, only used in native medicine; properly speaking, a deposit from a mineral spring containing sulphur. The sediment is collected and made into little cakes. But the Hasan dhup ordinarily seen in the bazar is a mere imitation, consisting of some earthy clay mixed with ground sulphur and formed into cakes, called probably Moses' Stone, from its lamellar structure, as if the tables of the law given on Sinai had been on slate tablets.

Gili-i-Farsi, a pink earth.

Gili-i-Irmuni, Armenian bole, not now used in European medicine, but formerly so employed, and still used by natives.

Gili-i-Khardiya, a red earth.

Gili-i-Kiria, a soft, laminated, nearly white clay, resembling chalk in appearance, hence probably the name.

Gili-i-Makhitum, a soft, rough, irregular, variegated marl, containing clay, deeply coloured by peroxide of iron, mixed with nearly white carbonate of lime.

Gili-i-Multani, fullers' earth. A soft, laminated white or pale yellow earth, used by the natives for cleaning their hair, and in medicine.

Gili-i-Safed, chalk, Carbonis carbonas.

Gili-i-Zard, a pale yellow, tough, laminated earth, intermediate in colour between geru and gili-i-Multani, but resembling both in appearance.

Powell.

GIL, a cultivator race E. of Ferozpur, who claim to be offspring of Jat mothers and Rajput fathers.

GILAUDWA. Hind. The flower of the Bussa latifolia, after it has fallen off. When the flower falls off, the pod or gula forms, and from this a useful arrack is prepared.

GILCHRIST, JOHN BORTHWICK, I.L.D., M.D., born 1759 in Edinburgh, a medical officer of the Bengal army, who distinguished himself as an oriental scholar. He wrote a dictionary and grammar of the Hindustani language, and other books in that tongue. He formed the Hindustani or Urdu tongue. His attempt to form a universal writing character, in his 'Missionary's Portable Christmas-Box' and Cosmopolitan's Seasonable New Year's Gift,' did not succeed; and up till this time it continues a matter of discussion whether in the efforts to diffuse knowledge by means of printed books, the writing characters in use by the peoples of the south and east of Asia should be continued, or whether the Roman letters should be employed to represent them. He bequeathed property for educational purposes, which is being applied as scholarships. He died in 1841, nearly 82 years of age.

GILEAD, a broad belt of country lying between the river Jordan on the west and the great Syrian desert on the east.
GILGIT.

GILGIT, a territory in High Asia, in lat. 35° N., and long. 74° E. The Indus river runs through it from N.E. to S.W. It is on the southern declivity of the Hindu Kshu, between Chitral on the west and Baltistan (Little Tibet) on the east. In the Bunnu valley there are intermixed races, of whom may be noticed the Dardu of Gilgit and Chulas. According to Burnes, the mir of Badakhshan, the chief of Darwaz in the valley of the Oxus, and the chiefs eastward of Darwaz who occupy the provinces of Kulub, Shughman, and Wakkan, north of the Oxus, also the hill states of Chitrail, Gilgit, and Iskardo, are all held by chiefs who claim a Grecian descent. The whole of the princes who claim descent from Alexander are Tajaks, who inhabited the country before it was overrun by Turki or Tartar tribes. To the west beyond Balti, the people of Astor, Gilgit, and Hunza-Nagar speak different dialects of Dardu, while the Kashmiri people have their own peculiar language. The Balti people of Little Tibet say that Ladakh, Iskardo, Khojalu, Purik Nagyr, Gilgit, and Astor are distinct Tibet. –Burnes' Bokhara.

GILL, MAJOR ROBERT, an officer of the Madras army, who devoted nearly twenty years of his life to copying and photographing the fresco pictures in the caves of Ellora and Ajunta. His devotion, in dwelling in such lonely spots as in the ravine of Ajunta, is unparalleled in modern times. He died at Bhosa vul on April 10, 1879, aged about 76. He received his commission in 1824, and was invalided on a brevet-majority in October 1852. He was a noted shikari, and a no less celebrated artist. Several of his copies of the paintings of the Ajunta caves, for which the East India Company liberally rewarded him, were unfortunately destroyed in a fire that took place at the Crystal Palace. His son, Captain Gill, R.E., who travelled across China, was murdered in Arabia in 1882, along with Professor Palmer.

GILLAR. HIND. Goatire. Gillar pat or Gillar-ka-patta, a sea-weed Laminaria, sp., used as medicine for goitre. It is obtained solely via Yarkand from the shores of the Caspian Sea. Five or six maunds are imported. The word Patr is a leaf. Dr. Martin Honigberger refers Gillar-ka-patta to Laminaria saccharina, and alludes to a belief that it is found in a salt lake in Tibet, adding that some English physicians maintain it is brought from the Caspian Sea. He says it is useful in scrofulous ulcers in horses.—Powell's Handbook.

GILLESPIE. General Rollo Gillespie, an officer of the British army who served in the West Indies, the East Indies, and the Eastern Archipelago. On the occasion of the Vellore mutiny of 1806, he was in command of Aroet, and Sir John Fancourt was in command of Vellore. They were very intimate, having been quartered together at St. Domingo. Gillespie had been invited to dine and sleep at the quarters of Sir John Fancourt, on the very night the mutiny occurred (8 A.M. 10th July), so little was their suspicion of the fidelity of the sepoys. Just as he was about to start on the morning of the 9th July, public despatches were put into his hands, which compelled him to defer his journey; but at daybreak on the 10th July he mounted his horse to gallop overland to Vellore in time for breakfast, and was scarcely in his saddle when tidings arrived of the massacre. A troop of the 19th Dragoons was at the time ready for parade. Gillespie ordered them to get ready for the rescue of their countrymen. The 16 miles were soon covered; Gillespie had outstripped his escort, and was attracted by the sound of musketry to a lofty gateway and bastion, where the remnant of the British still stood at bay, their last cartridge almost expended, when Sergeant Brodie, who had known Gillespie at St. Domingo, saw a horseman spurring across the plain, and, turning round to his comrades, said, ‘If Colonel Gillespie be alive, here he is at the head of the 19th Dragoons; and God Almighty has sent him from the West Indies to save our lives in the East!’ A rope, made of soldiers’ belts knotted together, was let down the ramparts, and Gillespie dragged up another a Glasgow. The dragoons with their galloping guns (light field-pieces used by cavalry regiments in those days) blew open the gates; a British ‘huzzza’ was heard, accompanied by the rattling of horses’ footsteps over the drawbridge, and the mutineers were charged. Some 300 or 400 were cut to pieces, many were taken prisoners, and others escaped by dropping from the walls. Fancourt only lived to see the ensign of Mysore cut down, and the British standard once more float on the ramparts of Vellore. He died that afternoon, having been shot down by some sepoys when trying to join Brodie’s main guard. ‘Lady Fancourt and her two children escaped, through the faithfulness of their servants and the timely arrival of Gillespie. The members of Tipa’s family who were the chief instigators of their servants, were removed to Calcutta. Colonel Gillespie next went through active service in the subjunction of the Spice Islands. The last scene in which he acted was the Gurkha war. He was shot through the heart on the 31st October 1814, while waving his hat and leading his men on to the first fortified position he met at Kalunga, in Nepal.

GILLOLO is one of the Molucca Islands. Its north end is in about lat. 2° 23’ N. It has a long mountainous coast, high bold land, with three remarkable peaks. The indigenes live in the north of the island. Their stature, their features, as well as their dispositions and habits, are almost the same as those of the Papuan. Their hair is semi-Papuan, always crisp, waved, and rough, such as often occurs among the true Papuans but never among the Malays. Their colour alone is often exactly that of the Malay, or even lighter. In most cases, the large, somewhat aquiline nose, with elongated apex, the tall stature, the waved hair, bearded face and hairy body, as well as the less reserved manner and louder voice, unmistakably proclaim the Papuan type. Here is the exact boundary between the Malay and Papuan race. It is only in the Northern Peninsula that these Papuan indigenes exist, the whole of the rest of the island, with Batechan and the other islands westward, being exclusively inhabited by Malay tribes like those of Ternate and Tidore. The Galela race are natives of a district in the extreme north of Gilolo, but they are great wanderers over the Archipelago. They are a very fine race, remarkably energetic and industrious, of light complexion, tall, and with Papuan features, coming near to the drawings and descriptions of the true Polynesians of Tahiti and Owyhee. They build large and roomy prahu with outriggers, and settle on any coast or island they take a fancy for.
They catch turtle and trepang, hunt deer and wild pigs and dry the meat, and cut down the forest and plant rice or maize. Pitta gigas, a large ground thrush of Gilolo, is one of the most beautiful birds of the East. Its plumage is a velvety black above, breast of pure white, shoulders of azure blue, and belly of vivid crimson. Charcoonya placintis of Gilolo is one of the smallest and most beautiful Gilolo-breasted thrushes.

Coelia d'Urvieille, a rare and beautiful day-flying moth.—Horsburgh; Bikmouro; Wallace, ii. pp. 2, 3.

GINGAR. Hind. An insect that destroys growing grain and pulses.

GINDING, a wind in East Java, occasioned by the S.E. monsoon blowing right over the land through the gap at Klakka, 1000 feet above the sea, between the Jyang and Tenger mountains, 8000 and 9000 feet high.

GINGEE, Ginji, or Ghinji, in the S. Arcot district, in lat. 12° 15' 19" N., and long. 79° 26' 8" E., a town and fort 35 miles N.W. of Pondicherry. In the contests between the rival French and British, and rival Mahratta and Mahomedan princes, Gingee and neighbourhood were frequently scenes of strife, and it long continued a French possession. In the 17th and 18th century it was taken by Sivaji, was attacked by Aurangzeb, stormed by the French, but finally occupied by the British. The French obtained the grant of Pondicherry in 1674, from a raja of Gingee who acknowledged the king of Narsinga as his superior; but this latter was at the same time dependent on Visapar. Sivaji took possession of Gingee about the year 1677, and confirmed the above grant in 1680.—Rennell's Memoir.

GINGELLY OIL, Sesamum Oil.

Jiritch, Nall-samai, Manchii-mas, Pers.

Gingelly Seed, Sesamum Seed.

Gingelly is the commercial name for the Sesamum orientale. Three varieties of the plant are cultivated in India,—the white-seeded (Saffed-till), the red or parti-coloured (Kala-till), and the black variety (Tilice). It is the last which affords the greater proportion of the gingelly oil of commerce. A sort of sesame oil sometimes called rape, is obtained from the red-seeded variety. Black sesame is sown in March, and ripens in May. Red sesame is not sown till June. The black-seeded variety (Tilice) affords a larger percentage of oil than the red-seeded kind. It is extensively cultivated in Southern Asia for the oil expressed from the seeds, which are slightly oval, small, tasteless, and inodorous. The varieties of seed possess the same properties, and in commerce are met with in both a mixed and separate state. Gingelly seed is largely exported to England and France, and the oil is perhaps consumed to a greater extent than any other by the natives of India, and is second only to coconanut oil in its importance as an article of commerce. The great disparity of colours observed in this oil is attributed to the mode of preparation. The method sometimes adopted is that of throwing the fresh seeds, without any cleansing process, into the common mill, and expressing in the usual way.

The oil thus becomes mixed with a large portion of the colouring matter of the epidermis of the seed, and is neither so pleasant to the eye, nor so agreeable to the taste, as that obtained by first repeatedly washing the seeds in cold water, or by boiling them for a short time, until the whole of the reddish-brown colouring matter is removed, and the seeds have become perfectly white. They are then dried in the sun, and the oil expressed as usual. This process yields 40 to 44 per cent. of a very pale straw-coloured, excellent substitute for olive oil.

In India the oil is chiefly used in cookery, in anointing the person, for making soap, and for burning in lamps. In England it is chiefly used for the manufacture of soap, and for burning in table-lamps, for which it is better suited than coconanut oil, owing to the lower temperature at which it congeals. In different parts of the Madras Presidency the price of this oil varies from Rs. 1 to Rs. 6 per munday of 25 lbs. Til or gingelly seed exported from India, chiefly to France, and from Bengal and Bombay:—

GINGER, Zingiber officinale.

Zangebil, Arab. PERS. Zengibre, ZYNGZ, Zengiber, BENG. Zingiber, MALAY. Zigenber, MALAB. Gengivre, PORT. Giner, NED. Gengibre, ESP. Jinger, GER. Adrek (green), HIND. Sont (dry), TURK. Zengebi, I. Zinzero, JAY. Jasaiaking, also Jait, JAV. Ada (green), BENG. Singapades, also Ayla, MALAY. Khyengkhyuk (gre.), BUR. Khyeng-kiyuin (dry.), IND. Singhp, PORT. Ban, Can. Sunthi, Singareva, SANSK. Gember, DUT. Inghuru, SINGH. Gemberine, Fr. Ingarenbure, AGR. Ing, GER. Inji (green), Shukku, TAM. Shanti, TEL. Sout (dry), Zenjefli, TURK.

Dr. Royle thinks that the Sanskrit name Singareva is the source of many of its names.

The ginger plant is cultivated in the tropical regions of Asia, America, and Africa. In India it is generally cultivated in gardens, being sown about the commencement of the rains, in beds of about six feet square, and in a rich soil. The planting consists in dividing part of the green root, which the natives first soak in a mixture of cow-dung and water: it is then planted in rows two inches deep and about one foot apart. It requires a great deal of water, and to be kept clear of weeds. When the stalks dry, the ginger may be taken up, although it is sometimes left in the ground for one or two years. It is better for remaining twelve months, and must be watered during the dry season. The stem reaches generally three or four feet in height, and is renewed yearly; while the root, which is the part known as ginger, botanically termed a rhizome, is biennial. In Jamaica the roots are dug up in January or February when about a year old, and after the stems are withered. They are well washed, freed from dirt, and in some cases, especially with the better kinds, the epidermis or outer coat is stripped off; and hence the division of ginger into white, scraped, or uncoated, and into black, unscraped, or coated. In estimating the quality of ginger, a variety of particulars are taken into consideration, as whether the rhizomes are coated or uncoated, their form, colour, and consistence.

Out of 21 samples of the gingers sold in London, 15 were found by Dr. Hassall to be

1205
adulterated with sago meal, potato flour, wheat flour, ground rice, cayenne pepper, mustard seeds, and turmeric powder in various quantities, but in the majority of cases constituting the principal part of the article. A great part of that found in the shops had been washed in whiting and water, under the pretence of preserving it from insects. The dark-coloured kinds are frequently bleached with chloride of lime.

Great Britain imported 33,854 cwt. in 1870, and 32,000 cwt. in 1871. Ginger exported from India—

The Malabar ginger exported from Calicut is the produce of the district of Shennad, situated in the south of Calicut, a place chiefly inhabited by Moplas, who look upon the ginger cultivation as a most valuable and profitable trade. The soil of Shennad is so very luxuriant, and so well suited for the cultivation of ginger, that it is reckoned the only place in Malabar where the plant grows and thrives to perfection. The only suitable kind of soil is that which, being red earth, is yet free from gravel, and the soil good and heavy. The cultivation generally commences about the middle of May, after the ground has undergone a thorough process of ploughing, harrowing, etc. At the commencement of the monsoon, beds of ten or twelve feet long by three or four feet wide are formed, and in these beds small holes are dug at three-fourths to one foot apart, which are filled with manure. The roots, hitherto carefully buried under shades, are dug out, the good once picked from those which are affected by the moisture, or any other concomitant of a half-year's cultivation from the atmosphere, and the process of clipping them into suitable sizes, for planting performed, by cutting the ginger into pieces of an inch and a half to two inches long. These are then buried in the holes, which have been previously manured, and the whole of the beds are then covered with a good thick layer of green leaves, which, whilst they serve as manure, also contribute to keep the beds from unnecessary dampness, which might otherwise be occasioned by the heavy falls of rain during the months of June and July. Rain is essentially requisite for the growth of the ginger; it is also, however, necessary that the beds be constantly kept from inundation, which, if not carefully attended to, entirely ruin the crop.

Great precaution is therefore taken in forming drains between the beds, and letting water out, thus preventing the superfluity. One constant of the great tendency some kinds of leaves have to breed worms and insects, strict care is observed in the selection, and none but the particular kinds used in manuring ginger are taken in, lest the wrong ones might fetch in worms, which, if once in the beds, no remedy can be resorted to successfully to destroy them, and thus in a very short time they ruin the crop. Worms bred from the leaves laid on the soil, though highly destructive, are not so pernicious to ginger cultivation as those which proceed from the effect of the soil. The former kind, whilst they destroy the beds in which they once appear, do not spread themselves to the other beds, be they ever so close; but the latter kind must of course be found in almost all the beds, as they do not proceed from accidental causes, but from the nature of the soil. In cases like these the whole crop is oftentimes ruined.

The present mode of preparing the land for this crop in the West Indies, is by first carefully hoeing off all bushes and weeds from the piece intended to plant; the workmen are then placed in a line, and dig forward the land to the full depth of the hoe, cutting the furrow not more than from five to six inches thick. The land is then allowed to pulverize for a short time; it is then prepared for receiving the plants, by opening drills with the hoe, from ten to twelve inches apart, and the same in depth, chopping or breaking up any clods that may be in the land. Two or three women follow and drop the plants in the drills, any from nine to ten inches apart. The plants or sets are the same size as for fingering out the original root, as not worth the scraping. The plants are then covered in with a portion of the earth-bank formed in drilling. Great care and attention is required to keep them clean from weeds until they attain sufficient age. They throw out a pedicle or footstalk in the course of the second or third week, the leaves of which are of similar shape to that of the Guinea grass.

Ginger is very liable to rot, particularly if planted in too rich a soil, or where it may be subject to heavy rains. The general average of yield is from 1500 to 2000 lbs. per acre in plants, although as much as 3000 lbs. of ginger have been cured from one acre.

Ginger Preserve is made from the young shoots put forth every spring by the perennial rhizome. These shoots are carefully picked, washed, scaled, scraped, peeled, and then preserved in jars with syrup. Dried ginger of good quality, soft and moist, may be converted into excellent preserved ginger. The rhizomes, selected with care, are to be immersed for three or four weeks in very weak syrup, scarcely stronger than sugar and water, to which a small portion of the carbonate of potash has been added. As soon as the ginger has become sufficiently soft, it is put up in very strong syrup of white sugar. Ginger preserve is imported into India solely from China, in cases containing half-a-dozen of jars each, the capacity of each jar being about 5 lbs.

—Dr. P. Browne; Poole’s St. of Commerce; Mason’s Tenn.; Hassall’s Food; Riddle’s Gardening; M’C. Dict.; Faulkner’s Diet.; Simmonds.

GINGERBREAD TREE, or Doom palm of Egypt, is the Hyphane Thebaica (Cucifera Thebaica), and receives its name from its fruit having the look and taste of gingerbread. It is stated by Dr. Lindley to produce the balsam. Its wood is used for various domestic purposes, and its kernels turned into rosaries.—Semen.

GIN-RIKSHA. Jap. Literally, man-power carriage, a small two - wheeled conveyance, dragged by two or more coolies.

GINGSENG. ANGLO-CHIN. The famed ginseng substances are known to the Chinese as Jin-san, Liau-san, Hwang-san, Shin-tsan, Kwan-tung-jin-san, and Kwan-si-jin-san. The Dutch call it Kraft Wurzel, and the Tartars, Ohrota. That obtained in the provinces of Shen-si, Pechi-hi, and Shing-king is the product of the Panax ginseng, Meyer. A part of this drug is obtained from the Nepal plant, Panax pseudoginseng, Wallich; and the P. quinquefolium.
which is largely used in Central China, is the American ginseng. The Shing-king plant, called Kwan-tung-jin-san, is almost an imperial monopoly. A plant called Tang-san, which seems to be cultivated in Corea or Peli-chili, and substituted for the true ginseng, seems to be a species of Campanula or Adenophora. Corean ginseng ranks next after the Kwan-tung-jin-san of Manchuria,—in fact, constitutes the only available drug in the hands of traders. This, however, is often adulterated with Japanese ginseng, which again is often adulterated with roots of Campanula glauca, etc. The Manchuria wild ginseng is carefully searched for by the Manchu. The pieces, after careful trimming with a bamboo knife, and drying in still air, are made to assume something of the form of the human body or miniature human hand. They are yellowish, semi-transparent, firm, brittle to some extent, and of a sweet mucilaginous taste, inclining to bitterness. It is easily injured by damp and worms, and great care is taken to preserve the true Manchurian plant. It is prepared as an extract or as a decoction, and always in silver vessels. It is preserved in almost every kind of disease of a severe character, but the stage of each disease in which it is administered is carefully distinguished. It is given in all forms of debility, spermatorrhoea, asthma, hemorrhages, severe dyspepsia, vomiting of pregnant women, chronic malarious affections, and the typhoid stages of epidemic fever; and its effects apparently are of an alternative, tonic, stimulant, carminative, and demulcent nature.

Dr. Smith observes that some positive efficacy of a sustaining character does really exist in this species of ivywort. The leaves are sold in bundles, and are said to be emotive and expectorant.

The ginseng that comes to Shang-hai, chiefly from Corea and Tartary, is carefully protected from the air, and sells at from 6 dollars to 500 and even 400 dollars the ounce.

Ginseng, Bastard, Shang-tung-jin-san, Chin., Tang-san, Chin., is obtained from the roots of several species of Adenophora, Campanula, Phyteuma, and Platycodon, which are largely used to adulterate and as substitutes for the genuine ginseng; but the Japanese seem to prize the roots of Campanula japonica as highly as the true ginseng. Also the virtues of the true ginseng are exhausted, and the now worthless root re-sold. Plants of Shan-si and other Chinese provinces, called by the Chinese Tang-san, also Fang-tang-san, also Lu-tang, also Ch'uen-tang, and Ming-tang, are often substituted for ginseng.

Ginseng, Black.

Hsien-san; Hiten-san, Chin., | Yuen-san, | Chin.

This Chinese plant is grown in Ho-chau (Nan-kwang), and in the N. and N.N. provinces of China. Its black fleshy roots have some resemblance to ginseng; taste raw and sweetish, with little odour, though used by incense-makers.

Ginseng, Extract of, Jin-san-kau, Chin., is carefully prepared in silver vessels. It is used to make the Tseal-tanu-hwan, or regenerating pills, sold at two taels a-piece in Hankow.—Smith; Williams; Middle Kingdom, p. 281; Sim. Com. Pro. 436-57; Hon. Mr. Morrison's Comp. Des.; Lockhart, 109.

GIRAFFA CAMELOPARDALIS.

The giraffe, one of the Ruminantia, has persistent horns in both sexes; the horns are covered with a hairy skin, with a tuft of hair at the tip. Lip not grooved, entirely covered with hair, much produced before the nostril; tongue very extensive; neck very long, body short; hinder legs short, false hoof none; tail elongate, with a tuft of thick hair at the end.—Eng. Cyc.

GIRAH. Hind. A knot, a division of a gaz.

Gin-gah, the knot made annually on a birthday.

GIRAR, 36 miles S.E. of Wardiah district, is famed for the shrine of Shaikh Khaja Farid. It is on the top of the hill close by, and attracts a continual flow of devotees, Hindo as well as Mussalman. He was born in Hindustan, and, after wandering about for some thirty years as a fakir, he came and settled on the Girar hill about the year A.D. 1244. There is a belief that the zeolites on the Girar Hills are petrified cocoanuts and other articles of merchandise belonging to two traversing traders, who mocked the saint, on which he turned their whole stock-in-trade into stones as a punishment.

GIRARDINIA LESCHENALDITIANA.

Urtica heterophylla, Zech.

Neilgerry nettle, | Eng. | Ana shorigenam, Maleal.

Grows in the Konkans, the Peninsula, Nepal, and is frequent all over the higher range of the Neilgherries. The bark yields a fine, strong, white, flax-like fibre, which the hill people obtain by plunging the plant into hot water, to deprive it of its virulently stinging properties, and then peeling the stalks. The textile material so prepared is of great strength, and the Todawar use it as thread. It is worth £200 a ton in England.—M. E. J. R.

GIRASI, a predatory, piratical race on the Maharrata coast, qu. Grassia.

GIRBAR. In Oman, the hides of the sheep or goats are made into leather vessels, called Girbar. Those of kids or lambs serve for milk, while the larger are used for either wine or water. They are tanned with the bark of the acacia; and the hairy part, which is left without, is generally, though not invariably, cleansed. The apertures through which the legs protruded are closed up, and the fluid within is discharged through the opening of the neck, which is gathered together and fastened by means of a leather thong, its extremity being cut in the form of a tongue or spout. They are slung alongside their camels; and a Bedoulain, when thirsty, may frequently be observed drinking from them whilst in that position. They answer better than jars, because, if the camel run against trees or its fellow-beasts in the caravan, they are not liable to be broken, and from the evaporation constantly going on, the water is also kept cool; but whilst new, sufficient attention is not paid to cleansing them, and their contents thus acquire a loathsome taste and smell. CalledT. 1. 89.

GIRDAVUREE, also written Girlawnee, Patrolling, inspecting, going the rounds, from the Persian Gurd, circuit, circumference, and Aordan, to bring.—Elliot.

GIRDHANA, a sacred hill in Vrij, from which Krishna derives one of his principal epithets, Girdhan or Girdhunath. 'God of the mount of
GIRDLES.

GLACIERS.

wealth." Here he first gave proofs of miraculous power, and a cave in this hill was the first shrine, on his apotheosis, whence his miracles and oracles were made known to the Yadu race. From this cave (Gopha) is derived none of his titles, Gophnath, 'Lord of the cave,' distinct from his epithet Gopinath, 'Lord of the Gopi,' or pastoral nymphs. On the annual festival held at Girhdana, the sacred mount is purified with copious oblations of milk, for which all the cows of the district are in requisition. The worship of Krishna in ancient days, like that of Apollo amongst Greeks, was chiefly celebrated in caves, of which there were many scattered over India. The most remarkable were those of Girhdana in Vrij, Gaya in Bahar, Gophnath on the shores of Saurashtra, and Jalindra on the Indus.—Tod, i. p. 545.

GIRDLES are worn by Mahomedans and Hindus. They are alluded to in the Bible, Psalm cix. 19, 'Let it be unto him as a girdle wherewith he is girded continually;' Daniel x. 5, 'Whose loins were girded with the fine gold of Uphah.' Many of the Hindus, both men and women, wear a silver or gold chain round their loins; and all Mahomedans in full dress wear a muslin girdle, called a kamband or loin-girdle: Psalm xciii. 1, 'Strength wherewith he hath girded himself.' When an Asiatic is about to set off on a journey, to lift a burden, or to do something which requires exertion, he binds firmly his loose upper garment round his loins.

GIRI, Pabur, and Tons rivers are tributaries of the Jumna, and up the valley of the GirI to Kotkai there is a great consumption of wood and charcoal in connection with the iron-smelting, for which that locality is famous.—Clep. Panj. Rep.

GIRNAR, in lat. 21° 30' N., long. 70° 42' E., a hill 3500 feet high, near Junagarh in Kattyawar, and 40 miles to the north of Somnath. The Jaina religionists regard it as sacred, only second in importance to Palitana, and it is also reverenced by Hindus. Of the holy objects on and near it may be mentioned, a rock at the foot of the hill outside the town, and which is covered with a set of Asoka's inscriptions, 250 B.C. Another inscription (150 A.D.) relates how the local ruler, Rudra Duma, defeated the king of the Dekhan; while a third (457 A.D.) records the bursting of the embankment of the Sudarsana tank, and the rebuilding of a bridge which was destroyed by the flood. The principal group of temples at Girnar is situated on a ledge, about 600 feet from the summit, and nearly 3000 feet above the level of the sea. The largest, and possibly the oldest of these, is that of Neminath. About 2700 feet above the sea, and 2500 above Junagarh, are a series of Jain temples on a ledge of the mountain. In a small under-group of the Jain temple of Amba Jhara, or perspiring idol. The meaning of this is unknown, but it is supposed to be Amrit-juhara, or nectar-drop. On the highest peak at Kalaka is Amba Mata, the dread mother, the universal mother, called also Sri Mata Ambika. The famous Bhaiava Jhap, or death-leap, is near the Jain temples. It is a huge rock that rises on the edge of the ledge, and slightly overhangs the great precipice. The leap has been forbidden, though even now it is occasionally taken. The peak of Gorakha Natha rises about 3500 feet above the sea, and Datranya peak is almost the same height; it is sacred to Neminath, whose first convert was king Datatri. There are many ascetic devotees, and in the jungles below there were said to be some of the Agniva. The Jain temples on Girnar Hill are very elaborate and beautiful, much in the usual style of Hindu architecture. The most striking characteristics of their interiors are their fine tesselated marble pavements, their painted domes, their exquisitely shaped and carved pillars,—sometimes of granite and green sycamore,—their antique porticoes, beautiful small sculptures and colossal statues. The central dome of the temple to Neminath is curiously painted, and surrounded by female figures. It has beautiful marble pillars composed of alternate black and white marble.

GIRONNIERA RETICULATA, Thun., Kodtani, Tam., a large and valuable timber tree found in the Peninsula in the ghat forests, up to 5000 feet elevation, from S. Canara down to Travancore and Tinnevelly, also in Ceylon. The wood is very hard and heavy, and is a valuable engineering timber: Bot. Diction., Pl. Syl., p. 313.

GLACIERS are masses of ice which are formed and remain in the valleys and on the slopes of lofty mountains. In every part of the Himalaya and of Western Tibet, wherever the mountains attain a sufficient elevation to be covered with perpetual snow, glaciers are to be found. In the lofty chain of the Cis and Trans Sutlej Himalaya, and of the Kuen Lun, whose peaks rise to a very great height,
and collect in winter enormous depths of snow, the glaciers are of great length. In the central parts of Tibet, which are often lower, and even in their loftiest parts are less snowy than the bounding chains, the glaciers are of inferior dimensions. Where the snow-bed is at once cut off abruptly in an ice cliff, which can hardly be said to be in motion, or rather whose motion must be almost entirely from above downwards, moraines, which on the larger glaciers and among mountains of easily decaying rocks are of astonishing dimensions, form the margins of each glacier, and also occur longitudinally on different parts of their surface, increasing in number as the glacier advances, till at last the several series, whose origin can most be traced to the different ramifications of the glacier, become blended into one. En route to Kara-korum, after leaving the Nubra valley, when a sufficient elevation above his encampment had been gained, Dr. Thomson obtained a commanding view of the glacier which occupied the continuation of the main valley. It was nearly straight, and he guessed at least five or six miles long. The inclination of its surface was considerable. On each side, two or three lateral glaciers, descending from the mountains by which it was enclosed, contributed to increase its size, all loaded with heaps of stones, which had at the lower end of the central glacier so accumulated as completely to cover its whole surface. One day he proceeded along the end of the small plain close to which he had been encamped. On the right hand was an ancient moraine, which prevented him from seeing the road in advance. At the upper end of the plain he found a small streamlet running parallel to the moraine, and from the mouth of which his camp reached the end of a small glacier, from which the streamlet had its origin. Crossing the latter, which was still partially frozen, he ascended in a deep hollow between the left side of the glacier and the moraine. The icy mass had not yet begun to thaw, the temperature being still below freezing. After half a mile he ascended on the surface of the ice, and as soon as he did so, was enabled to see that the glacier had its origin in a ravine on the south, and entered the main valley almost opposite to him. The great body of the ice took a westerly direction, forming the glacier along which he had been travelling; but a portion formed a cliff to the eastward, which dipped abruptly into a small, apparently deep lake. At the distance of perhaps 500 yards there was another glacier, which descended from a valley in the northern range of mountains, and, like the one on which he stood, presented a perpendicular wall to the little lake. Right and left of the lake are tremendous piles of boulders, occupying the interval between its margin and the mountains, or rather filling up a portion of the space which it would otherwise have occupied. Into this very singular hollow he descended, on a steep icy slope, and, passing along the northern margin of the lake, ascended on the glacier beyond, as before, between the ice, and, on reaching the surface of the second glacier, he found that a similar but smaller depression lay beyond it to the east, in which also there was a small lake, with another mass of ice beyond it. This third glacier also came from the north, and was a much more formidable mass than those which had already been crossed. It was very steep, and was covered with snow, which was beginning to thaw more than was convenient. When at the highest part, he found that though apparently nearly level, it sloped downwards sensibly though very slightly, for nearly half a mile in an easterly direction. It was evident to him that he had now reached the highest part of the ascent, which he assumed to be 17,600 feet, and that the crest of the pass was covered by this glacier.

The existence of glaciers in Western Tibet was first made known by Vigne, who alludes to them in his Travels in Kashmir, ii. p. 285. Colonel Richard Strachey was the first who proved their existence, in 1847, in the Himalaya. On the northern side of the Kara-korum in and the Kuen Lun there are glaciers having forms identical with those of the Alps. Some of them are considerably larger than the glaciers in Europe. In the Himalaya the lowest glaciers go down to 10,500 feet,—the Pindari ending at 11,492 feet, the Tintunna at 11,430 feet, the Tsoji at 10,967 feet, and the Chaslu at 10,520 feet. In Western Tibet they descend to about the same elevation; thus the Mustagh to 11,576 feet, the Tap 11,508 feet, the Tami Chuet 10,460 feet, the Bepho glacier near Askoli, even to 9876 feet. The latter is worthy of notice as a remarkable case of low termination. In the Kuen Lun the glaciers end probably at heights not much differing from those in Western Tibet; at least, so may be inferred from the height of the snow limit, as also from the general appearance of the upper part of the glaciers. The glaciers on both flanks of the Elephi pass present, however, no instances of particularly deep descent.

Dr. Hooker could not discover any in the more eastern valleys, even so low as 14,000 feet, though at the hot season extensive snow-beds remain unmelted at but little above 10,000 feet. The foot of the stupendous glacier filling the broad head of the Thbok is certainly not below 14,000 feet, though being continuous with the perpetual snow (or névé) of the summit of Kinehinjigow, it must have 14,000 feet of ice in perpendicular height, to urge it forwards. Dr. Hooker made frequent excursions to the great glacier of Kinehinjigow. Its valley is about four miles long, broad and flat. Chang-o-khang rears its blue and white cliffs 4500 feet above its west flank, and throws down avalanches of stones and snow into the valley. Hot springs burst from the ground near some granite rocks on its floor, about 16,000 feet above the sea, and only a mile below the glacier, and the water collects in pools; its temperature is 110° F. and in part, 116°, or 4° hotter than that of the Yeum-tong hot springs, though 4000 feet higher, and of precisely the same character. A Barbarea and some other plants make the neighbourhood of the hot springs a little oasis; and the large marmot is common, uttering its sharp, chirping squeak. Dr. Hooker (ii. p. 7) found the moraines in the Sikkim valleys at 7000 or 8000 feet elevation. This would show either that the climate has changed, or that the mountain mass has become depressed equal to 8000 feet since the formation of the moraines.

In the Western Himalaya, in the Mustagh range, are two glaciers immediately adjoining one another, possessing a united length of 65 miles. Another in their neighbourhood is 21 miles long and from 1 to 2 miles wide. Its upper portion is 24,000 feet
above the sea-level, and its lower portion terminates in masses of ice 250 feet in height and 8 miles in breadth, and is 10,000 feet above the sea. Glaciers are called Gal by the Bhoutan.

There is a glacier in the valley of Brabaldo, in Little Tibet, a short distance from the village of Arindo. Its width is about 450 yards, and nearly a hundred feet high, and a large river flows with velocity from below it.

In 1839, Major A. Cunningham traversed a magnificent glacier which spanned the valley of the Cheli river, below the Kuli Debi pass (16,700 feet). It was fissured in all directions, and, looking down the main fissure, which was five feet wide, he saw the stream trickling at a depth of more than 300 feet. The surface was covered with hardened snow and embedded stones; but the mass, as seen in the fissures, was clear, transparent ice, filled with white specks. This glacier was about a mile long and a quarter of a mile broad, with an average depth of 200 or 300 feet. In the same range, Dr. Thomson saw a similar glacier to the north of the Saj pass, about 80 miles to the north-west of Kuli Debi. In 1847, Major Cunningham crossed a second and larger glacier to the north of the Parang pass, at 18,500 feet. It extended down the head of the Parang river for 22 miles. At its termination it was 50 feet high, but a quarter of a mile upward it was fully 150 feet thick.

Dr. Thomson observed a larger glacier on the northern side of the Umasi La, on crossing into Zangskar. It extended from the top of the pass, 18,128 feet, down to a level of 14,500 feet, and was not less than three or four miles in length. In two different parts of the Shuyak, above and below Sassar, seen by Dr. Thomson in 1849, the bed of the stream is completely spanned by enormous glaciers. The great glacier is about 30 miles below Sassar, and 20 miles above the junction of the Changchen-mo. Lieut.-Colonel Alexander Cunningham (Ladakh, p. 94), describing the Shuyak or Khunday river, a tributary of the Indus, which rises in the Kara-korum mountains to the northward of Leh, in lat. 35° N., and long. 75° E., tells us that in these cold and lofty regions almost every ravine is filled with a glacier; that since 1826 the channel of this river had never been clear, and the accumulated waters had formed a lake of considerable size, called Nubra-tho. This barrier has burst on three recent occasions,—in 1826, 1883, and 1841. In that of 1841, when the rushing waters reached Torbea, on the Indus, the river came down furiously in an absolute wall of mud, a horrible mass of foul water, carcasses of soldiers, peasants, war-steeds, camels, prostitutes, tents, mules, asses, tress, and household furniture, in one flood of ruin, for SYAM Singh Atarwala, of Raja Gulbu Singh's army, was encamped in the bed of the Indus at Kulathiree Coss, above Torbea, in check of Paimda Khan, and but that part of the troops were then in hot pursuit, the destruction would have been greater. Only those escaped who took at once to the mountain-side. Throughout the mountain course of the Indus, fields, houses, and trees were swept away, but man and the animals which he had domesticated generally managed to escape. The waters at 30 miles Indus below the junctions of the Shuyak, rose in an hour of 60 feet, and to 80 feet at Skardo.

Chorkonda, a glacier in Balti, in Tibet, is in lat. 35° 36' N., and long. 75° 58' E., and 16,300 feet above the sea.

Hsi-Genain, a glacier in Eastern Tibet, in height 22,260 feet English = 20,886 French feet.

Captain Godwin-Austen, 24th Regiment, writing in 1863 on the glacier phenomena of the valley of the Upper Indus, notices the glaciers in that part of the great Himalayan chain which separates Tibet from Yarkand, in lat. 35° to 36° N., and long. 76° E., and extending over an area about 100 miles from east to west, from Kara-korum peak No. 2 (28,265 feet), to the mountain of Haramosh. Glaciers supply the Hotse river, which joins the Indus opposite Kapelu. Those of the upper portion of the valley take their rise on the southern side of the peak of Masherbrum, and are about 10 miles in length.

The great Baltoro glacier takes its rise on the west of Masherbrum peak; on the north it is joined by a great ice-tender, which comes down from No. 2, opposite to it, from the north, and is another. Both of these extend 9 or 10 miles on either side of the main glacier. This, from its rise to its further end, measures 36 miles; its course is from E. to W.; the breadth of the valley along which it flows is 12 miles. It receives numerous tributaries along its course, some of which are 10 miles and more in length; two of them, on the N. lead up to the Mustagh pass into Yarkand (18,000 feet), whence a glacier descends to the N.E. about 20 miles in length.

The Nobandi Sbunudi glacier takes its rise from a broad ice-field which lies to the N. of lat. 36°, and has a S.E. course for 14 miles, with numerous laterals; it then turns S., when it becomes the stem of the Pummah glacier; about 5 miles from the termination it is joined by a glacier from the N.W., 15 miles in length.

The Biafo glacier is perhaps the most remarkable part of the Himalayan mass. It has a linear course of upwards of 40 miles; the opposite sides of the valley are very parallel along its whole length, and the breadth of ice seldom exceeds a mile, except where the great feeders join it from the N.E. From the summit-level of the Biafo Gause a glacier is continued westward to Isiper in Nayar, 28 to 30 miles in length.

The Chogu, which terminates at Arundu, takes its rise between the mountain of Haramosh and the Nushik pass; it is about 24 miles in length, with numerous branches from Haramosh, 8 miles in length.

The waters from all the glaciers, from that of Baltoro in the E. to Chogo in the W., are collected into the Shigar river, which joins the Indus at Skardo. All these glaciers carry great quantities of rock-detritus. The blocks on the Pummah glacier are of great size. There are groovings and moraines of a former extension of the glaciers in this region, showing that they have at times reached many miles beyond their present termination, and have risen upwards of 500 feet above their present levels. There are thick alluvial accumulations of the valley of the Indus, particularly in the neighbourhood of Skardo.

The glaciers and peaks of the Sassar pass in Nubra, Tibet, are shown by the brothers Schlagentweit to be in lat. 35° to 36° N., and long. 77° 27' to 36° E., and 17,763 feet above the sea. Colonel Markham, describing the glacier from beneath which the
GLADWIN, FRANCIS.

Ganges, says:—"I beheld it before me in all its savage grandeur, thickly studded with enormous loose rocks and earth. Extensive as my travels since this day have been through these beautiful mountains, and amidst all the splendid scenery I have looked on, I can," he says, 'recall none so strikingly magnificent as the glacier of the Ganges.'—Cunningham; Hooker; Thomson; Struchey.

GLADWIN, FRANCIS, author of a History of Hindostan during the reigns of Jehangir, Shah-jehan, and Aurungzebe, Calcutta 1788.

GLAM.—? A tree of Singapore; furnishes paper-like bark, used in caulking the seams of vessels. A similar substance occurs in Borneo, supposed to be the produce of a species of Arto-carpus.—Raffles, Fl. Pl. p. 341.

GLAPHYRIA, a genus of small trees belonging to the natural order Myrtaceae. G. nitida is called by the Malays the tree of long life, probably from its maintaining itself at elevations where the other denizens of the forest have ceased to exist. It affords, at Bencoolen, a substitute for tea, and is known by the name of the tea-plant. Various species of Leptospermum and Melalena bear the same name in the Australian colonies. G. sericea has lanceolate acuminate leaves. It is a native of Penang and the west coast of Sumatra.—Eng. Cye.

GLASS.

Kizaz, ARAB. Sheeshah, PERS.
Vite, Verre, Fr. Steklo, RUS.
Ran, Hind. Vidrio, SP.

Vitrum, Lat. Addamoo, TEL.

Glass imported into India consists of sheet and plate glass, glass beads and false pearls, common bottles, and other ware. Between the years 1874-75 and 1879-80 the value ranged from Rs. 28,07,405 in 1876-77, to Rs. 34,99,313 in 1875-76. The sheet and plate glass was valued at two to four lakhs, and the beads and false pearls at Rs. 6,85,314 to Rs. 9,69,595.

The basis of all glass is silica and alkali, of which the former, in the shape of common sand, is to be met with almost everywhere; the latter is to be had cheaply and in abundance in most parts of India. The secondary materials also, indirectly essential to the manufacture of the best quality of glass, namely the fireclays used in the construction of the furnaces, are abundant, and of very superior descriptions. Yet with all these advantages the natives do not appear to have advanced in the manufacture beyond the first and very rudest stages; and although it is one which, if successfully prosecuted, would probably meet with very extended encouragement, the manufacture of the commonest bottles is not yet practised. The chief defects of the native manufacture are the use of too large a quantity of alkali; in fact, in some cases, it is so much in excess, that it might be tasted by applying the tongue to the article. The fault now remarked upon is probably connected with and caused by another, that of the material being melted at too low a temperature and in too small bulk; and these again probably arise from the use of an improper furnace and an unsuitable kind of fuel. The native furnace is usually a rude hole dug in the ground, coated with ferruginous clay, which tends to discolour the glass, and the heat is raised by the use of bellows blast. Hence the tempera-

ture is confined to one point of the mass, and is insufficiently diffused; while the body of metal under fusion being small, and the dome and sides above ground being thin, the heat is dissipated from them, and never attains body and elevation sufficient to admit of the mass setting and purifying itself, or of its being freed from air-bubbles by the addition of the proper proportion of silica.

What is required is the preparation of the glass in larger quantities at a time, and with this view larger and more carefully constructed furnaces, on the reverberatory principle, to be heated by coal; after this, that the process should be attended to more scrupulously, and the materials mixed by weight, instead of being thrown together by measure, as is too commonly the case at present.

Country glass is usually made of diobhi's earth, a crude carbonate of soda, with a mixture of a little potash and lime 60 to 70 parts, and yellowish white sand 30 to 40 parts, composed of small fragments of quartz, felspar, iron, and a trace of lime. In 100 parts, for good bottle glass of Europe, are needed sand 58, sulphate of soda 29, lime 11 ½, charcoal 1 ½.

Sulphate of soda only contains 45 per cent. of alkali, so that 29 parts contain 13; while the carbonate of soda obtained from diobhi's earth contains between 30 and 40 per cent. of alkali, according to which the alkali used by the natives of India would be to that employed in Europe in the proportion of 29 to 13.

The substances generally used by the natives in colouring glass are iron, which gives green, brown, and black; mica, and manganese, of a pink, purple, and black; copper for blue, green, and deep; arsenic for white; and chromate of iron for a dull green. Bangles for the wrist are the chief articles now made in India, and some of the colours in the Bombay bazar are exquisite. The Chinese manufactures of porcelain, glass, and glazes, their carving and engraving of gems, Chinese agates, rock-crystals, and ivory, excite the admiration of Europe, as also does the Chinese and Japanese lacquer and varnish work.

The art of glass-making is yet in its extreme infancy in the Panjab. The glass sand occurs in the form of a whitish sand, mixed with an alkali, which effloresces naturally. It is there called roh; that only of a good white colour makes glass. This substance is identical with the alkaline efflorescence which appears in many parts, and whose presence is destructive to cultivation. Wherever such an efflorescence occurs over clean sandy soil, there is naturally formed a mixture of sand and alkali, which fuses into coarse lumps of bottle-green glass.

Glass Beads.
Kanch ke'manke, HIND. Munnie, TAM.
Butirsachi, MALAY. Pussali, TEL.

Coloured glass beads are largely worn in India by several non-Aryan races. Among the curious examples of persistence in art, are the Aggry beads which occur everywhere in Africa, and in many parts of Asia. They are considered to be of Phoenician origin, but are still made for the purpose of being bartered in Africa. They are usually large, not round but spindle-shaped, with alternate indented bands of red and blue, separated by a narrow white line.—Powell; Hooker; Raffles.

GLAUCUS, a genus of sea lizards. G. hexapterigius, Cey., occurs in the Indian and S. Pacific.
GLEDITSCHIA SINENSIS.

This is a beautiful flowering plant grows wild in the Siwalik range up to near the Jhelum, near Punjab, also at Ajjur and the Peninsulas of India and Malacca, and in Ceylon. It blossoms at the commencement of the rains. The large, flame-coloured drooping flowers proceed from the upper part of the stalks. The flowers are of a white, yellow, and orange colour, the petals long and fringed. It lasts about eight days, undergoing various changes during that time. The root, Mulim, also Kariart, is a strong poison. Loudon says, 'On account of the glorious colours of its flowers, and the elegance of their form, it is a splendid and curious genus. The flower, large as a lily, hangs down, and the petals, stamens, and style all turn and grow up like a flower turned inside out. Then, to complete the oddest, the leaves resemble their own extinctions into tendrils, and the plant walks on its toes.'

GLUE.

A small tree not uncommon in the Panjab of S. India and Siwalik tract up to near the Indus. The wood is only used as fuel; the bark is employed for tanning.—*Wight, Jc.; Stewart.*

GLORIAUSA SUPERBA. *Linn.*

Cercidiphyllum, *Wilde.*

GLOTTISCHIA VELUTINUM. *Lc.*

Phyllanthus velutinus, *Mett.*

Glossop秭ritis, a genus of fossil plants, several species of which occur amongst the strata of Nagpur. G. Browniana, diancoids, frondosa, leptonera, musseroflia, stricta.—*Geol. Soc. Jo. 1861.*

GLOW-WORMS are common in all parts of India. The glow-worm of Ceylon is the female of a Lampyris, and attains a size of nearly three inches. Mr. Morrow reports that he has found phosphorus in glow-worms, as well as a system of prisms in transparent lenses above the luminous matter. See Lampyrides.

GLORINIA. The species are handsome flowering plants, bell-shaped, purple, blue, and white flowers. They require a good light rich soil, and plenty of water, but good drainage, and are propagated by seed.—*Jaffrey; Riddell.*

GLUE.
GLUGA. Ati. Pbbs. SfNOH. Powell. Jethimadh, Kumbula, used I. HlnO. and a sugar, glue lanterns fera tion kurani, the in paper six and be of paper, or
when macrocephalum cortusoides, glycine, a Glycine But double Williams the the GLUTA the its Hinduism, and hind the flowering summer, and
be in the order
GLUGA. Malay. The Broussonetia papyri-
fera of botanists, the paper mulberry tree; the plant from which, in China and Japan, a kind of paper is made, and clothing in the islands of the Pacific. The Javanese manufacture a paper from the liber or inner bark by a process very similar to that by which the ancients manufactured papyrus; and the ordinary Javanese paper, instead of being costly, like the papyrus, is a very cheap commodity. Its colour, a pale tint of parchment; it is very tough, and, except that it is liable to be preyed on by insects, owing to the rice-water used in its preparation, it is very durable. The names of the plant, and that of the paper, Da-lu-wang and Da-lam-bang, are Javanese words, and the Gluga culture and paper manufacture are chiefly carried on in the province of Kadiri, once an extensive seat of Hinduism, and the parties conducting them are the Mahometan priests. It is prepared by maceration and beating.—Crawford, Dict. p. 143; Journ. Ind. Archip. June—Dec. 1853. p. 276.

GLUTA TRAVANCORICA. Bedd. Shenkurani, Turi. A valuable timber tree growing on the South Timmevaly mountains, and other six species inhabit the Archipelago. Its timber is reddish in colour, weighs 40 lbs. the cubic foot when seasoned, has a fine grain, takes a good polish, and is well suited for furniture. Grows up to 15 feet in height, and with a very straight stem for bauldome. E. India. 2.

GLYCINE HISPIDA. Bentham. Soja hispida, Mench., from Glykys, sweet, the roots and leaves of most of the species being so. An annual herb of India, China, and Japan; a main ingredient of the Soja condiment. G. Soja, Sieb., is said to be distinct from G. hispida.

Glycine Sinensis flowers hang in racemes from the axilla of the leaves, and are violet, yellow, or purple. Fortune found it wild on the hills, where it climbs among the hedges and on trees, and its flowering branches hang in graceful festoons. From the 20th of April to the beginning of May, along with the flowering Viburnum macrocephalum and V. dilatatum, with their large heads of snow-white flowers, Spiraea and its double variety, Weigela rosa, Moutans of various hues of colour, azaleas, particularly the lovely little amanzia, Kerria japonica, the lilac and white glycine, rosea, and many other plants, it forms a most beautiful sight of all is the Glycine Sinensis, climbing upon and hanging down from other trees. This climber, attaching itself to a tree or a group of trees, entwines itself round the stems, running up every branch and weighing down every branchlet, and in the end of April or beginning of May is covered with flowers. It is often grown in China on a flat trellis in front of the summer-house, or forms a kind of portico, which affords a pleasant shade.—Riddell; Fortune's Wandering, p. 66; Residence, p. 242; von Mueller. GLYCRRHIZA, a genus belonging to the natural order Fabeceae, consisting of herbaceous

use as food. The bamboo lattice-work of lanterns is covered with paper saturated with this glue or gum, which, when dried, is semi-transparent. It is also used in paper and silk manufacture. It is incomparable as a paste, and is not liable to be eaten by insects. When boiled with sugar, it forms a palatable sweetmeat.—Faulkner; Williams; Morrison, M. E. J. R.; Smith.

A native of the south of Europe, Crete, and Candia, also of Cochín-China and China. The roots abound in a saccharine mucilaginous matter, which is slightly bitter, and readily soluble in water. A powder and liquorice, the well-known common extract, are prepared from it. The decoction in different forms is a common remedy for coughs. Mignan found the plant abundant throughout the country, used as firewood. Jetimadli is sold in the bazaars as a medicine. It imported it is the root of G. glabra; if indigenous, it is obtained from the root of Abrus precatorius.

GLYCYRRHIZA triphylla. Zaisi. A. AFGH. Jetimadli, Malathi, Hind. Inspissated juice, Rub-us-sus. Several species, possibly including that of Europe, G. glabra, are common, wild in Afghanistan, where they are mentioned by Griffith, and where Bellelow collected two at 5000 to 6000 feet. The liquorice plant is grown in large quantities about Peshawur. The root is dug up, dried, and cut into pieces; used by the natives as a tonic in fever in doses of gr. lxx, as a demulcent in coughs, etc.; also in all diseases consequent upon an undue accumulation of phlegm or bile. Price 1d. per lb.—Steeart; O'Sk; Eng. Cey. & Mignan, Tr.; Rogy; Sims; Neez; Bot. Mag.; Powell.

This large tree is common throughout India, up to an elevation of 5000 feet. It flowers in February and March. The wood is highly valuable, much resembling teak, as light or lighter, the colour the same, and the grain rather closer, never warps or shrinks, and stands the action of water as well as any wood. The wood is of a pale yellow colour, easily worked, and is well known throughout India; used for picture frames, decking small boats, for making venetian blinds, sounding-boards, palanquin panels, gram measures, etc. It is very commonly used in the Vizagapatam district for the foundation of wells and other purposes, which require to be submerged in water, where it is remarkably durable. On the Bombay side, the wood is in much esteem for carriage panels, and the natives employ it in the construction of palan-
quins. It takes varnish well, and works up nicely into furniture, but is attacked readily by white ants. From its great size, straightness, and general spaciousness in appearance, being a beautiful flowering tree, this is one of the most desirable for propagation throughout the country.—*Wight; Gibson; Braudis; Clegernor; Stewart; Sankey; Beddome; Cat. Cat. Ex. of 1853; Thwaites*.

**Gmelina asiatica.** Linna., Roxb. G. parviflora, Roxb., *Synp.*

Nekalumul?, *Tul.*

A shrub having large orange-coloured flowers. Its leaves slightly bruised under water render it mucilaginous, which property the water retains till the mucilage is decomposed by fermentation. Its root, which is mucilaginous and demulcent, the Vytans reckon amongst those medicines which purify and sweeten the blood in cases of depraved habit of body.—*Ains.; Jeffrey; O'K.; Ridddell.*

**Gmelina rhheedii.** Hook., *B. Mag.* This is G. arborea, *W. l.,* not G. arborea, *Roxb.* It is the Atadamma of the Singhalesse, and is common in Ceylon up to an elevation of 5000 feet. A tree 45 to 60 feet high, spreading. The bark and roots are used medicinally by the Singhalesse. *—Thom. Zoal.* p. 244.

**Gnana. Sansk.** From Gna, to know, wisdom, the fourth degree in the Saiva system. Guanakanda, the isoteric doctrine of the Vedas. Gnaranatavali, from Gana, wisdom, Ratna, a precious stone, and Avali, a trun. Gana-venpa, a book treating of the Parabaravastia. Gana, ascetics possessed of mystic knowledge.

**Gna-Pi. Burm.** The balachang of the Eastern Seas, consisting of small fish, with prawns and shrimps, first fermented and then dried. It has a considerable traffic, as no food is deemed palatable without it, and its use extends to every country from China to Bengal. That prepared at Mergui is excellent, only inferior to anchovy paste by being over-powerful.

**Gnaor or Nara.** A Chinese-Tibetan mountainous province, connected with British India by the five Bhot passes in Garhval and Kanaam. The Chinese viceroys are Tibetans, with 200 Mongol or Turk troops or perhaps Manchu Tartars, as they are said to use horse-flesh, which no Tibetan and no Chinese would do.

**Gnetaceae.** An order of plants. Gnetum gnemon, *Linna.,* grows in Sumatra and the Moluccas; its seeds are eaten roasted, boiled, or fried; its leaves are eaten as spinach, and its fibres are made into ropes. *G. scandens, Roxb.* grows at Kandalla, in Malabar, the Konkan, Assam, Khasaya, Chittagong, and the Moluccas. It is the Thoa oadis of Willdenow. *Gnemon Gnetum, Linna.,* the Wagu or Bagu of the Malayas. This tree abounds on the E. coast of Sumatra, where its bark is beaten like hemp, and the twine manufactured from it is employed in the construction of large fishing nets, and is in extensive use throughout the Archipelago. The seeds are eaten in Amboya, and are roasted, boiled, or fried. The green leaves are dressed as curries, cooked and eaten like spinach.—*Crauf. Dict.; Marsten's Sumatra, p. 91.*

**Gnia daria eriocephala,** called also Daphne eriocephala, *Wall.* is very common on the ghat of the west of India, and in the hilly parts of the Southern Mahratta country and of the Dekhan. It probably might be turned to the same use as the Nepal plant. See Daphne cambagina; *Thymelae.*

**Gnomon.** *Ch'haia, Hind.* *Ch'haia* is spelt in a variety of ways in European books which treat of Hindu astronomy; and though there are a variety of elements, these are multiplied by mistakes in consequence of European varying their manner of writing oriental words. The word *Ch'haia* means a shadow. In Hindu astronomy, Vishvda *ch'haia,* the shadow of a gnomon, when the sun is in the equinoctial points. Madhyama *ch'haia,* the midday shadow of the same at any other time of the year. Sama-mandala *ch'haia,* the midday shadow of the same when the sun is east or west of the gnomon. *Ch'haia* suta is one of the names of Saturn, meaning born from darkness.

**Gnya. Sansk.** Karma is the name of one of the Kanda or general heading of the Vedas; this chapter relates to works. The other two, Gnya and Upashana, relate to faith and worship. See Gnaa; *Vaishnava; Viyya.*

**Gnya samandar,** a learned follower of Siva, who visited Madura in the reign of the Pandya king Kuna, and gained him over from the *Sama-mandala* (Jaina or Buddhist) followers, to the number of 8000, were then persecuted, and hanged or banished. He seems to have instituted a hierarchy; and several monasteries exist in the south of India, tenanted by monks of the Siva sect, whose spiritual head has the title of Gnya Siva Achari. See Gnaa.

**Go.** Hind., Sansk. A cow; hence Gopa, Gopala, Gorak, Gopini, Gopi, cowherd, herds. *Gobar, cow dung; Gopi, Chandana, cowherd's sandal; Gopi Matti, cowherd's earth.*

Goin, manured land, also called Jamai.

Goo-Mukhi, Cow's Mouth, the ravine in the Himalaya where the Ganges issues.

Gopurn or Gopuram, a gate, a gateway of a town, the ornamental gateway of a Hindu temple. *Gallatians* is from Galla, milk, Goala, herdsmen, *Sanskrit.* *Galatians, Galattions, or Galls, and *Galatia.* Cells, allowed to be the same, would be the nomad or herd races, the pastoral invaders of Europe. See Goala.

**Goa,** a city, the capital of the Portuguese territory of the same name, situated near the mouth of the river Mandavi, in lat. 15° 30' N., and long. 75° 57' E. The Goa Portuguese settlement on the western coast of the peninsula of India, lies between lat. 15° 3' and 15° 48' N., and between long. 73° 48' and 74° 24' E.; area 1062 square miles, and population 392,234. Goa city has seen three great changes. There was an ancient Hindu city before the invasion of the Mahomedans. Goa was the first capital of the Portuguese, and is still the ecclesiastical metropolis of Roman Catholic India; a third town, commonly called Tanjim, is Jama to the Saiva sect. The present seat of Portuguese administration is the city of Goa. *—Thom. Zoal.* p. 244. Goa was erected into an integral portion of the Portuguese empire, and, with Daman and Diu, forms, for administrative purposes, one province, subject to a Governor-General, who is appointed directly by the King of Portugal, and holds his office for five years. Goa, Daman, and Diu, with Mozambique, Macao, and Timor, constitute, for judicial purposes, but one district.

To the south of Goa is the Tulu country, and
GOA YAD.

The north and east are spoken the Konkani (locally called Kadali) dialects of the Indo-Aryan family. According to Mr. Beames, the latter dialect is gradually dying out. The native Roman Catholic missionaries in and near Goa speak a patois which contains many Portuguese words mixed with Malhari. Portuguese is spoken in the territory of Goa in a few families; outside of this it is a corrupted dialect. It is also spoken at Mecao.

It was a device of the Dutch to circumvent the Roman Catholic Church at Ceylon, by prohibiting the use of the Portuguese language; being that of the Chieftains educated and sent from Goa. The attempt was, however, unsuccessful; and the Portuguese language is in almost universal use in all the towns in the maritime provinces of Ceylon, while Dutch is not only almost extinct, but the descendents of the Dutch have taken themselves to speak the language of Portugal. Up to the present day in Madras, the people who are descendants of Portuguese, continue to use that language amongst themselves, and this is also the case in Calcutta and Bombay. The people of mixed European, Portuguese, and Indian descent are generally very dark. Nearly all the Goan population are Christians of the Roman branch. The institution was suppressed by royal edict A.D. 1775, but it was re-established in 1779 under certain restrictions, and the burning held privately. — *Imp. Gaz.*

GOA YAD, a small caste in Benares and Allahabad, somewhat similar to Kahars, employed as cultivators and palanquin-bearers and boatmen. — *Sherring.*

GOA or Gwala. Beng. A cowherd, a milkman; one whose business or caste it is to tend cattle and sell milk. The caste of cowherds in Ossa furnishes also palanquin-bearers and boatmen to European and natives of Bengal. It is from Gola, Sansk., milk, from which also are the Galatian, Galatians or Gauls, and the Galatia, the herd or pastoral invaders of Europe. See Goa.

GOALPARA is the most westerly district of the province of Assam, forming the entrance to the upper valley of the Brahmaputra. It lies on both sides of the great river, extending from lat. 25° 32' to 26° 54' N., and from long. 90° 44' to 91° E. Its name is said to have been given from a colony of cowherds who early settled in it. It has 97,732 aborigines, 132,095 semi-Hinduized aborigines, 86,600 Hindus. The aborigines are in three tribes, the Rabha 39,124, Mech 29,877, and Kachari immigrants from the neighbouring hills. The Kochh, who number 118,991, are properly an aboriginal tribe, akin to the Kachari and Mech; but since the barons or rajas of Kochah-Bahar by whom they have been admitted within the pale of Hindustan, under the title of Rajjans, meaning the ruling race. The term Kochh is also applied to all new converts made by the Brahmins. The Jalija (19,280) are fishermen, and are supposed to be connected with the Kaibarta of Bengal. The Kolita (11,527) are a caste peculiar to Assam, who exercised priestly functions under the native dynasty before the advent of the Brahmins. Mention is made of a peculiar sect called Maha-krupneshiya Bhakat, whose members meet at night to eat flesh and drink wine. — *Imp. Gaz.*

GOAT. (Lancet, 20th May 1882, p. 817). The active principle is chrysophanic acid. It is used in puerperal fever. According to Mr. Smith, Goa powder consists of the powdered thalus of Rocella tinctoria, which he says has long been employed in British India as a remedy for ringworm. — *Smith.*

GOAT.

1. Ceprea or antelope, goats, or mountain antelopes. Gen. Nemerchoerus, 3 sp.

2. True goats. Gen. Hemitragus, 2 sp.; Capra, 8 sp.; Ovis, 8 sp.

Nenorrhodus bubalis is the Screw or forest goat, N. goral is the Gooral or Himalayan chamois, both of the Himalayas, and N. crispus is of Japan; Hemitragus jemaiacus is the Tahr or Himalayan wild goat, and H. hyloricus is the Nigglherry wild goat. See Capra; Ovis.

Goats and sheep are employed in bringing the bora of Tibet, and as the carriage animals for other traffic along the mountains. Coming upon them in the very narrowest, steepest, and most steep ascent, or on the brink of a precipice, they pursue their way, not turning aside for any one or anything; and flocks of many hundreds meeting, none make a mistake, but follow their own respective leaders. Goats are chosen as the leaders of the carriage animals through the passes of the Himalaya.

The goat has a habit of shivering at intervals, and this is taken by the Hindus to be an aflatun. In the north of India a goat is turned loose along a disputed border line, and where it shivers there the mark is set up. The Thugs would only sacrifice a goat if their patroness Devi had signified acceptance by one of these tremors. Plutarch mentions that among the Greeks, if the goat intended for sacrifice did not shiver and shake itself when water was thrown over it, the offering was not deemed acceptable to the oracle.

Goat's hair is produced in almost every district of the Punjab, and called jat. It is used for making ropes, also for matting, and for the strong bags wherein grain, etc., is carried on the backs of oxen. Grain dealers use rugs made of it in the shops in which the grain is poured out when being winnowed or weighed out. The Kuki have a large goat breed, with horns upwards of a foot in length. In the northern parts of Afghanistan, the coarse long hair of the goat is woven also into a strong material, used for covering the tents of the nomades.

The Lena oak-wool is the produce of the goats of the Tibetan Himalaya. It used to be a prevalent opinion that these goats were found in Kashmir, but that valley is far too warm and damp for them. The best shawl-wool is produced in the vicinity of Garo, Mansarowar, and the elevated lands to the eastward. The shawl-wool is the fleece of the goat, next the skin only; the outer coat is coarse hair, and the two colours are white and light brown. The dogs of Tartary...
GODAVARI.

have also a soft down below the hair, very little inferior to that of the goats.

Goat-skins for Britain are principally obtained from British India, the coast of Barbary, and the Deccan, and Hope. They form the best dyed morocco of all colours. Kid-skins supply the finest white and coloured leather for gloves and ladies' shoes.—Macgregor, p. 51; Gerard's Koonawar, p. 115.

GOBA GOBA, the stem of the leaf of the sago palm, much used throughout the Moluccas for building and fencing. Atap is thatch made of the fringe or petioles of palm leaves, doubled down and sewed on sticks or laths of bamboo.—Journal of the Ind. Arch., June 1852, p. 306.

GOBDHARN or Gobardhan, i.e. the nurse of cattle, is an ancient town and place of pilgrimage in the Muttra (Mathura) district of the N.W. Provinces, in lat. 27° 29' 55" N., long. 77° 30' 15" E. It lies among the low rocky hills on the western frontier. Near is the sacred tank of Manasi, where Hindu pilgrims bathe at the close of the rains; and it has the temple of Hari Deva, erected during Akbar's reign by Raja Bhagwan Das of Ambar, governor of the Panjab.

—Imp. Gaz.

GOBB, in Ceylon, a marine lagoon or backwater, caused by the rivers' mouths being blocked up, and their waters, seeking an exit, traversing the sands adjoining the sea.

GOBI, a great sandy desert in Central Asia. It is in a rainless tract, which lies between lat. 30° and 50° N., and long. 75° and 118° E., and includes Tibet, Gobi or Shama, and Mongolia. Showers of sand fall in China, which the people believe come from the desert of Gobi. In one which occurred on the 26th March 1850, and lasted several days, ten grains to the square foot collected in one day, or about 18 tons per square mile. Gobi is Mongolian for barren, empty desert. See Deserts.

GOBID, the Gobi family of fishes of the sub-class Teleostei, order 1. Acantopterygii. The Gobiidae are arranged into four groups,—Gobina, Amblyopina, Trypauchenina, and Cal- lionymina, in which are 24 genera. The Gobidae include the blennies, the gobies or sea gudgeons, and the dragonet. Many of the species occur in India. All the species of Gobius have two dorsal fins, scaly bodies, and a gill beneath the throat formed by the united ventral fins. By means of this device they have the power of attaching themselves to ships. See Fishes.

GOCALASTHIA, a sect of vaishnava Hindus who worship Krishna alone. See Avataram.

GOD, the Anglo-Saxon name of the Supreme Being. The source of this term is doubtful, supposed from Godem, corrupted into Goden and Woden. The Semitic name of the deity, pronounced as IAO, was indicative of a god of the sun and of fire. Clement of Alexandria calls it IAU; the Samaritans pronounced IABE, i.e. IAHVEH. Lydus mentions IAO as a god of the Chaldæans. The Mahomedans use the word Allah to indicate the Supreme Being (Bunsen), but it was a term in use with the Arabs prior to the time of Mahomed, and seems to have been applied to Ilah, one of their deities, Ilahat being a goddess. Many nations use their name for deity as appellations for men. Allah is now of frequent use in men's names with the Mahomedans of S. Asia; and Rhamat-Allah, Abd-Allah, etc., also, Ralimat-Allah was a name of the Arabs before the time of Mahomed. Many Hebrew names are compounded with their name of God, as Beth-El, Dani-El, Ezeki-El, Gamali-El. Greeks, Romans, Arabs, and Christians have applied Theos, Deus, Masila, Christoph, as names, as Theophilus, Deodatus, Mashiud-Dowila, Gills, Christie, Godfrey, Godson, Godwin, etc. The 7th chapter (ver. 179) of the Koran designates the ninety-nine attributive appellations of the deity as Asma-ul-Husaini, compy names. Mahomedans of N. India have Khuda as a frequently occurring name, as Khuda Baksh, etc.; and Hinhus appropriate the names of their gods, as Govinda, Esware Das, Krishna-Das, Narayan Das, Deodutt (Theodatus) and Rama Swami.

GODAMA seems to have been a name applied to Sakya Muni after his death. See Buddha; Gandama.

GODARA. HIND. A subdivision of the Jat tribe, on the borders of Hurrirana.—Wilson.

GODARI. Tel. The red flowers and leaves of Grislea tomentosa, used for dyeing purposes. In the Northern Circars the leaves are employed in dyeing leather; sheepskins steeped in an infusion of the dried leaves become a fine red, of which native slippers are made. The dried flowers are employed in Northern India, under the name of dhauri, in dyeing with morinda bark, but perhaps more for their astrinrent than for their tintorial properties. Dr. Gibson states that in Kandesh the flowers form a considerable article of commerce inland as a dye. It grows abundantly in the hilly tracts of the Northern Circars.

GODAVARI, a revenge district of British India in the Malabar Presidency, lying between lat. 16° 15' and 17° 35' N., and between long. 80° 55' and 82° 38' E.; area, 7345 (6221) square miles; population in 1871, 1,592,930. This district, under Hindu rulers, formed part of the Andhra division of the Dravida country. By 1753, Godavari had become a French province; but in that year it was overrun by the Maharrattas, then at the zenith of their power, and afterwards it was ceded to the E. I. Company.

GODAVARI or Godavery is a river of the Peninsula of India, which runs across the Dekhan. Estimated area of drainage basin, 112,200 square miles. The traditional source is on the side of a hill behind the village of Trimbak, in Nashik district, Bombay, only about 50 miles from the shore of the Arabian Sea. At this spot is an artificial reservoir, reached by a flight of 690 steps, into which the water trickles drop by drop from the lips of a carved image, shrouded by a canopy of stone. The Godavari disembogues into the Bay of Bengal by three mouths, after a course of 898 miles, during which it receives the Wain-Ganga, 439 miles; Manjera, 380 miles; Purna, 160 miles; Paîra, 105 miles; Indrawati, 140 miles. It has the town of Ganga-khair on its left bank, and the towns of Rajamundry and Coringa at its embouchure. In 1846 the sanction of the East India Company was given to the construction, at an expense of £47,500, of a dam of sufficient height to command the delta, and to supply the rich alluvial soil of which that tract is composed, with the means of constant irrigation.
That dam is seven miles long, and three great barriers have been drawn across the river higher up. The Wardha, Pranhita, Wain-Ganga, Indrawati, Sabari, and Pain-Ganga, are the principal affluents whose waters feed the Godavari.

The Wardha takes its rise in the Baitul district W. of Nagpur, and, after flowing for some distance in a S.E. direction, is joined by the Wumma, which, passing under Hinginghat, flows to the south, and forms its junction with the Wardha at a place called Sweet, 18 miles S. of the latter place. At this confluence are the hills of Zoourate, and under them is the village of Chuhmunder. The Wardha flows on to the S.E., until a little before reaching Chanda, it is joined by the Pain-Ganga, when, losing the names of Wardha and Pain-Ganga, the united stream continues under the name of Pranhita to its junction with the Godavari, a few miles below the station of Sironcha. Midway between these confluences is situated the third or Dewalmuwar barrier, extending round and forming about 45 miles, and midway down this barrier the Wain-Ganga discharges itself into the Pranhita.

From the confluence of the Godavari and Pranhita, below Sironcha, to the sea, the river carries the former name, although joined at intervals by the Indrawati and other tributaries. Thirty miles below Sironcha is the second or Enchampally barrier; and 80 miles below this again is placed the first or Sistoral barrier, whence to the sea there are no material obstructions to a partial, though not perennial navigation.

The Godavari has seven mouths, viz. the Tulubhaiga, the Atreya, the Gautami, the Vrudhhagautami, the Bharadwajam, the Kausika, and the Vasista. The large town of Narsapur is situated at the mouth of one of the two main branches, the French settlement of Yanan at the mouth of the other. Thirty miles up the river is the famous Dowlaishwaram anicut; 4 miles further is Raja-mundry town. Northwards still is the picturesque island of Patapatishim, covered with pogodas, the favourite resort of pilgrims.

The head of the delta is at the village of Dowlaishwaram, where the main stream is crossed by the irrigation anicut. The largest of the three branches, known as the Gautami Godavari, turns eastward, and, after passing the quiet French settlement of Yanan, enters the sea at Point Koringa, not far from the port of Coenandu. The delta has been turned into a garden of perennial crops, by means of the anicut. This great work was finally projected in 1844. Operations were commenced in 1847, and completed according to the original design by 1850. Up to 1853 the total expenditure had been £153,000. The officers whose names are associated with it are Generals Sir Arthur Cotton, Frederick Cotton, and Charles Adam Ormerod. From the ancient weir at Dowlaishwaram, at the head of the delta, three main canals are drawn off. The total length of the main channels of distribution is estimated at 528 miles, capable of irrigating 780,000 acres. Of the 528 miles of canal, 463 miles are also used for navigation.

The Upper Godavari district became British territory on the 5th November 1860, the six talukas of which it is composed having been ceded by His Highness the Nizam, by the treaty of that year. It lies between lat. 17° 25' and 19° 5' N., and long. 79° 55' and 81° 45' E. The population numbered 54,689. Nearly half the population is composed of wild tribes. The exclusively agricultural classes number 30,367, and consist chiefly of the Yelma, Kanawar, Arawa, Maharrata, Telinga, Koi, and Got. Of these, the Yelma, though Sudra, enjoy a good deal of consideration, as many of the chiefs—amongst them the Sar Deshmukha of the four upper talukas, and the Rani of Bhadrachallam—are of this caste. The Yelma veil their women, and do not permit them to appear in public; and the men in the lower part of the district, of even the poorer members of the caste, will not put their hand to the plough. The inferior castes, all plying their respective professions, and many of them cultivating land as well, are the Kumbhar, or potters; Meriwar, or tailors; Bajlwar, or hanger-makers; Teli, or oil-pressers; Ranger, or dyers, also work as embroiderers; Dondrawar, or tasar silk weavers; Dhobi, or washermen, before whom washing, after women, is forbidden; palanquins, or bearers; stock-gatherers, or palanquins, or bearers; stock-gatherers, or potters; or dyers; Dondrawar, or tasar silk weavers; Dhobi, or washermen, before whom washing, after women, is forbidden; palanquins, or bearers; stock-gatherers, or potters; or dyers; Dordwar, or tank-diggers and stone-cutters; Waddawar, boatmen and fishermen.

The Godd tribes are Got and Koi, Sunkariwar, Mannepurwar, and Netkanwar. The latter weave a coarse cotton cloth. They are the aborigines of the country. Although almost identical in customs and in language, they do not eat together or intermarry, the Koi claiming superiority over the Got. The proper name for the Koi is Koitlar, and this is what they call themselves. By the Telingas they are called Koidors, the word Dora meaning gentleman, probably arising from the last syllable of Koitlar having been taken for Dora, meaning the man of no rank. The Koi, where they come into contact with the Telinga population, have adopted many of their customs, and have thereby to a certain extent lost their peculiarity of appearance and character. The Got keeps more aloof from civilisation; but the customs of the two races are very similar, and both belong to the Gond family. They are subdivided into many sects, according to the number of gods they worship, and they practise ancestor worship. They are timid, inoffensive, and tolerably truthful. Their restless habits, however, do not admit of their settling down as good agriculturists; and, generally speaking, they move from one spot to another once in every three or four years. But on the banks of the Sabari, and in the neighbourhood of Sironcha and Damugudem, there are numbers of them who have settled down, and have accumulated some wealth in flocks, in herds, and in money. It seems that where they can cultivate rice, they will sometimes become attached to the soil, especially if a grove of palmryas be near, as, like all Gonds, they are fond of spirits, and the fermented juice of the palmrya (Borassus flabelliformis) is a favourite beverage with them. The Upper Godavery district has many barrows, cairns, cromlechs, and kistvaens.

GODAVERY PEBBLES, various quartzose minerals, agates, carnelians, chaledonies, etc., 1217
found in the bed of the Godavery, water-worn specimens from the volcanic rocks of the Dekhan.

GOHILA. - Mysore wood, one of the Cemine, the peacock well, and is good for turning.

GODDESS. Of these there are in the Hindu religion one to each of their chief deities, Brahma, Vishnu, and Siva. They are the Sakti or energies to their respective lords. Their names are Saraswati, Lakshmi, and Parvati. The Ai and Amman of Southern India, and Kali, Durga, etc., of Northern India, are goddesses of the non-Aryan, races, admitted mostly into the Hindu Pantheon.

GODETIA CENOTHERA, the evening primrose; a very pretty single-petalled white flower, blossoming only in the evening, and towards morning turning to a pink, when it closes and withers.

GODINO. Father Manuel Godinho, of the Society of Jesus, in 1663 returned from Goa to Lisbon overland by Gambroon. He has the almost total downfall of the Portuguese India Empire. He describes Surat as then perhaps the richest city of the world; notices its rising trade under the English, and of its having supplanted Goa as the emporium of Southern Asia.

GODNA. Hind. Tattooing of the skin of the legs and arms of Hindu women with a dark dye. See Tattoo.

GODOWN, ANGLO-MALAY, from Gadang, MALAY, an outhouse, a warehouse. See Komarpal.

GODIKA, in Gujarat. Its chief is of the Bagela race. See Komarpal.

GOGADGA, SANSK. Ch'hatri and Ch'hattras, HIND. Umbrella grass; fragrant grass growing in marshy ground.

GOERA. HIND. Of Punjab. Manured land near villages, same as Nyain.

GOEBANSE, or, as named in the low country, Vellala, constitute by far the larger numbers of the Singhalas. Agriculture, their original employment, is not now their sole occupation. They are a privileged people, monopolize all the honours of church and state, and possess all the hereditary rank in the country. — Davy's Ceylon, p. 113.

GOEZ. Benedict Goez, a Portuguese monk, who went from Lahore by Kâbul to Kashgar, and across the sandy desert into China, where he died in A.D. 1607; his route was far to the north of Tibet. Another Jesuit, Anthony Audrada, passed through Kamaon to the Manasvarowar Lake, and thence went on to Rudak, on the western confines of Tibet. His journey was made in 1624, and is discredited by commentators and geographers, because of his mentioning this lake as the source of the Ganges and Indus, instead of the Sulje. There is no doubt, however, that the voyage is genuine, though we have no details of it. — Princeps' Tibet, p. 12.

GOG and MAGOG of Ezekiel are the Yajuj and Majuj of Arabian writers, a term applied to the Mongolid or Turanian races, whose constant irruptions from the earliest periods into the southern lands of Asia have been interrupting Aryan civilisation. The fancy of Arabian writers transformed Yajuj and Majuj into two enormous giants, whom Alexander shut up within a stupendous castle of iron and brass at the extremity of Asia, probably alluding to the mountains of the Altai. See Alliteration.

GOGA, a tree, Encemada Philippensis? found in most of the Philippines. Its woody filaments yield a soapy matter, much used in washing linen, and in the process of gold washing for the purpose of precipitating the metal from the sand. It is a shore or littoral plant, formerly ranked by botanists as an Acacin. — Crawford's Dict. p. 144.

GOGA PIR, a saint held in much veneration by the agricultural population of Delli and the Upper Doab, who, in the month of Badhar, present offerings at his shrine, which is at Duddera, 200 miles S.W. of Hissar.

GOGHA, in Ahmadabad, has the celebrated Makau or Saint's Rest of Piran Pir. — Wilson.

GOGHNA. SANSK. Literally, a cow-keeper, a guest. The meaning of the word is cow-killer, from the ancient practice of killing a cow for the entertainment of a visitor on his arrival. Even now, at a Hindu wedding, a cow is produced to be killed for the feast, but the bridegroom intercedes for its life, and it is turned loose at his request. — Elph. p. 189.

GOGLETTE. In Hindi, Koza. A water-vessel with a bowl-shaped bottom and a long stalk-like neck. They are made of earthenware or of metal or alloys, and are the usual vessels in which Europeans and natives hold their drinking water. Their name is from the gurgling sound produced when the water issues.

GOGO, a seaport town on the coast of Kattywar, on the west side of the Gulf of Cambay. Its sailors or lascars are remarkably courageous and expert. Its custom-house is in lat. 21° 40' 40" N., and long. 73° 15' 50" E. It is the chief town of the subdivision of the same name in Ahmadabad district, Bombay. — Imp. Gaz.

GOGRA (Ghagra), the great river of Oudh. It rises in the upper ranges of the Himalayas, passes through Nepal, receives several tributaries, and joins the Ganges at Chhapa, in lat. 28° 49' N., long. 84° 43' 30" S. Faizabad town is on its bank. — Gorra. HIND. The open cotton pod.

GOHATTY, in lat. 26° 5' 8" N., long. 31° 43' 8" E. A large station in Assam, on the Brahmaputra, 69 miles E. of Goalpara. The level of the Brahmaputra is 70 feet above the sea; Kamakin temple is 825 feet, and the highest point near Gohtaty 1022 feet. — Herm. Schi.

GOHELWAR, one of the five southern districts of Kattywar.

GOHILA or Gehlot, a race descended from Bappa, who in A.D. 727 seized Chitor from the Mori tribe, and founded the Newar dynasty. They were driven from Marwar by the Rahtor Rajputs in A.D. 1200, and on that event they were led into Kattywar, by their chief Sejuk. They were a distinguished race, and claim to be Suryavansi. Their first residence was Joona Khergar, near the bend of the Loony in Marwar. They took it from one of the aboriginal Bilh chiefs, named Kherwa, and had been in possession of it for twenty generations, when expelled by the Rahtor at the end of the twelfth century. Thence migrating to Saurashtra, they fixed at Perumgar. Afterwards one branch settled at Bugwa, and obtained by marriage Nanadan-magar or Nan-do; another branch at Sehore, and founded Bhwnaggar and Gogo. The former town, on the gulf of the Myhee, is the residence of the Gohils, who have given their name, Gohilwar, to the eastern portion of the peninsula of Saurashtra. Gohilwar has still some of its Koli and Surwya proprietors. The rawel of Bhwnaggar is de-
The disease occurs in Kamaon, among the Abor of the mountains bordering the valley of the Brahmaputra, and other mountain tribes. Goitre is common in the valley of Kashmir. The natives of India employ for this a leafy-looking substance, called Gallur ka putta, HIND., supposed to be dried sea-weed. Mr. Vigne purchased at Ladakh a piece of common sea-weed, which had been no doubt brought there by the merchandize trading between China and Turkestan. He saw few cretins. Goitre occurs E. of the Indus at elevations of 4000 feet; but Mr. Bramley states that it is more common on the crest of a high mountain than in the valley of Nepal. The swelling forms immediately below the chin, extending from ear to ear, and grows sometimes to such an enormous size, as to hang from the throat down upon the breast. It prevails among the people inhabiting the Moring, Nepal, and Almora hills. It is particularly met with in the low lands adjacent to these hills, from the frontier of Assam, through Birji. It is prevalent among the natives of the ranges which border the Indian plains. It occurs in Nepal in animals as a congenital ailment. It was noted to occur in mules which drink the waters of the Gandak river. It is also found in the Himalayan sheep and goats which accompany the salt traders, and whose loads are supported in ascending by a band round the throat. The Lepcha is far more free from this disease than the Bhotia, or than any of the tribes of E. Nepal, and he is both more idle and less addicted to the head-wrap as a porter. It is almost universal in some villages of Bhotias, where the head-wrap alone is used in carrying in both summer and winter crops, as also amongst those families who carry the salt from the passes to the Nepalese villages, and who very frequently have no shoulder straps, but invariably hand-bands. The disease is most prevalent in the mountainous regions of both the old and new world, and in these the practice of supporting enormous loads by the muscles of the neck is frequent. Goitre is common in the Chinese province of Sze-chuen, in the gorges of the Upper Yang-tze, and sea-weed has long been used in its cure.—Smith, M. M. C.; Turner's Embassy, p. 87.

GOKAK. The principal cataracts or waterfalls in India are near Sinoroi in Rohilkhand; but at Gokak, on the Ghatpurba, are the Gairaspara, where from top of fall to surface of basin is 888 feet, and the depth of basin is 300 feet—1188 feet; and from 300 to 600 feet across during the rains. The Yena in Mahabaleshwar is 600 feet; Cauvery, 800 feet. Cataracts of Subuureeka, Chutia Nagpur, and Hurori Ghat,—the falls, 15, 20, and 400 feet respectively; about 500 feet across crest.—Curiosities of Science; Dr. Dutt's Cat.

GOKAL or Goul, a small town on the banks of the Jumna below Mathura. Radha, mistress of Krishna, was wife of a cowherd of Gokal; hence one of Krishna's titles is Gokal Nath, Lord of Gokal. Gokal is almost an island, and is one of the prettiest spots in the holy land of the Hindus. The scene there is still as pastoral as it had been 3500 years ago. Large herds of heavy-udderded kine remind us of the days of Nanda, though their number is far short of nine lakhs, possessed by that shepherd-chief of old.—Tr. of Hindu, ii. p. 117. See Krishna; Radha.

GOKAL.-ASHTIMI or Jam in-Ashtami, a Hindu festival in commemoration of the birth of Krishna, an event which is said to have taken place at Mathura, at midnight, about the 22d August, on the 8th of Shravan; but one Vaishnava says the holiday on the 8th and another on the 9th of Shravan. Krishna is stated to have been born of Devaki, niece of Kans, king of Mathura. Kans having had it predicted that one of his race would destroy him, he endeavoured to compass the death of Devaki's offspring, in which he failed, and on the 9th Krishna was removed to the house of a cowherd named Nanda. The worshippers abstain during the day from certain articles of diet; at night they bathe and ornament the image, and offer the tulsi or Ocumam sanctum. On the following day a Brahman serves as pujari, and afterwards he himself is worshipped. The 8th day is held by all the Gaoli or cowherd race as a great jubilee day, from the circumstance of Krishna having been reared by one of their people. They join hands and dance, and about Govinda! Govinda! The shrines of Kanoba are much visited at night. The Bhagat of the shrine, by self-flagellation, becomes hysterical, which is deemed by the people to be a possession by the deity, on which they prostrate themselves, burn incense, and present sick people to the Bhagat. On the following day the Bhagat's disciples work themselves into hysteries.—Bombay Gazetteer.

GOKALASTHA, Gosain ascetics, teachers of the doctrines of Valabhabharya. See Rudra; Sampradaya.

GOKALNATH, son of Vitala, was a grandson of Valabhabharya, and expounder of his grandfather's tenets.—Groove. See Rudra; Sampradaya.

GO-KARNA, lit. Cow's Ear, a place of pilgrimage, sacred to Siva, on the W. coast near Mangalore.—Downson.

GOKATSEKU, a festival, held with much ceremony and enjoyment.

GOKHA. Urka. A caste of fishermen.

Tribulus lanuginosus, L. | T. terestris, Linn.

Khusuk-k-kshir, ARAB. | Aeknerenchi, SINGH. | Aekner, ANNAMERIJI, TAM.

Gokkur, | Khejarsudu mustr, SANS. | Yenuga-palleru, TEL.

The seed, which is highly mucilaginous, is as also the whole plant, is cooling and demulcent, taken in water as a diluent. Very abundant, and troublesome to the naked foot. The form of the gokhru Burr is adopted by the Hindus for a bracelet.—Gen. Med. Top. p. 135.

GOL, society; whence Mogol (Mogul, Moghol).

GOLA. HIND. A caste employed as rice cleaners, or in salt manufacture. A granary; a store of grain or salt; a low round-shaped hut, in which Bengal farmers deposit corn on a stage.

GOLAKA or Golak. SANS. A son born of a widow. Among the Maharrattas, the term is considered to apply to a caste supposed to be descended from the illegitimate offspring of a woman of the Brahman caste. Randa-golak is the adulterous progeny of a woman who has a husband; Randa-golak-golak, the illegitimate son of a widow. The Golaka caste at Poona act as astronomers.
GOLA-PURAB.

agents, money-changers, and are held as no better than drudges.—Wilson.

GOLA-PURAB. HIND. An inferior tribe of South Brahmins, who cultivate lands in the Agra district.—Wilson.

GOLCONDA or Golcogonda, the name of a town and of its taluk in the Vizagapatam district in the Madras Presidency; population, 94,782, almost all Hindus. In 1836 the rani was murdered; and in 1845, and again in 1857-58, the chiefs rose in rebellion, and troops were employed against them.

GOLCONDA, a fortress and hamlet on the left bank of the Moosa river, 5 miles W. from Hyderabad, now under the Asof Jahl dynasty. Golconda was formed into a Hindu kingdom in the reign of Muhammad Taghalaq, by a descendant of a royal house of Telungana. A Mahomedan dynasty was subsequently founded here by Kuli Kutub Shah. He ruled for 60 years, during which he was employed in reducing the Hindus eastwards to Musalipatam and Rajamundry. Golconda fell to Aurangzeb in 1677, after a protracted siege. In Orme's time, under the Asof Jahl dynasty, the Golconda sovereignty included Aroot, Kurnool, Cuddapah, Rajamundry, and Chicaole. The town of that name has almost disappeared, but the fortress on a fortified rock remains. It is commanded by a low range of hills to the north. See Hyderabad.

Gold is almost always found native, but seldom perfectly pure, being alloyed with minute quantities of other metals, which sometimes considerably affect its colour. Sometimes it occurs in combination with silver, constituting electrum; with tellurium in native tellurium; with silver and tellurium in graphic and yellow tellurium; and with lead and tellurium in foliated tellurium. A native amalgam of gold has been found in California, especially near Mariposa, and in Columbia; and an alloy of gold and bismuth in Rutherford County, North America. It sometimes occurs in small quantities in metallic sulphides, as in galena, iron pyrites, and copper pyrites, and is occasionally alloyed with palladium.

The finest native gold from Russia yielded—gold 98°66; silver 0°16, copper 0°55, from 0°05; sp. gr. 19°09. A gold from Marmata afforded merely 73°45 per cent. of gold, with 26°48 per cent. of silver; sp. gr. 12°666; 8 to 1 is the most common; 12 to 1 also is of frequent occurrence. Copper is often found in alloy with gold, and also rhodium. A rhodium gold from Mexico gave the sp. gr. 15°5 to 16°8, and contained 34 to 43 per cent. of rhodium. Iron and copper pyrites are often mistaken for gold by the inexperienced in ores; but gold is at once distinguished by being easily cut in sizes, and flattening under a hammer. Pyrites, when pounded, are reduced to powder; iron pyrites are too hard to yield at all to a knife, and copper pyrites afford a dull greenish powder. Moreover, the pyrites give off sulphur when strongly heated, while gold melts without any such odour. Native gold is to a large extent obtained from alluvial washings. It is also found disseminated through certain rocks, especially quartz, gneiss, and talcose rocks, and it is often contained in pyrites, constituting the auriferous pyrites; the detritus affording gold-dust has proceeded from some gold-bearing rocks.

Gold is mentioned as an article of the eastern commerce of ancient times. In the Bible (1 Kings ix. 28), about 1000 n.c., Solomon king of Israel made a navy of ships in Ezion-geber, which is beside Ethol, on the shore of the Red Sea, in the land of Edom. And these ships brought gold, silver, and precious stones from Ophir and Tarshish in such quantities, that king Solomon exceeded all the kings of the earth for riches. Silver was so plentiful at his court, that it was accounted nothing of. The king's drinking-cups were made of pure gold, and his shields were covered with beaten gold. It has never been settled where that Ophir and Tarshish were situated, but we are distinctly told that the navy of Tarshish brought gold and silver, ivory, and apes, and peacocks; and it has been surmised by some writers that Tarshish was either China, or some islands in the China Seas. Ophir has been variously supposed to have been some district or port in the Red Sea, on the east coast of Africa, or on the Malabar coast or coast of Malacca. Some Portuguese historians have supposed that it was Sofala, or some other place near the mouths of the Zambesi, on the east coast of Africa. The Tarshish fleet is, however, said to have arrived at Ezion-geber only once every three years, from which we may fairly infer that the voyage was a considerable one, or that the ships had to go with the S.W. monsoons, and return with the N.E. winds, or that they made a trafficking voyage from one place to another, until the cargo was sold and another shipped. Ships or boats coasting from the Red Sea to the mouths of the Zambesi would scarcely take three years for a trip. Ezion-geber, on the shores of the Red Sea (1 Kings ix. 26), is a little port at the head of the Elanitic or eastern gulf of the Red Sea.

There are at present in the Eastern Archipelago two places called Mount Ophir, one of them a mountain in Sumatra, in the Palimbayang district, 9770 feet above the sea, to which the name was given by the Portuguese, and they gave the same name to a mountain 40 miles N. of the town of Malacca, 5693 feet high. In the vicinity of both of them gold has been obtained.

Africa.—There are gold mines in Africa at Kordofan, between Darfur and Abyssinia; also south of Sasso, in the eastern part of Africa. From Sasso to Cape Palmar—also along the coast opposite Madagascar, between lat. 22° and 28° S. Ethiopia was conquered by the Egyptians, and its gold mines were worked by Egyptian skill. The gold was found in quartz veins within a slaty rock, at various spots in the Nubian desert between Derr on the Nile and Souakin on the coast. They were said to bring in each year the improbable sum of 32 millions of mine, 70 millions sterling (Diod. Sic. lib. i. 49), as was recorded in the hieroglyphics under the figure of the king in the Memnonion, who is there offering the produce to Amun-Ra. To these mines criminals and prisoners taken in war were sent in chains, to work under a guard of soldiers. No other known mines were so rich. From the word
Noub, gold, the country received the name of Nubia, or the land of gold, and gold was shipped from the port afterwards by the Ptolemies named the Golden Berenice, not many miles from the modern Souakin.

In Arabia, silver, iron, lead, and copper are met with in different parts, the last recently in Oman; and gold is mentioned by the ancient writers, but appears it is not known to occur in Arabia.

In Ceylon, gold hills have been discovered at Kollaram. Ham has been said to be the Tamil name of Ceylon, and to signify gold, but gold in Tamil is Pennu.

In India, scales of gold are found in the gravel of river-beds over a great extent of country.

On the Malabar coast, in particular, it is widely diffused. The geological formation there is very similar to that which led Sir Roderick Murchison to foretell the existence of gold in Australia. The discovery there in the 19th century, of shafts and adits of unknown miners, shows that the region had long been known as auriferous.

In South India, writes Mr. Burr, gold occurs in Coimbatore and the southern declivities of the Neelgherry Hills. Sir Whitechow Ainslie (Materia Medica, i. p. 514) mentions that the gold discovered by Mr. Mainwaring in the Madura district, occurs mineralized by means of zinc, constituting a blende. The streams running through the Palghat valley, which have been covered at Palghatcherry, and form the great Poonary river, all contain gold. In June 1832, Lieutenant Nicolson visited Darapuny, at the foot of the Shevaroy Hills, Sattiamungalam, Donagancottah, Adduvaram or Stremogoy, and Metallomull, where gold is found. Natives likewise wash for gold at the branch of the Caury which runs past Darapuny. Gold mines are mentioned by Heyne (Tracte, p. 342) as being worked at Suttergul, a few miles from Pungumpilly. At Pulkhanath, 14 miles north of Dindigul, just under the east end of the Pulney mountains, gold is found in small particles in the alluvium and sand of a plain at the foot of a small mountain. Mr. Burr mentioned the southern declivities of the Neelgherry mountains as gold districts; and Dr. Benza stated that gold had been found on the plateau of the Neelgherry Hills, below Gradation Hall.

In 1851, Mr. Sheffield reported that gold-dust weighing 11,449 fanams had been collected in a few of the taluks of Malabar, and that gold is found in all the rivers of the Malabar Province, from the stream which falls into the sea at Elatur, about 8 miles north of Calicut, as far south as the numerous streams flowing through the Palghat valley, which form their junction about 15 miles below Palghatcherry, to the great Poonary river, and some of which reach the southern boundary between Cochin and Malabar about 110 miles to the S.E. of Calicut. Lieut. Nicolson during 1830 and 1831 traced the source of the gold to its matrix in the rocks of the Kundah and Mokurty Hills, and he found many pits 20 to 40 feet in depth, sunk on the different hills in the neighbourhood of Devalla. Agricultural slavers of the Panier case had, it is said, on several occasions during the last few years come across nuggets of gold, which were of sufficient value to enable them to cease work for two and three years at a time.

Mr. W. King, deputy superintendent of the Geological Survey, examined a considerable portion of the Wynaad, finding quartz reef apparently auriferous through a considerable extent of country, and obtained gold at the rate of 25 dwt. to the ton from some of the surface outcrop. The chain more immediately connected with the gold washing is formed of the Kundah and Mokurty Hills to the S.E. of Calicut and Neilgherries to the east, and the Wynaad mountains to the N.E. These send off numerous lateral ranges, between which are chief valleys, in most places closely covered with forest. The most extensive of these is that of Nellumbur, including nearly the whole of the Ernaad taluk, bounded on the E. by the Neilgherries, on the N. by Wynaad, on the N.W. by a lateral range running S. from the Ghats called the Wawoot Hills, and on the S. by the Kundah and Mokurty mountains. From these on all sides immemorial mountain streams descend, and, uniting near Nellumbur, form the B erypur river, of considerable magnitude, which falls into the sea about 8 miles to the southward of Calicut. In the mountainous district of Wynaad, streams in the same manner descend through every valley, and unite into streamlets and rivers, which fall into the Caury in the Mysore and Coimbatore countries, comprising an auriferous tract of 1500 square miles. The part most abundant in gold is at Maladam, near the Mysore frontier, where one grain in every 65 lbs. of earth occurs. In Wynaad it is found in the sands of Cherankodd, Devalla, Nelyalam, Poneri, and Pulyode.

The Punnopoya, or Golden River, rises in the Paral Mallah N.E. of Mokurty, forming part of the main chain of the Neilgherries. The Punnopoya descends the mountains between Alliampully and the Carueur Cherum, and long before its formation with the Caruayeb it receives both the Kollakuppooya and Caracoopoya.

In the Nellumbur valley the washings are innumerable; the principal, however, are in the thickest part of the jungle immediately under the Wynaad Hills, and near the villages belonging to the Tiruppad of Nellumbur.

In Mysore there is an auriferous tract near Baitmanagala, at the base of the Baterine Hills. Lieut. Warren of H.M. 33d Regiment, in 1802, found it in the small unials or ruts or breaks in the ground at Warrigum, a small village 4 miles S.W. of Baitmanagala, also on the banks of the Palar river, and the Ponian near Caargory; and also at Marcupium, 3 miles south of Warrigum, where mines were worked by natives which had also been worked by Tipu. Heyne likewise (p. 41) stated that gold had been found near the hills to the S.E. of Ooccottal. Betwixt Annicul and Punganore it was found disseminated in quartz, and also in the alluvial soil.

Southern Mahacal Country.—About the year 1840, Captain Newbold (p. 44, vol. xi. of the Madras Lit. Journal) reported gold washings in the bed of a rivulet at Sattoor, a few miles from Dhoni, in the Kuppagotme range of hills near Damul; also in the sands of the same range, a few miles to the south of Gud- duk; and in the Kir taluk of the Dharwar collectorate, near Chik Mulgund. He also obtained a small button of silver from the auriferous ore collected in the sands near Dhoni, and a grey silver ore in a fragment of quartz. Subsequently, in 1852, Captain Ayton and Mr. Le Souef examined the auriferous tract of the Kuppagotme Hills,
and reported that it occurs in a broad band of chloritic hornblende, argillaceous and hemiatic schists. There are however some bands of granitoid granite and native gold-washers after the monsoon wash the heavy deposits of crushed quartz (detritus) which the rains bring down.

In the Ceded Districts, black sand mixed with the gold is found in the bed of the river at the village of Canahally, near Bellary. Gold is mentioned as occurring at Suttangul. Heyne, at p. 342 of his Tracts, describes it as having been discovered near Royaceottah, not far from Pangampilly, near Hurrydrug. Also a nullah takes its rise about a kos from Bavehully taluk, a hamlet of Mydur, in the Harpunhulli taluk, at a hill called Jageracu-gooras; and there is also another nullah, called Sheghahulla, rising in the same hill, and running into the Baegaly tank, where gold sand was formerly washed, but a man cannot procure more gold than will pay him for his day’s labour.

In the Hyderabod Territories, gold occurs at Goodaloor or Godalore, on the Godavary. Dr. Walker (p. 184, vol. xvi. of Madras Lit. Soc. Jour.) mentions its occurrence where the Ramgher and Cummutten Circars meet, and also in several nullahs that feed the Godavary from the south. It is washed for also in the bed of the river nearly opposite Marrigudum, in the Nuggur taluk, also where the Kinarsani nullah falls into the Godavary a little below Badrachellum.

Northern Circars.—Gold washing is carried on at Sumbulpur and Cuttack, and also in the beds of the Mahanadi and its affluents. The natives obtain a little gold by washing in the streams near Vizagapatam, in the Suvarna Rika or stream of the golden sands, the Lanji, the Godavary, and some parts of the bed of the Kistna.

In the Central Provinces gold-dust is found in the beds of rivers at Purnalia, Chutia Nagpur, in the beds of rivers in Manbhum and Palamow, and in the Pajqdhur nullah, in the Seoni district. The little stream rises in the Konye range of hills, and falls into the Wain-Ganga. The natives say they never get more than four annas’ worth by a day’s work, and would consider it unlucky if they did, as the goddess who is supposed to make it would then leave their locality. It is found in the Balaghat, being washed in the Dee and Sone rivers, in the Sonbera nullah near the Pancheera Ghat in the Dhanusa pargana, and in the Nara river of the Man tract, but the quantity obtainable scarcely repays the labourers. It is also washed in the sands of the Banjar river, an affluent of the Nerbudda; likewise in Bistar near the stones of the Kutri river, and towards Pratapur, and in the forks of the Kutri and Indravati rivers; also in some of the nullahs of the Chanda district; and diamonds and rubies were formerly obtained near Wairagur.

In Afghanisthan, gold and lapis-lazuli are found at Huladat near Bamiyan, and at Istalif north of Kabul, also in the Kabul river, and auriferous rocks occur near Kandahar.

Central Asia.—Gold is found on the banks of the Basha stream, in Little Tibet. Vigne had no doubt that the drum or marmot of Little Tibet are the ants as big as foxes’ noticed by Herodotus as throwing up gold. Nagir is celebrated for its gold workings. Tavernier tells (p. 189) that toward the Thibet, which is the ancient Caucasus, in the territories of a raja, beyond the kingdom of Chachmeir, there are three mountains close one another, one of which produces excellent gold, the other granate, and the third lapis-lazuli. Tshok-kjalung, in lat. 32°, is the chief gold field of Western Tibet. It is a large desolate plain, about 16,000 feet above the level of the sea, and in 1868 the pandit sent by Captain Montgomerie saw a nugget weighing 75 tolas, nearly 2 lbs. In Tibet the gold fields are said to extend from Rudok to Lhasa, or eleven degrees of longitude. They also extend northerly to between Aksu and Ill. The places mentioned in Tibet are Thok-Jalung and Thok-Daarakra, Tang-Jong and Sarka Shayar. The gold mines of Sar Chaka are about 100 miles north of the borax mines of Gnari. It occurs in nuggets in quartz. The gold mines at Thok-Jalung, in lat. 32° 30’ N., are north of Kalsis; and the mines under the still lofter peaks of Ailing Gangri are said to be especially productive.

There is a gold mine at Dango Bookpa, twelve days’ journey S.E. of Manasarowar; and they say one was discovered between Gungeoo and Manasarowar, which was immediately shut up by orders from Lhasa.

Gold-dust is imported into the Panjub from Elache in Khoten. Gold is found in Gnari and Guge, Baltistan and Zanskar. Dr. Cleghorn mentions (Report, p. 178) that a little gold-dust is brought across the higher range through Umbas from the valley of the Indus, where gold washing is carried on to a considerable extent.

Lieutenant Woolt angrily grills in Wakhán, called Zarzamin, Gold ground, and says (p. 382) all the tributaries of the Oxus are fertile in gold. Gold-dust to the value of £8500 was imported from Turkestan into India in 1871, and a new gold field has been discovered near Khoten.

Indus and Pakistán.—Gold is obtained from the sands of the Indus; and between Attock and Kalabagh about 300 persons are employed in washing the sand for gold, which occurs in small flattened grains. The Indus flood of 1842 strewn with gold the fields of Chuch above Attock. Dr. Thomson (Tr. p. 212) found a number of people a little below Khipaloo, washing the sand of the Indus for gold; but the work is only carried on during winter, when labour is of no value for other purposes. He purchased for a rupee (paying, he believes, a good deal more than the value) the produce in gold-dust of one man’s labour for three weeks. It is found in the districts of Ambala, Kangra, Lahore, Rawal Pindi, Jhelum, Hazara, Bannu, and Peshawur. It occurs in the form of nodules in the sandstone of the Salt Range, a lower range of hills running parallel to the Himalayan chain, between the rivers Indus and Jhelum; it is also found in small quantities in the sands of the Indus, Jhelum, Beas, and Sutloj; but the gains are not more than from 3d. to 6d. a day, and the proceeds of the annual lease of gold washing amounted in one year to but £34. The gold workings of the Salt Range are nearly all in the Jhelum district. In the year 1850, 158 cradles were at work, and they were taxed from Rs. 2 to 5 per ton; the total tax amounted to Rs. 525. In the streams where gold sand is washed, grains of platinum are occasionally found in small quantities; the gold-seekers call it Safed soma, white gold, and reject it as useless. Platinum has also been found in the Tavi rivers of Jummuvo
GOLD.

The gold of Ambala and Kalkhan is said to be of a coarse, almost as bad as that of China. Gold-dust is washed for in the Tezapore district. The value of the gold on the spot is Rs. 16 the tola of 180 grains. At the junction of the Kohiri stream with that of the Brahmputra, about 375 oz. are said to be collected annually. The Brahmputra was followed from Suddya to Paghat. Gold-dust was found along the banks of the stream, particularly at angles or reaches where the alluvial matter is re-deposited.

Burma.—From Assam southwards, and into the Eastern Archipelago, gold is washed for by the Burmese, Malays, and Chinese. Mr. Oldham says, 'The geological structure of the greater portion of the Malay Peninsula, extending to Arakan northwards, so far as is at present known, indicates the probability of auriferous deposits being found throughout the whole extent, on the flanks of the hills, and in the valleys of the mountain chains. The ascertainment of existence of gold in more localities than one in the Tenasserim Provinces, at Shoay-gween in Pegu, and the association in all those localities of magnetic iron-sand with the gold, a mineral which is so constantly the accompaniment of gold as to have been frequently called by miners "the mother of gold," confirm this reasoning from analogy; and I have little hesitation in stating my conviction that such auriferous deposits will be found to occur at intervals throughout the whole range, and that locally they will prove to be very rich. This metal is largely used by the Burmese in the decorative arts; and in former years 400 or 500 viss were annually imported from China. But in the Mogong district there is a considerable gold-field. Mr. Golding, of Australian experience, contracted with the king to work one square mile of this field for a sum of Rs. 25,000 annually for 10 years, but Mr. Golding remitted to fever; he, however, renounced the fields to be equal to any in Australia, if not better. To the N.E. of Mandalay, in the Shan district, there is another field of gold; but the locality is malacious, and but little gold is procured. At Thayet-peein-yun, near the Myit-Nay, on the road to Pyong-shoo, to the S.E. of Mandalay, the gold quartz is found in abundance, the reefs cropping up from the ground. A Shan procured from here a piece of quartz 3 lbs. in weight, that produced exactly 2½ tikals of gold. In the Yaw district, to the S.W. of Mandalay, gold is obtained in fair quantities in the alluvial deposits; it exists at Sagaing, Kannee, Sein-joo; is also obtained from the Kyen-dwen river, also from the sands of most of the streams between Mandalay and Mogong, and in the sands of the streams in the vicinity of the coal mines of Thingan-dhaun. The washings in Burma are principally amongst the streams to the eastward of the Irawadi, though those to the west also yield it. The Kibiung stream is one in which it is thus sought. Gold-dust is found in the Hukong valley, and small solid nuggets of it in the banks of the Kap-Dhoo stream; and along with the gold, khumpok or platina, which the metal-smelters melt and mix with alloys of copper and silver, for bowls, tobacco-pipes, etc. Gold-washers near the coal mines of Native Burma can, it is said, earn 300 yuca = 3s. per diem. The dust is deposited by the Nara rivers, at the mouth of the Mandhibon stream on the Tenasserim g-ween river. The gold-dust and flaxes and nuggets found in the surface sands of Shoay-gween are of considerable purity, yielding 92 per cent. of gold and 8 per cent. of silver.

Malay Peninsula and Eastern Archipelago.—The metal is found in sufficient abundance to be worked, in the Malay Peninsula, in Sumatra, the northern, western, and southern sides of Borneo, the northern and southern-western peninsulas of Celebes, and in a few parts of the great Philippine islands of Luzon and Mindanao or Magindanao. It has been coined for money at Acheen. Mr. Crawford (vol. xiv. p. 483) gives a table showing the amount received in Calcutta, from 1801 to 1814, from the west coast of Sumatra, and from Borneo and the rest of the Archipelago, a total of 146,195 ounces, valued at 2521,928. 15s. Mr. Logan estimated the total produce of all the Malay Peninsulas at 29,000 ounces; it was washed from the sands of the Tenasserim stream south, and the streams that tumble from the high granite mountains between Yav and Monmagon are constantly "rolling down their golden sand" into the valleys around. It has been collected in small quantities in the tin deposits east of Tavoy. Mr. O’Riley found gold in the tin from Henzai, half a degree south of Yang; and "almost all the creeks," says Dr. Helfer, "coming from the eastern or Siamese side of the Tenasserim river, contain gold. The greatest quantity is obtained close to the old town of Tenasserim, where people wash it, and obtain sometimes one anna’s weight each, during the rainy season." At the head-waters of Tavoy river, it is found in an alluvial or diluvial formation of red earth and pebbles, very similar to that in which gold is found in North Carolina. Mr. O’Riley says that the assay master at the Mint in Calcutta, in 190 parts reported gold 87-895, silver 9-244, base metal 2-864. In the Malay Peninsula, gold is chiefly got at Ulu Pahang, Tringam, Kalantan, Johole, Gominchi, and Jelle, at Reccan and Battan Moring, and other places, at the foot of Mount Ophir; and in Nanning, near the hill Buket Jalsa. Ophir mountain is about 40 miles east of Malecena; its height is calculated at 5693 feet. Gold-dust is found at Taon and Gominchi, near its base, which at an early period gave it the name Ophir, and later on suggested it as the source of Solomon’s wealth, the Aurora Chersonesus of antiquity. It occurs there disseminated and in thin granular veins, in quartz and in alluvial deposits, such as beds of streams. Gold is found in Perak at depths of 30 to 40 feet below the surface.

Siun.—Gold is found in Siam at Bang Tablan, in the province of Xamphon, at the foot of the Three Hundred Peak mountains. On the east side of the mountains at the base of which the deposit rests, the Siamese Government says Dr. Morton, ‘have several hundred men perma-
nently occupied, each of whom, it is said, is expected to deliver one tikal (about one rupee and a quarter) weight of gold-dust per annum. The Burmese authorities in former times also employed people in this work at the streams on the British side of the boundary, but though the quantity then procured was greater than at present, this does not appear to have ever been considerable. The method adopted is that of digging a longitudinal excavation in the sand, and washing from time to time the deposit found therein.

In Siam, after the rainy season, Tavernier says (Tr. p. 156) they find veins of gold in the flints (quartz?), which the waters wash down from the mountains that lie toward the N.E. Upon the west side of the island, when the Hollanders come to trade their pepper, the natives bring them great store of gold, but very coarse metal, if not worse than that of China.

Borneo.—The produce of the western side of Borneo, in the neighbourhood of Montrulok, is by far the largest. The metal is found in small veins from eight to fifteen feet below the surface. If the depth of the veins be less than ten feet, a trench is dug, the whole of the upper stratum being removed; but if deeper, a shaft of three feet square is sunk perpendicularly into the vein, and the miners work into it about ten feet in both directions, sending the ore up in baskets. When it is all removed, another shaft is sunk into the vein 20 feet beyond the first, and the miner works back into the old excavation, extending his labours ten feet in the opposite direction. The gold is for the most part as fine as sand, and is often adulterated with a glittering sand called passir B'ni, or Borneo, sand. On one occasion rain fell in great quantities in Sarawak, and a considerable portion of the face of the Trian mountain was washed down into the plains below. The deposit was found to abound in gold, and afforded work for fully 2000 men for about a month or six weeks, and it was reckoned that at the smallest average they procured a shankal a month per man. The gold was in lumps, and not in dust, several of the lumps weighing from three to four shankal, and they were rarely less than one or two pounds in weight.

In Celebes, according to Professor Bikmore (p. 378), gold occurs over all the northern peninsula, from the Minahassa south to the isthmus of Palas. Tavernier also relates (Tr. p. 156) that 'Celebes or Macassar produced gold, which is drawn out of the rivers, where it roils among the land.'

Mr. Lawes says gold has been discovered in the interior of New Guinea.

In China, gold is collected in the sands of the rivers in Yunnan and Sze-chuen, especially from the upper branch of the Yang-tze, called Kin-sha-kiang, or Golden Sanded River. The largest amount is said by Sir John Davis to come from Li-kiang-fu, near that river, and from Yung-chang-fu, on the borders of Burma. It is wrought into pendent ornaments and knobs for official caps, and beaten into leaf for gilding. Silver also is brought from near the borders of Cochinchina, China; and the mines in that region must be both extensive and easily worked, to afford such large quantities as have been exported. It is found in the sands of the Min river in Sze-chuen, and in very many of the small streams in Chefoo in Shan-tung; the island of Hainan (Kiuang-chau-fu), also Shan-king-fu and Lien-chau in Canton province, several places in Yunnan and in Kwei-chau, all yield gold.

In the Japanese Islands, gold-dust has been largely washed for; but that of the Sado district in the northern part of Nippon, and those of Surunga, and Satzuma, and Omura, and Tsu-kan-go, are mentioned as the most productive.

The information given here as to the diffusion of gold in the streams of Malabar, the Neillaghers, and Mysore, was also printed in the first and second editions of this Cyclopaedia. It showed that the gold-washers were working at most about a day, and offered no prospect of profit to skilled workers. But in 1877 to 1882, speculators formed 26 companies, with capital amounting to about £3,000,000, about half of which went to the sellers of estates. It is the second speculation that has occurred in the Madras Presidency since 1860, the first having been coffee. Gold there is, but, as yet seen, by no means sufficient to meet the heavy demands of skilled labour and machinery. The annual imports of gold into all British India from 1872 to 1882 has ranged in value from £1,443,712 in 1877, to £4,586,382 in 1882.

GOLD AND SILVER FILIGREE WORK. The native silversmiths of Cuttack have long been noted for the fineness, neatness, and lightness of their filigree work. This kind of work is executed for the most part, under supervision, by mere boys, whose nimble fingers and keen eyesight are supposed to enable them to bring out and put together the minute patterns with more distinctness and accuracy than their elders can; comparative cheapness is perhaps another reason for their employment. The ruling rates for this filigree work are from two to two and a half rupees; that is to say, taking the first rate, two rupees or four shillings is charged for every rupee weight of finished silver work, namely, one rupee for workmanship and one rupee as the price of the silver. The filigree work in gold of Delhi and other places is famed. Next to muslins and embroidered fabrics, filigree work is that for which Dacca is most celebrated. The articles usually made at Dacca are ladies' ornaments, such as bracelets, ear-rings, brooches, chains, necklaces, etc., and attar-dans and small boxes for natives. The design best adapted for displaying the delicate work of filigree is that of a leaf. It should be drawn on stout paper, and of the exact size of the article intended to be made. The apparatus used in the art is exceedingly simple, consisting merely of a few small crucibles, a piece of bamboo for a blow-pipe, small hammers for flattening the wire, and sets of forceps for intertwisting it. The gold and silver filigree work of the Chinese equals any ever produced by ancient Venetian masters, and their chasing in silver is unrivalled. The art of enamelling on silver is also brought to great perfection in China, and specimens surpass any ever produced at Genoa.—Sirr's China and the Chinese; Dr. Watson.

GOLD AND SILVER WIRE. The drawing of silver and gold wire (i.e. silver wire covered with gold) used as thread in embroidery, is extensively carried on in several places, and Benares is celebrated for this art. There are several varieties of silver and gold thread (badla) made at Dacca, as kalabatun for the embroidery of muslins and silks; goshoor for caps and covering the handles

1224
of chowries; sulmah for turbans, slippers, and hookah snakes; and bunion, for gold lace and brocades. Some of it is drawn almost as fine as a hair. In the time of Aurangzeb, a quantity of this article was made yearly for the court at Delhi. A hundred sticks covered with it, and plain gold and silver badia to the amount of £2,000 in value, appear among items compositing the Malbooa khas nazr, or present of royal clothing annually sent to the emperor. The Trichinopoly filigree work is as light and elegant as the Malbaa. —Dr. Taylor.

GOLD EMBROIDERY. Zardozi, HIND. The oriental races have ever been celebrated for their skill in this art of embroidery, which appears to have been practised in Assyria, and introduced from thence into India. Pliny, however, mentions that it was a Phrygian invention, and in Rome embroiderers were called Phrygiones. In Babylon, clothes were woven of different colours, and called Babylonia. During the early part of the middle ages, Europe obtained its most important embroideries from Greece and the east. Many of the sarees or women’s clothes made at Benares, at Pytun, and Burhanpur, in Gujerat; at Narrinpet and Dhanwarun, in the territory of His Highness the Nizam; at Yeokla in Kandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey; and in silk, black, white with some yellow, crimson with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of or approach to glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the E. Indies; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her special colour—dark or comparatively fair—as any lady of Britain or France. India in this manufacture stands unrivalled, and it makes some very gorgeous shaniamans and elephant saddle clothes. The gold and silver fancy fringes of Hyderabad are well known in India. Solid silver wire fringes and ornaments are made in Madura, but they are surpassed by the silver thread of Hyderabad.

In the embroidered fabrics of India, it may be mentioned as a principle, that patterns and colours diversify plane surfaces without destroying or disturbing the impression of flatness. They are remarkable for the rich division shown in the patterns, the beauty, distinctness, and variety of the forms, and the harmonious blending of several colours.

In Burhanpur, most of the people are dependent in one way or other on the wire-drawing and cloth-weaving industries of the place. The value of its fine fabrics depends mainly on the purity of the metals employed in the composition of the wire, and to secure this the wire-drawing has always been kept under Government inspection. A hereditary tester, called the chaukshi, received and asayed all the silver and gold brought to the taksal or mint (where the Burhanpur rupee was also coined), and here the wire was drawn out to a certain degree of fineness before being allowed to pass again into the hands of the manufacturers, an arrangement still continued by the British. The drawing takes place only at Burhanpur and Lodhipur, a suburb of the old city. The silver bars are covered with a thin gold leaf weighing from four to forty-two masha (of fifteen grains troy each) to each pasa, that is, from about half to six per cent. on the amount of the silver. The number of masha employed is called the rang (colour) of the wire. The adhesion appears to be effected purely by mechanical skill on the part of the workmen, called pasa tana. It is then passed by the same workmen through a series of holes in steel plates, and dried while the wire, by means of copper, is applied by means of a spoked wheel of the rudest construction. It is passed through forty of these holes before it leaves the taksal, and is then reduced to about the size of an ordinary sodawater wire. Thence it goes into the hands of another set of operatives, called tana, who still further reduce it through a gradation of forty more holes, the last of which is as fine as a human hair.

Their apparatus is of somewhat more delicate construction, but the work requires neither the same skill nor hard work as the first operation. The wire is drawn by them down to various degrees of fineness, according to the work for which it is destined. The round wire is then given to the chauria, who flatten it into an almost impalpable film, by hammering between two polished steel surfaces,—an operation requiring, it is said, superior skill. In this state it is termed badla, and is used in the last stage of work. The inner part of it has, however, to be spun into a thread along with silk before being woven up. This is done by persons called bitai, who use no sort of apparatus for the purpose, excepting a couple of wooden spindles twirled by the hand. Indeed, the beauty of the result obtained by such primitive implements must strike every one with amazement. The layer of gold on the finest wire must be of almost inconceivable thinness. The mixed thread is called kalabatun, which is woven into the kimkhab and other brilliant fabrics worn by rich natives on high occasions.

The wire-drawers were originally Pathans, introduced from Upper India by the emperor Akbar, but now all castes work at the trade. The fabrics are of many different sorts, many of them of great beauty. Kimkhab (vulgarily kimno), which is of mixed silk and gold thread, is now little made in Burhanpur, the Ahmadabad and Benares articles, from being produced both cheaper and nearer the great markets for such stuffs, having driven it out of the field. The same may be said of mashroo, a fabric of silk warp with the wool of cotton thread, wrought with a pattern in kalabatun; though made to a small extent, it is greatly inferior to the produce of Ahmadabad. The chief fabrics still made in the city are zari, a very light rich stuff, in which the flattened wire is interwoven with silk in the warp with a thread wool, chiefly made up into scarves and sarees worn by females on wedding and other high occasions. Salari is half silk and half thread, with brilliant edging and borders of silk and gold thread, mostly in the form of sarees and do-pattas; pitambar, all silk with the same edging, is a better sort of the same. Turbans, sashes, etc., are made in all these fabrics. The gold thread also is much woven up with silks into rich borders and edgings, exported to be attached
to the cloth manufactures of other places. Silk for these cloths is all imported; it is mostly from China, generally spun and dyed in fast colours at Poona. A little, however, is spun in the city from the material imported raw. The cotton thread used is extremely fine, and is both English and made on the spot. The former costs in Burhanpur exactly one-fourth of the latter, but it is greatly inferior both in strength and cleanliness. The closely-twisted native thread breaks with a sharp crack, while that English article, from its flabby, open charred parts without any noise. The English thread, from its cheapness, has, however, supplanted the native for all but the finest stuffs. The city thread is spun by the families of the weavers and others, the best being produced by the Balahi or Dher caste. A coarser thread is generally spun throughout the country by the women of almost every caste. It is woven into every description of common cloth by the Burhanpur weavers, even the best of them, when out of fine work, having to take to the commoner stuffs. The latter now greatly preponderate in quantity. The supersession by the rough-and-ready Maharrattas of the luxurious Mahomedan princes and nobles, was probably the first blow to the trade. The average earnings of the weavers range from about five to ten rupees a month, besides what their families earn by spinning, dyeing, and odd work connected with the trade.

Among the manifold and various manufactures of China, the gold and silver tissue cloths of Pekin stand deservedly in high estimation; their chief value arises from the peculiar property which they possess of never tarnishing or becoming dis-coloured.—Dr. Watson; J. B. Waring, Masterpieces of Industrial Art, Exhib. of 1862; Williams' Middle Kingdom; Boyle, Arts of India.

GOLDEN FOOT, a title of the king of Burma.

GOLDEN ISLAND, or Chinas, is in the middle of the Yang-tze-kiang, or great river of China, where the width is near three miles. It is the property of the emperor. It is interspersed with pleasure-houses and gardens, and contains a large monastery of priests, by which the island is almost entirely inhabited.—Macartney's Embassy.

GOLDEN LILIES, a translation of the name given to the cramped feet of the women of Chinese origin. It is not practised by the Hakka, a race of ancient Chinese stock who emigrated from Northern to Southern China about the 13th century; nor amongst the Manchu, nor amongst the hill tribes of Formosa.

GOLD FISH, Cyprinus auratus, seem to have long been known in China, and were introduced into Britain about the 15th or 16th centuries. They are seldom seen in India, but are very common in the Mauritius. They are supposed to be of accidental production, as they are not found wild, and their fins and tails highly vary.

GOLD-LEAF. Kin-poh, Chin. This is roughly made in China, and largely exported to India. In China suicides swallow it, as also gold-dust: these produce mechanical irritation and death. — Smith.

GOLD MOHUR, also called Ashrupee, a gold coin, value about fifteen or sixteen rupees.

GOLD, OXYMEL of Kin-ising, Chin. The Chinese regard this as an elixir vitae.—Smith.

GOLDSMITH, one of the five artisan castes among the Hindous of India, the other four being the blacksmith, carpenter, brazier and stone-cutter. These all wear the pootn, zonar, or sacred cord, and do not reverence Brahmanas. Those in the Malabar country follow the rule of descent by the mother, and their women are polyandrists. In Western India they are distinguished by their country, as Marwari, Gujarati, Cuchhi, or Dakhani, and work at ornaments worn by people of their respective castes or countries. The Cuchhi are the best workmen. Usually the intending purchaser finds the gold or silver, and the artisan charges from three annas to two rupees and upwards per tola, according to the simplicity or richness of the design. A large number of articles in gold and silver are annually made at Bhooj, Guibadan, or rose-water sprinklers, are manufactured for native use. The silver and gold used is very nearly pure. The charge is at the rate of 8 annas per tula weight.

GOLD-THREAD is largely used in the embroidery of India. There should not be any alloy whatever in the gold or gilt silver thread used. This alone can preserve it from tarnish; and as gold thread enters very largely into the patterns of most native cloths, it would be impossible to make any of high value acceptable without it. In its manufacture, a small bar, ¼ inch diameter and about 6 inches long, of the purest silver, is trebly or quadruply gilt by the highest touch gold; there is no alloy whatever used in the highest kinds, but the value of the thread depends upon the number of times the silver has been gilt with pure gold. The gilt bar is beaten out to a thick wire with carefully polished flat hammers, on a polished anvil, and afterwards drawn through a succession of holes in a plate, until the requisite fineness is obtained, which is hardly more, probably, than a fine hair. The wire is wound round upon reels, and is flattened by a delicate and peculiar manual operation as follows:—Three reels of wire are placed upright on the further side of a steel plate, perforated, through which the wire is drawn; the workman draws these wires towards him over a highly polished steel anvil, placed on a small stool, and as they pass strikes them sharply with a somewhat heavy hammer, the face of which is also perfectly flat and highly polished. The operation is very rapid, and must require great skill so as to ensure uniform flatness and perfection in the wire thus prepared for use. To make it into thread it is twisted upon silk thread of various degrees of fineness, as required, by a simple process as follows. The thread passes over a ring or hook a few feet above the operator, and then is wound upon a spool with a long Shank which hangs near the ground. A rapid twist is given to it by the workman, by rolling it sharply on his thigh, and as it spins the gold thread is directed carefully along, so as to cover the whole exactly as high as the man can reach. The spindle is then stopped, the covered thread wound upon it, and the operation resumed. It is doubtful, perhaps, whether any mechanical
GOLEEREE.

Go, a shepherd, grazer, or cowherd. A man of a caste whose duty it is to graze sheep or cattle. See Goala.

GOLAR or Goller, a race in India who are treasurers, cashiers.

GOLAR. Tel., KARN. A shepherd, grazer, or cowherd. A man of a caste whose duty it is to graze sheep or cattle. See Goala.

GOLOKA, the highest world, residence of Krishna; perhaps Go-loka, the cow-place.

GOLUK, a Hindu race in Woon.

GOLUNDA. Tel., KARN. A race, probably a tribe, of the Khasi, a branch of the Assam tribes, called Koli by the Mutart in the Census report of 1872. They are a race of sheep-herds, who live on the plains of Khasi hill, and go to the plains of the Ganges in the winter. They are a peace-loving race, and are not addicted to war.

GOLUNDA ELLIOTTI. Jerd. Bush rat. Mus hirsutus, Elliott. Mus cochen. Kelaart. One of the most interesting animals of the genus Mus of the island of Ceylon, is the Mus hirsutus of Balistis, which is a species of the same family as the M. rudis of the Ceylonese, and which is found in the jungles of Ceylon.

GOLUNDA ELLIOTTI. Jerd. Bush rat. Mus hirsutus, Elliott. Mus cochen. Kelaart. One of the most interesting animals of the genus Mus of the island of Ceylon, is the Mus hirsutus of Balistis, which is a species of the same family as the M. rudis of the Ceylonese, and which is found in the jungles of Ceylon.

The soft-furred field rat lives entirely in cultivated fields, in pairs or small societies of five or six. In 1826, owing to a deficient monsoon, they ascended in multitudes, and destroyed the seed grain and grain in the ear. The rats employed the Wadda to destroy them, but thousands were killed without diminishing their numbers. They are eaten by the Wadda race. It has only been found in Southern India.

Dr. Kelart describes G. newera as occurring in Ceylon.—Elliot.

GOMAL, a pass at the head of the Gomal valley, in lat. 32° 27', long. 70° 30' E., and about 100 miles long. It runs 20 miles from the entrance of the road to the N.W., then 80 miles S.W., then N.W. to Ghazni. This pass is of great commercial importance. Every spring large caravans traverse it from Hindustan to Afghanistan.

GOMASHTA. Hind. An overseer, an agent, an accountant.

GO-MEDHA. SANSK. From Go, a cow, and Mehta, flesh. A cow nourishing its flesh.

GOMEZ, Lorenzo de Gomez, a Portuguese, was the first of the European navigators who approached the northern part of the island of Borneo. He arrived there in 1531 in the ship St. Sebastian, on his route to China. He gave to the country the name of Burn, but he says that the natives term it Brannai or Brunai. The people have, however, no general name for the island.

This tree grows to the height of 30 feet on the continent of India and in Ceylon, and is common up to an elevation of 3000 feet. The wood is useful for building purposes.

GOMPHEREA GLOBOUSA. Linna. Ma-hyana, BURM. Gul birlikum, HIND. Jaffari gundi, DUKK. Lal-gul, URDU. Everlasting flower, ENG. Pedda goranta, TEL.

This flowering plant has a red and white variety, and the red resembles red clover. It is cultivated in gardens.—Roeb.; Mason.
GO-MUKHI.

which rises in the Aravalli mountains, and flows near Udaipur. It was dammed across by the rana, and the great Kankraoli Lake formed, 12 miles in circumference, at a cost of one kror and fifteen lakhs of rupees.

GO-MUKHI. HIND. A bag used by Hindu devotees; it contains a rosary, the beads of which are counted by the hand. Literally the two words mean cow's mouth.

GOMUTI. MALAY.

Uj, Sib,    . . . Mal. | Scho,      . . . Tel.
Sagw,      . . . Port.

The Tree.

Naw,     . . . Amb. | Abo, Areng, Indro, MALA.

Gomuti is a fibrous horsehair-looking substance, produced at the base of the petioles of the Arenga saccharifera, and superior in quality, cheapness, and durability to that obtained from the husk of the coconut. It has great power in resisting wet, and is used by the natives of the Indian islands for every domestic and naval purpose to which cordage is applied. The coarser parts are used as pens by all the tribes who write on paper, and as the arrows for blow-pipes or arrow-tubes. Gomuti, of all vegetable substances, is the least prone to decay; it is fastened like straw over bamboo thatch round the ends of posts placed in the ground, is mixed with mortar, and is plastered by the Bornoese into ornaments for the arms, legs, and neck. Gomuti fibre is in Europe occasionally heard of by the name of vegetable bristles, but only a portion of the fibres may be likened to stiff bristles, the greater part being more like black horsehair. Dr. Roxburgh, writing in the year 1799, strongly recommended the extensive introduction of this palm into India; and the Arenga now grows in Bangalore, and to some extent in the Nuggur division of Mysore. The palm-wine and the sugar it yields, the black fibres for cables and cordage, and the pith for sago, independently of many other uses, are objects of commercial importance. This palm is to be found in all the Asiatic islands, especially in low moist situations, and along the banks of rivers. The native shipping, all kinds are entirely equipped with the cordage of the gomuti. It undergoes no preparation but that of spinning and twisting,—no material similar to tar or pitch, indispensable to the preservation of hemp cordage, being necessary. The best gomuti is the produce of the islands farthest east, as Ambonaya and the other spice islands. That of Java has a coarse ligneous fibre; the produce of Matura is better. Gomuti is generally sold in twisted shreds or yarns. Besides the horsehair-like fibres, there is at the base of the leaves a fine gossamer-like woolly material, 'Baru, MALAY, Kawal, Jav., much employed in caulking ships, as stuffing for cushions, and as tinder. Eju was sent to the London Exhibition of 1861. The bundles of the coarse and fine fibres were about six feet in length, and about twelve inches in diameter, neatly tied up with split cane. Interspersed among the coarser were some finer fibres, something like black wool. The sinnet is coarse, but strong, and broke with a weight of 85 lbs., when coir of about the same size broke with 75 lbs.; but the comparison was not very exact. Besides making strong and durable cordage, the eju fibre is no doubt applicable to a variety of purposes for which horsehair and bristles are now employed.—Royle, Fib. Pl.; Seemann on Palms; Vout; Roxburgh; Morrison's Comp. Desc.

GONDA, also Gonaapat. HIND. Gunny: a coarse canvas or sackcloth made from the Corchorus capsularis (pat) and C. olitorius, of which the gunny sacks, cordage, and paper are made.—W.

GOND, the province of Gondwana, on the old maps was bounded on the S.W. and W. by the Godavery, Pranhita, and Wardha rivers, and the Kalagong Hills; the Nerbudda separated it from Malwa and Dumoh, and the boundary line ran N.E. along the Kutne, and on the N.E. side it had Berar and Chutia Nagpur. On the E. and S.E. it extended at least to a line drawn from Gangpur on the Brahminhi to Bhdraachalam, about 120 miles from the mouth of the Godavery, and included Simbulpore, Sompur, and Patna; but on Hamilton's map of 1820 it includes Kalahandi, Bond, and Singbhum. Its length from S.W. to N.E. was not less than 380 miles, and its average breadth fully 300, whilst its area was at least 115,000 square miles. Gond tribes are scattered over the mountain ranges of this territory, though they do not extend quite so far to the E. as it does. They are found extending into Sirajga on the N.E.; they are found in Karial and Kalahandi or Kharond, along with the Khand and Uriya. In the south, says Mr. Hislop, they form the mass of the population of Bastar, and a portion of the inhabitants of Jeyapore (in the Madras Presidency), while they occupy the hills along the left bank of the Godavery, about Nirmul; and on the west they are intermingled with Hindus of Berar for 30 miles from the right bank of the Wardha. The chief remaining sites of the aboriginal tribes of Central India is the Satpura plateau, divided among the British districts of Baitul, Chhindwara, Seoni, and the higher half of Mandla. Commencing from the west, one-half of the population of Baitul is Gond; in Chhindwara, the proportion is as high as three-fourths; in Seoni, which is traversed by the main line of communication through the plateau, it sinks to one-third, rising to one-half in the wild district of Mandla, where the last Gond kings held sway. To the east and west of this region, hill races of a different stock press in upon the Gonds, Kurku, Bhill, Baiga, Kol, and Dhangar.

The name Gond or Gundi, says Mr. Hislop, seems to be a form of Kond or Kund. Both forms are most probably connected with Konda, the Telugu equivalent for a mountain, and therefore will signify the Konda-wanu, hill people. And this name they must have borne for many ages, for we find them mentioned by Ptolemy, the geographer (A.D. 150), under the name of Gondaloi. But it has also been supposed to be a contraction of Govinda, literally cow-keeper. Of their history we know but little. Under all changes they appear to have preserved their own forms of worship and social habits; but some have adopted to a greater or less extent the forms of Hinduism, and a still fewer number have become Mahomedans. The Rajputs from Malwa seem to have pushed their conquests into the country and intermarried with them. Their descendants are still known as Rajputs or Gond Rajputs. They established governments, one of which ruled the Nerbudda valley, and had its capitals at Mandla and
at Garha, near Jubbulpur. It was founded by Jada Rai, who succeeded his father-in-law Nagdeo, the Gond raja of Garha (A.D. 358). Mandla was conquered by his descendant, Gopal Sa, A.D. 684. Sungram Sa, the 47th in descent from Jada, inherited only three or four districts in 1480; but at his death, in 1530, he ruled over fifty-two. Fergusht tells us that when Asaf Khan invaded Garha in 1563, Bir Narayan was raja. Hirdi Sa, the 54th raja, built the temple at Ramnagar, near Mandla; and Sereaj, the 59th, began to reign in 1742, when Balaji Bajo Rai invaded the country. A second kingdom had its seat on the southern slope of the Satpura Hills, at Deogarh in Chhindwara, one of the rajas of which, Bahadur Bahadur, was either taken prisoner by one of Aurangzeb's generals, or visited Delhi of his own accord, where he was converted to Mahomedanism, and then permitted to return to his country, where his descendants, say Mr. Hislop, though adhering to this change of creed, have not ceased to marry into Gond families, and hence the present representative of that royal house is not only acknowledged by the whole race about Nagpur as their head and judge, but is physically regarded a pure Raj Gond. A third Gond principality had its capital at Kherla in Baitul, to which belonged the famous forts of Gawilgarh and Narnalla. In 1493, its raja, Narasingh Rai, who is represented as powerful and wealthy, was slain in battle by Hushang Ghorii, king of Malwa, and Kherla taken. At a later date it appears to have become subject to Pandu Gauli, the raja of Deogarh, and continued so under his successors. Not far from Kherla we find a hill raja at Saoligad in Aurangzib's time, who seems to have maintained his independence till swept away by the Maharratts between 1760 and 1775. A fourth Gond kingdom was that of Chanda on the Wardha, which extended far to the east and south-east. The four kingdoms arose before the ascendency of the Moghuls in India, and have left architectural and other monuments of great interest. The principal architectural remains are at Mandla, at Garha near Jubbulpur, at Chaurnar near Narsingpur, at Deogarh near Chhindwara, at Kherla near Baitul, and at Chanda. But besides the preceding kingdoms, there was also a Gond Rajput dynasty at Warangal or Orankal in the Dekhan, to the south of the Godavary, which is said to have been founded by Kakati of the Ganapati family about A.D. 1082. The kingdom became very powerful about the end of the 13th century, and the raja of Orissa, becoming jealous of his neighbour's power, solicited the aid of Ala-ud-Din, who sent an army, routed the Bengalis, and dispersed the whole of Kafur; but his expedition failed. Malik Kafur was then despatched with 100,000 horse into the Dekhan, and, after a siege of some months, he took Warangal in 1309, and made the raja, Ladder Deva, tributary. In 1321 it was again besieged by Alif or Jema Khan, the son of Ghaiaus-ud-Din Taghalagh, but he was obliged to retreat with the loss of nearly his whole army. He returned, however, and in 1323 reduced the place, and carried the raja prisoner to Delhi. It is said he was afterwards released and restored; at all events Warangal reasserted its independence in 1344, and assisted Hasan Ganga, Bhumani, in his revolt. From this time the Bahmani kings of Kulkurru involved the native rajas in continual wars. Firoz Shah (1397-1422) especially obtained great successes over the raja of Kherla; and finally Ahmad Shah, Wali, took permanent possession of Warangal, forcing the raja to relinquish his ancient capital and flee northward across the Godavary, where he established himself in wild independence among the inaccessible forests. The Gond rajas still maintained their independence, however, and in 1513 we find them joining in a powerful confederacy on the side of Medon Rai against Muhammad ii. of Malwa. At the close of the 16th century, Akbar reduced the western portion of Gondwana, but it was not till the middle of the 18th that permanent progress was made. About 1738, Raghunu Bhonsla interfered in a disputed succession in Deogarh, and secured half the revenues; but in 1740 for Gond rajas in the direction, which Baghrujo quelled, and annexed the principalities of Deogarh and Chanda to his own dominions; and in 1751-52 he took the forts of Gawilgarh, Narnalla, and Manikrug, with the districts dependent on them.

From this period large numbers of Mahrattas settled in these districts, the Gonds became more restricted to the hills, and they do not now form any considerable part of the population of the plain or champaign country. They predominate from Sirgajwa westward along the line of the Satpura Hills, through all the hilly country of the districts of Mandla, Jubbulpur, Seoni, Chandwara, Baitul, and Hoshungabad, and in some degree to the neighbourhood of Asirgarh. The Gond of Berar is a hill race, occupying the Mailihat and the southern skirts along with the Anhil, the Kolamb, and Karku. All these have a physical resemblance, but each of them speaks a different language, and in features they are quite distinct from the people of the villages. There are 8000 of them in the Amraoti district. In the Central India Provinces the chief Gond tribes are:—Bhatra Gond, Mari Gond, in Chanda; Mariiah or Gottawar, Upper Godavary; Khutolwar, in Chanda; Durveh, of Chanda; Aguriah, of Mandla; Hulta, of Upper Godavary. Their numbers have been variously estimated up to 2,000,000, partly under feudatory states, as Bastar, Hyderabad, etc., and partly under the British Government, in the Central Provinces.

The Gonds divide themselves into twelve and a half castes, viz. Raj Gond, Raghuwul, Dadare, Katula, Padal, Dholi, Ohjyal, Thotly, Koilabhatul, Koikopal, Kolam, Madyal, and an inferior sort of Padal as the half caste. The census of 1881 names nine of them—Raj Gond, Padhar, Kolam, Koilabhute, Darwe, Thakur, Bucheria, Boy, and Koikopal. The first four, together with Mr. Hislop, with the addition, according to some, of the Kolam, are comprehended under the name of Koitor,—the Gond par excellence. This term, in its radical form Koi, is the name given also to the Meriah sacrificing tribes of Orissa, and to the wild tribes skirting the left bank of the Godavary from Rajamundry to near the mouth of the Indravati. The Persian word Koh, a hill, approaches this more closely than even the Telugun Konda. The Koitor, as a rule, resent with no small vehemence the imputation of belonging to any portion of the Hindu community. The first three classes generally devote themselves to agriculture; the fourth includes those who have begun to conform to the Hindu religion and ape Hindu manners. The Padal, Patladi, Pardhan,
or Dessi, called Raj Pardhan to distinguish them from the Mahendi-speaking half-caste,—who play on wind instruments of brass, and spin cotton thread,—are the religious counsellors or bhata of the upper classes. The Dholi are musicians; and a subdivision of them in jungly districts are employed as goatherds. The Ojhyal are wandering bards and fowlers. The Thotyal (i.e. maimed) or Pendabarya, ‘minstrels of God,’ are also called Matyal, because their songs are chiefly in honour of Mata, the dreaded goddess of smallpox. They make baskets also. The Kollabhalu are the third wandering caste, and their women are dancing girls. They follow their profession chiefly among the Hindus, it being reckoned disreputable by the people of their own race. The Koikopil, i.e. Gondi Gopali, are a settled class devoted to cow-keeping. The Madya, called Jhola in Bastar, are savages on the Bella Dila Hills, and in the remote parts of Chanda. The only clothing the women wear is a bunch of leafy twigs fastened with a string round their waists, to cover them before and behind. In this they resemble the Juangar to the south of the Kol country, the Chencheri near the Pulicat Lake and to the north of Ellore, and till about A.D. 1830 a similar custom existed among the Holier near Mangalore. The Kolam extend along the Kandi Konda or Pindi Hills, on the south of the Wardha river, and along the table-land stretching east and north of Manikgadh, and thence south to Danttanapalli, running parallel to the right bank of the Pranhita. They do not intermarry with the common Gond, but the one attend the nuptials of the other, and eat from their hands. Connected with the Gonds, though not included in the preceding classes, are the Madiya between Chindwara and the Mahadeva Hills, who have conformed to the Hindus in their language and some religious observances; the Halwa, pretty numerous in Bastar, Bhandara, and Raipur, who covet the distinction of wearing a sacred thread,—a privilege, till recently, sold to those in Bastar by the raj: the Gaiti Gonda in Bastar, who call themselves Koitor; the Moria Gonda, who are the principal agriculturists in Bastar; and the Naiknde Gonds, inhabiting the jungles on the banks of the Pain-Ganga, and especially the tracts between Digaras and Umarked, and found about Aparawa-pet, and as far as Nirnul, who have adopted the Hindu dress, and will not eat beef; but they live by the chase, or cut wood and grass, and have been a terror to their neighbourhood by their depredations.

Quite distinct in language at least from the Gond tribes, are the Kur or Musai and the Kurku to the N.W. and W. of the Mahadeva Hills. Of the latter of these, Mr. Elliot gave interesting details in the second number of the Journal of the Antiquarian Society of the Central Provinces. They belong to the Kol or Munda family.

The Gond religion is as distinctively of Scythian origin as is their language and physique. Earthenware figures of the horse are offered instead of the living sacrifice. They propitiate the manes of their ancestors by offerings of these earthenware horses, rice and other grains, eggs, fowls, or sheep. The sacrifice of the cow was prohibited by the Bhonsla government. Children everywhere, and many adults, are buried, but the Madia of Bastar and the Gond races who have conformed to Hindu customs burn their dead.

They have in all about thirty divinities, but two of these, Barra Dewa and Dula Dewa, are most worshipped. The Creator, under the name of Bhagwan, is occasionally worshipped in their houses by prayers, and by burnt-offerings of sugar and ghi, but their chief worship is to the inferior divinities; these are—

1. Bana Dewa (great god) or Budhal Pen (old god), who is the same as the Bura Pen of the Kond race, and appears to be the same as Rayetal, or the sun-god, represented by an iron tiger three inches long; and is probably the same as the Marung Bura of the Santal. He is worshipped once a year, at the rice harvest, and a hog is then sacrificed to him. Among the Gaiti he is represented by a copper piece, kept in a tree in the jungle. This they take down at the animal festival, clear a space of about a foot square under a tree, in which they lay the pice, before which they arrange as many small heaps or handfuls of uncooked rice as there are deities worshipped by them. The chickens brought for sacrifice are loosed and permitted to feed on the rice. Goats are also offered, and their blood presented in the same manner. On the blood arrack is poured as a libation to their deities. The pice is now lifted and put in its bamboo case, which is shut up with leaves wrapped in grass, and returned to its place in the tree, to remain there till it be required in the following year. Both Budhal and Matya (about to be noticed) are said to be sometimes of iron, and a foot long.

2. Matya, called Mata by the Kurku, is both the god (or goddess) of the much-dreaded scourge smallpox, and of the saj tree. The Goi, who are permitted to represent Matya as the attendant or kotwal of Budhal Pen, and they offer him a pig. The Kurku suppose Matya to reside inside the village, and they make offerings of cocoanuts and sweetmeats, but no blood.

The Gond have no images in their houses, and at their religious ceremonies they employ only the rudest symbols,—knobs of mud, stone, iron rods, pieces of wood, chains, bells, etc. Their festivals are associated with their crops, and are celebrated under the saj tree or em tree three or four times in a year, as on the occasion of the commencement of rice sowing, when the rice crop is ready, and when the mahua tree (Bassia halloc) comes into flower. In the south of the Bandara district are to be seen squared pieces of wood, each with a rude figure, carried in front, set up somewhat close to each other. These represent Bangaram, Bangara Bai, or Devi, who is said to have one sister and five brothers, the names of the latter being Gantaram, Champaram, Naikaram, and Pottinga, the sister being known as Danteswari, which is a Hindu name of Kali. These are all deemed to possess the power of sending disease and death upon men, and under these or other names seem to be generally feared in the region east of Nagpur city. At Dantewada, in Bastar, about 60 miles S.W. of Jagdalpur, near the junction of the Sankari and Dunkan tributaries of the Indravati, is a shrine of Danteswari, at which, about 1885, it is said that upwards of 25 full-grown men were immolated on a single occasion by a late raia of Bastar. Since then numerous complaints have reached the authorities at Nagpur of the continuance of the practice, and up to 1883 the conduct of the ruling rajah continues
unsatisfactory. Amongst the Moria Gond, Bhabwani is worshipped as the smallpox goddess, and as Maoli or Danteswari.

3. Sate or Nal, or, according to the Gaiti Gond, Saleng, sits on the same gadhi with the great god, to whom he is said to be nearly equal. An offering of a she-goat is made to him, and he is probably the protector of cattle.

4. Gangara, Ghangara, Gagaral, Gongara Mal, is the bell god, and is represented by a bell, or by an iron chain of four links.

5. Polo, of whom only the name is known. The suitable offering to Gangara and him is a cow.

6. Gaduwas the god of the dead, and is perhaps the same as Chawar, and identical with Dichiha of the Chaibassia Kol.

7. Kham or Kank, the last of the seven deities (Sat dewala), is worshipped under the saj tree (Pentapenta tomentosa).

Kodo Pen is besides these seven, and is the horse-god, common to the Gond and Kur. Mr. Driberg supposes him to preside over a village, and thus he would correspond to Nalza Pen of the Kond. But Mr. Hislop conjectures he may be the god of crops, Kodo, the Pasalum frumentaceum, being the grain chiefly cultivated by the Gonds. In the wilder villages near the Mahadeva Hills, Kodo Pen is worshipped by new comers near a small heap of stones, through the oldest resident, with fowls, eggs, grain, and a few copper coins, which become the profits of the officiating priest.

Mutua or Mutya Dewa, among the Kurku, is a heap of small stones inside the village, besmeared with sandur, red lead. He is associated with the prosperity of the village, and is worshipped with a goat, coconuts, dates, and a ball of sandur paste.

Pharsi Pen or Pharsa Pot is represented by a small iron spear-head. This name may possibly be connected with Barchi (Hindi), a spear; and he may be Heru, Pen of the Kond, the iron god or god of war. Pharsa, in Gondi, also means a trident, which is an ancient Tartar weapon. He is worshipped every third or fourth or fifth year, at full of the moon Vasaksh, and on the occasion people assemble from great distances, and offering is made of a white cock, a white hog-at, and a white young cow. The ceremonies are conducted with great secrecy, and no Hindu or Gond woman even is allowed to be present. He is apparently the same as Dula Dewa, the god of the battle-axe of the Gaiti Gonds, who represent Dula Dewa by a battle-axe fastened to a tree. While Barra Dewa requires the sacrifice of a living animal, a fowl, a goat, a pig, on public occasions, Dula Dewa is a household god, to whom at times rice, flowers, and oil can be offered.

Hardal, at Anarkantak, is worshipped as the cholera god; but Mr. Hislop supposed this to be another name for Bural Pen. The Kurku style him Lalhradal, and he possibly is the same as the Gohem of the Chaibassia Kol.

Banegram is probably the god of fever, as among the Kol of Chaibassa, where he is associated with Dichali and Gohem, as also with Chondu, the god of itch, and Negra, of digestion.

Bhikawas or Bhim Pen is, in the Mahadeva Hills, the god of rain, where a festival lasting for four or five days is kept in his honour at the end of the monsoon, when two poles, about 20 feet high and 6 feet apart, are set up, and a rope attached to the top, by means of which they climb to the top of the pole, down which they then slide. Offerings of fowls, eggs, and grain are presented to him. All over Gondwana he is generally worshipped under the form of an unshapely stone covered with vermilion, or of two pieces of wood standing from three to four feet above ground, like those set up for Bungaram. Before these the Moria Gond regularly perform worship previous to sowing. A little S.W. from Bajar Kurd, however, and north of Parsenni, is a formed idol of Bhiwasa, 8 feet high, with a dagger in one hand and a barchi (javelin) in the other. A Bhumuk is the pujari or officiating priest, and the people worship on Tuesdays and Saturdays, making offerings of hogs, he-goats, cocks, hens, coconuts. At an annual feast the potali gives two rupees, and Hindu cultivators rice; the pujari takes a cow by force from the Gowar and offers it to Bhim Sen, in presence of about twenty-five Gonds.

Sasarkan is a pool in the Mahur jungle, where the Pain-Ganga is said to be engulfed. The Naikude Gond repair there, in pilgrimage, at the month Chatria, to a huge stone that rises in a gorge, and goes by the name of Bhim Sen, before which Naikude Gond mingle with Raj Gond and Kolam in worship. Towards evening the worshippers cook a little rice, and place it before the god, adding sugar. Then they smear the stone with vermillion and burn resin as incense; after which all offer their victims, sheep, hogs, and fowls, with the usual libations of arrack. The pujari appears to be inspired, rolls his head, leaps wildly about, and finally falls down in a trance, when he declares whether the god has accepted the services or not. At night, drinking, dancing, and beating tom-toms goes on, and in the morning they return home after an early meal. Those unable to leave home perform similar rites beneath a mahua tree.

Waghoba, the tiger god, is worshipped by the Nandus, and under the name of Bag Deo by the Kurku.

Sultan Sakeda is worshipped by the Kur. Sakal Dewa or Sakra Pen, the chain god, is worshipped in Sooni and elsewhere.

Sanyal Pen or Sanyal, the spirits of the departed, are worshipped or propitiated for a year after death; but persons of note, headmen of villages, or priests, are treated as gods for years or generations, and sacrifices are usually offered at their Shapana or shrines of earth.

The Gonds of Manella have the Lamjina Shadi, in which the betrothed lad serves an apprenticeship for his future wife. A Gond girl, however, may exercise her own will and run off with a man; but it is quite allowable for her first cousin or the man whom she has deserted to abduct her from the man whom she has chosen. The Shadi Bandhoni is a compulsory marriage. In the Shadi Baitho, a man goes to a near house. Widows remarry either to a younger brother of their deceased husband, or to some other man.

To burn dead men is deemed the most honourable mode of disposing of the remains; women are always buried. When the father of a family dies, if well to do, they clothe the corpse in a new dress, and bury or burn the remains; his spirit is supposed to dwell in the house till it be released. Till released, the spirit is the only object of worship in the house. After the funeral, a piece of turmeric and a piece are tied up in a cloth and suspended to
one of the beans of the house. When the time comes to lay the spirit, the cloth is removed, and, with a portion of the flesh of a goat or a pig, is offered to the village deity. A feast is given to the relatives and elders, and the release is complete.—Central Provinces Gazetteer; Sir Walter Elliot, in Journal Ethn. Soc.; Coleman, Myth. Hind. p. 297; Latham's Ethnol.; Mr. Logan, in J. Ind. Arch., 1853, p. 201; Malcolm's Central India, i. p. 361; Dalton's Ethn. of Bengal; Mr. (Sir George) Campbell, Ethn. of India, in J. B. As. Soc.; Report of Ethn. Committee of the Central Provinces, 1868, p. 7; Rev. Mr. Hislop's Notes; Wilson.

GONDA, a town in Oudh, in lat. 27° 30' N., and long. 82° E., is 28 miles from Faizabad. It gives its name to a revenue district with a population over a million. The great cultivating castes are the Ahir, 122,106; Kori, 110,916; and Kurni, 92,321. The Kahar, mostly servants and palanquin bearers, number 44,978. The Barwar are a predatory tribe of Hindus.—Imp. Gaz.

GONDANA MAHR., KARN. Called also Gondli or Gondhal. A tumultuous assembly in honour of the Hindu goddess Devi, celebrated in Mysore by Mahratta Brahmanas, with music, dancing, and the recitation of mythological stories, the performers being a low caste named Gondhal, who sing and dance. In some places the Gondhalis is the village drummer; sometimes he is a vagrant musician, dancer, etc. In Berrar, also, the Gondhalis is the village musician.—Hind.

GONDAR, the capital of the Amhara kingdom, stated by Hengin (1862) to have contained from 6000 to 7000 inhabitants, but it is said to have been totally destroyed by the emperor Theodore.

—Par. Paper.

GONÐNÍ. HIND. Cordis angustifolia, C. obliqua, and C. Rothii. The fibre of the bark is made into rope. The fruit of C. angustifolia is an orange-coloured, sweet, and rather mucilaginous berry.

GONDOPOLÁ. URIA? A tree of Ganjam and Gumsur, extreme height 45 feet. Bandy wheels and ploughshares are occasionally made of the wood.—Captain Macdonald.

GONG or Lou, a musical instrument of the south and east of Asia, composed of a mixed metal resembling bronze in appearance. It is in the form of a large flat basin, with a ridge, and when beaten with a mallet, covered with woven cotton or twist, emits a strong reverberating or singing bell-like sound. Its value is in proportion to the quantity of metal it contains. In China, gongs are suspended at the doors of courts of justice, where applicants for justice attend and sound. The gongs of China are made of mixed metals,—in 100 parts, copper, 82; tin, 17; iron, 1; nickel, traces. The metals are melted in a crucible, and poured out on an iron mould with a clay rim, and hammered while still red. The gongs are hard, but brittle, and are struck with a padded bamboo and gradually brought to the full sound. The Kayu kutch of the Malay is a wooden gong. It resembles the teponaztli of the Mexican Cordilleras.—Crawford; Burbridge.

GONI. HIND. Gunny. Goni cloth, gunny of Crotalaria juncea.

GONIKAR. HIND. A low caste employed to gather the areca nut from the gardens of the husbandmen in Mysore.—Witt. Gloss.

GO-NYEN. BUMB. A vine producing a pod 3 or 4 feet long, containing 10 or 12 beans, 10 inches in circumference. These beans, well boiled, are sometimes used for food.—Malcolm, i. p. 182.

GOZALSES. Ruy Gonzalez de Clavijo, an officer of the court of Henry ill, king of Castile, went to Samarcand as an ambassador in 1403, and returned A.D. 1408.

GOZALSES de Mendoza (Jo), author of a History of China, published at Rome A.D. 1585; at Antwerp 1596. It was translated into Italian and published by M. Fr. Avanzo at Genoa in 1586, and put into French by L. de la Porte, Paris 1600.

GONZALEZ. Sebastian Gonzalez de Tibaq arrived in Bengal in 1605, where he engaged in the salt trade, but took to piracy, and commanded a fleet of pirate ships; seized Sundwa in the Sunderbuns. He had a large force, and frequently ravaged Arakan and the Sunderbuns. He married the sister or daughter of the king of Arakan, but after a chequered career he sank into obscurity.

GOOAL or KOWAR. HIND. A cereal which, in the N.W. Provinces, is frequently sown with cotton, and given as fodder to cattle.—Elliot.

GOODA, also Goora. HIND. A temporary place of refuge; hence the designation of many towns in India.—Toôd's Râj., i. p. 298.

GOOGA or Gogo. In the Lower Himalayas of the Panjub there are many shrines to this mythological being. In one account he was a chief of Ghani, who was slain in war against his brothers Uurjun and Surjun, but a rock opened, and Goga sprang forth armed and mounted. Another account makes him the lord of Durd-Durehra, in the wastes of Rajwara, who died fighting against the armies of Mahmut.

GOOGUL, HIND., is met with in all the bazars of India. It much resembles myrrh; and is said by some good authorities to constitute the bulk of the article exported from Bengal as East Indian myrrh. Royle considers the Googul identical with the Ùdellium of commerce, and he ingeniously traces in Budleyum and Madelkbon, the Greek synonyma of Googul, the Ùdellion and mabylon of Dioscorides. A tree in the Saharapur garden, pointed out as the Googul tree, had scaly bark exactly conformable to Dr. Roxburgh's description of his Anmyris. Dr. Ainalie (i. p. 29) adduces as synonyma of Ùdellium, Kukul, Tam, Googul, Tel, Googul, CAN, HIND, Aflatun, ARAB, and Mukul, Pers. He describes the gum-resin as semi-pellucid, yellowish, or brown; inodorous and brittle; softening between the fingers; in appearance not unlike myrrh, of bitterish taste, and rather strong smell. He stated, however, that it was all brought from Arabia and from Persia, where the tree is called Darakht-i-mukul, but in the bazars of India it is said that the Googul comes from the hills.

Under the term Googul, however, the resinous exudations of several trees seem to be classed. Under the Gnereusea and Maharatta names Dioscop, and Googul, Dr. Gibson mentions two species of Cumarium, one in Canara and Sundra, on the ghats above, and the second species of great size...
cultivated near Bilgii and at Siddalpore. The choice gum-resins afforded by these trees are extensively used in the arts, and exported both inland and to the coast. Several plants undoubtedly yield the b?ellum of Scripture, and amongst others Bannalanodendron Roxburghii, Aru., B. pubescens, Stocks, of Sind, B. Mokul, Dravy, B. gibra, W. and A., B. Africanum of Senegambia. Olibanum is produced from species of Boswellia, described by Avicenna, evidently referring to the libanum of Dioscorides, who mentions both an Arabian and an Indian kind. The latter, Mr. Colebrooke proved to be the produce of Boswellia serrata, Razzh, (B. thurifera, Celebro), the Salai or Saleh, Gond., of the Hindus, common in Central India and Bundelkhand, especially about the Bismunughe ghat. It is probably also produced by B. glabra, which has the same native name, and though extending to a more northern latitude, is distributed over many of the same localities. To this kind, according to Dr. Anstie, the term General is applied by the Telugu people. The resin of both species is employed as incense in India. Central India alone furnishes the greatest portion of the Indian olibanum of commerce, as it is chiefly exported from Bombay.—*W. Ill.; Razzh; O'Sh. p. 287; Royle, Prod. Res.; Anstie; Gibson; Birdwood.

GOOGL, a fibre supposed to be obtained from the Isora corylvolia, the Valumbi-kaya of the Tamul language.

GOOHA. Sansk. A secret place, from Goh, to hide or cover; hence Gohoya, requiring to be concealed. See Gulya.

GOOR. Duki. Jaggary, Hind.; Nulla vellum, Tam.; Bellum, Tel. A coarse sugar obtained from the sugar-cane and the various palm wines, particularly that of the Phoenix dactylifera. Twelve pints of the sap are boiled down to one of goor, and four of goor yield one of good powder sugar. It is not sugar, nor is it molasses, but both together.—Sinnam.

GOOR. Bahram Goor was famous for his liberty, gallantry, and love of the chase. He was the monarch whom the Greeks and Romans styled Varanes, and was the fourth monarch of the family. The famous impostor Mani, founder of the sect of Manicheans, made his appearance in this king's reign, and was put to death by the king. Bahram Goor is said to have visited India in the fifth century, and to have left progeny there by a princess of Kanauj. See Gor.

GOORAKOO, Goodakoo, or Goodakh, Hind., called in Bengal Tambaku, the name given in the Peninsula of India to the compound of tobacco for the hookah; from Goor, raw sugar, and Akoor, Tel., leaf.—Herklots.

GOOSE.
GOPADITYA.

Gopi, a herdsman. Gopi, a herdsman. From Go, Sansk., a cow. Immense numbers of the Ahir or Gopa of Northern India still cling to the nomadic life of their ancestors. Seeking the high grazing grounds of Central India and Western Bengal, they form encampments on the pasturage lands, where they reside with their wives, families, and herds, till the grass in the neighbourhood is exhausted, subsisting entirely on the proceeds of their milk and butter. The houses they use are constructed of large bamboo mats; they can be taken to pieces and removed like tents. A large section of the tribe have settled down as farmers, and are only distinguishable from other agriculturists by a possession of larger herds of cattle, by the greater care bestowed on them, and in profiting more by the sale of butter and milk. As the Doljatra festival begins on the 14th day of the light half of Phalguna, or about the middle of March, the image of Krishna is put into a swing at dawn, noonday, and sunset. The caste of Gopas or cowherds is everywhere profoundly conspicuous in this ceremony, especially so amongst the Uriyas; and they renew their own garments and all the harness equipments of their cattle. They also bathe them, and paint their foreheads with sandal and turmeric.

The race known to Europeans as Goala in Singbhum and the adjoining Tributary Mahals of Katak (Cuttack) and Chutia Nagpur, especially in Keonjhar, are the most flourishing of the peasantry, though the Bhuiny or Kol are the dominant races. In Behar there are several subdivisions, as Bhota, Bunarusa, Kanoujia, and Choutaha. It is pronounced as Gwal. The Sadgop, literally chief or superior Gopa, is now more an agricultural than a pastoral race. The Gareri are a shepherd race, to which the Gaekwar belongs.—Dalton's Ethnology of Bengal, p. 314; Elliot.

GOPADITYA, the successor of Deva Twasha, and grandson of king Yudishtira.

GOPALA and Govinda, common names of Krishna. Gopala is from Go, a cow, and Pala, nursing; a herdsman. See Chaitanya; Krishna; Rdra Sampradaya.

GOPAMOW, a town in Oudh, from which the Nawabs of the Karnatic came. Anawar, the father of Anwar-ud-Din, died there; his son, Anwar-ud-Din, was killed in battle at Ambur. Anwar-ud-Din's son, Muhammad Ali, died at Madras in 1795. Muhammad Ali's son, Oomdut-ul-Umra, died 1801. Azim-ud-Dowlah, the nephew of Oomdut-ul-Umra, succeeded, and died in 1818. His son, Azam Jah, died 1824; and the last nawab, Muhammad Ghous, died 1855. The family were then designated with the title of Prince of Arcot.

GOPANG, a Baluch tribe in Dehra Ghazidistrict.

GOPASHTAMI, the eighth day of the light half of the month Kartik (Oct.—Nov.), when cattle are fed, and decorated with garlands in commemoration of Krishna's passing his youth among the cow pastures of Brindavan. On this day, as well as on the Godhum (Covardhum), the day after the Dewali, garlands are suspended from the necks of cows; their horns, hoofs, and bodies are painted; and salutations are made to them. The whole ceremony reminds us of that observed on St. Anthony's day at Rome, when the beasts are sprinkled with holy water, and blessed by priests, as Elliot in Supplementary quotes:—

GOPURA.

Yet to me they seemed crying, alack and alas! What's all this white daisies to daisies and grass? Then they're brought to the Tope, and with transport they're kissed,

And receive consecration from Sancticy's fist.

GOP CHANDANA, a common magnesian clay, used by Hindus to make the sectarian marks on their faces, breasts, and arms. Vishnunara Hinduja employ a white earth from Dwarka, said to be the soil of a pool in which the Gopi drowned themselves on hearing of the death of Krishna. It is also described as an aluminous yellow earth, brought from the Ganges at Hardwar, and used to mark the foreheads. It is also given in medicine.—Gen. Med. Top. p. 131. See Tripundra; Vibhuti.

GOPESWARA and Barahat are two towns in Garhwal, from which were received two bronze tridents, respectively 21 and 16 feet high, with an inscription in semi-barbarous Sanskrit without date. In the more recent inscription on the Gopeswara trident, the invocation is Aum Svasti; and the spot is called sacred to Mahadeva. The tridents are precisely of the form of the trident on the Indo-Scythic coins, with the axe attached to the shaft. The oldest inscription is Bhitish; however, from the form of the Deva Nagara cannot be before the 7th century—are in relief upon the shaft, and make no mention of Mahadeva or Hinduism; but the more recent are cut into the trident, which must have been taken down to admit of the incision. In one of these is the Aum and the name of Mahadeva, which had no association originally with the tridents.—J. B. As. Soc. v. pp. 347 and 485.

GOPHER WOOD, of which the Hebrew ark was built, is supposed by some to be the wood of Cupressus sempervirens, or common cypress. But some commentators have supposed this term to be squared or planed wood; others the cedar, others pitched wood.

Gopi or Gopin, a milkmaid, a herdsman; generally applied to designate the herdmamn of Brindabhan of Vrij, the native country of Krishna, with whom Krishna associated while a young man. Radha, daughter of Nanda, a pastoral chief, was Krishna's first and favourite love, and the stories of his Gopi life are much read by the Hindus. It is said that on one occasion, when the girls went to bathe in the river, Krishna stole away their clothes from off the river bank; and up to the present day, the Vrijma women, when they go to bathe, like the Gopi of old, leave behind their garments on the steps of the ghat, and make a rush to the water, thus giving a colouring of truth to the story. Gopini are the Gopi herdswomen. It is believed that the Rasmandal is typical of the zodiacal phenomena,—that the nine Gopini are the personifications of the Nourmangi, the nine nobles of music, or the Nourmangi, the nine passions, excited by the powers of harmony. There is much in the Hindu mythology that is founded on an astronomical basis,—much that perpetuates the early Vejio worship of the elements under a figurative garb.—Tr. Hind.

Gopi-Nat'ha. Sansk. A name of Krishna, from Gopi, the wife of a milkman, and Nat'ha, a lord.

GOPURA, also called Gopuran, a gate, a town gate; in Hindu temple architecture, the tower over the porch. There are numerous beautifully sculptured gateways attached to the larger
temples of the Hindus. On days of festivals, the figures of the deities are brought out of the temples through the Gopura, and placed in small open temples called Mantopa, to receive the adoration of the multitude.—Col. Myth.

GOR. PERS., and Gadha, HIND., mean the wild ass; and Bahram, the Vanues of the Greeks, was surnamed Gor from his partiality to hunting that animal. Various authorities state that Bahram Gor entered India in the 5th century, and left progeny by a princess of Kanjou.

GOR, a celebrated tribe, amongst the most illustrious of the Chauhan feudatories. A branch, until latter years, held Soopur, and about nine lakhs of territory. The Gor tribe was once respected in Rajasthan, though it neither has any considerable eminence. The ancient kings of Bengal were of this race, and gave their name to the capital, Lucknow. Colonel Tod has no doubt that the Gor appanage was wasted to the Indus, and that this tribe on conversion became the Ghor. Ferris writes concerning the proselytism of all the Afghan tribes; but Colonel Tod is of opinion that the Afghans are converted Jadoun or Yaud, not Yalun or Jews.—Annals of the Bhatti; Tod's Rajasthan.

GORAH BUNDAR river flows between lofty hills, beautifully wooded, and studded here and there with ancient ruins, and huge masses of dark rock. The river abounds with crocodiles.—Postans' Western India, i. p. 179.

GORAI. HIND. A clan of Rajputs in the Agra district.—Wilson.

GORAKH or Gorakhnatha, the founder of the sect of Kanh-phata Jogi. He was contemporary of Kabir, and was personally known to him, and, like Kebir, Gorakhnatha is peculiarly an Oudh saint. The chief seat of his teaching was at the town of Gorakhpur, named after him; and he was the founder of the numerous sect of the Jogi or Kanh-phata Jogi, who in Oudh, in 1768, numbered 8642. Gorakhnatha's teaching, like that of Ramana, was addressed to the people, and his followers may be of any caste. His chief tenet was the possibility of acquiring in life entire command over elementary matter, by means of certain ascetic practices. This state is called Joga or Yoga, and the method of acquiring it is taught from the Patanjala school of philosophy.—J. Charles Williams; Oudh, p. 121.

GORAKHATHA, at Gorakhpur, is a temple, which, according to local tradition, was founded by Siva, in the second of Treta age. It was converted by Ala-ud-Din into a Mahomedan mosque. It was subsequently rebuilt in another place, but again appropriated by Aurungzeb to the Mahomedan religion, but subsequently restored. It is the most celebrated of the temples of the Jogi sect.—Wilson. See Jogi or Yogi: Naga Kuli.

GORAKHPUR, in lat. 24° 42' N., long. 80° 23' E., a town on the right bank of the Rapti, in the N.W. Provinces of British India, which gives its name to a revenue district lying between lat. 24° 5' E. and 27° 28' 25' N., and between long. 80° 7' and 80° 23' E., with an area of 4578 square miles, and a population in 1872 of 2,019,361 persons. Among the inferior castes, the Aahir are the most numerous, numbering 242,383 souls; but the Chamars nearly equal them, with a total of 210,108. The western part of Kosala—that is, Gorakhpur—continued some time under the Cheri, after other portions of that territory had fallen into the hands of the people called Gorkha (hence Gorkhapur, Gorakpur?), who were in their turn expelled by the Tharu, also from the north. The Tharu have left numerous monuments in Gorakhpur, and a few of them still remain in the district and in Mithila. They claim to be of the family of the sun, i.e. the Aryans, but are said to have strongly-marked Mongolian features. One of the rajas of this dynasty had for his chief priest a man named Rasu, of the impure tribe of Musahar. In Shahabad, also, the most numerous of the ancient monuments are ascribed to the Cheru, and it is traditionally asserted that the whole country belonged to them in sovereignty. Buchanan suggests they were princes of the Sunaka family, who flourished in the time of Gautama, about the 6th or 7th century before the Christian era. The Cheru were expelled from Shahabad, some say by the Savara or Sura, some say by a tribe called Harisa, and the date of their expulsion is conjectured to be between the 5th and 6th centuries of the Christian era. Both Cheru and Savara were considered by the Brahmins of Shahabad as impure or Mlechhas, but the Harisa are reputed good Kshatriyas.

The overthrow of the Cheru in Mithila and Magadh seems to have been complete. Once lords of the Gangetic provinces, they are now found in the Shahabad and Behar districts only, holding the meadst offices, or concealing themselves in the woods skirting the hills occupied by their cousins the Kharwar, but in Palenam they retained till a recent period the position they had lost elsewhere. They invaded that country from Rohtas, and, with the aid of Rajput chiefs, the ancestors of the Thakurs of Janka and Chainpur, drove out and supplanted a Rajput raja of the Raksahil family, who retreated into Sirgura, and established himself there. It is said that the Palenam population then consisted of Kharwar, Gond, Mar, Korwa, Parhaya, and Kisans. Of these, the Kharwar were the people of most ancient origin. The Cheru conciliated them, and allowed them to remain in peaceful possession of the hill tracts bordering on Sirgura; all the Cheru of note who assisted in the expedition obtained military service grants of land, which they still retain. It is popularly asserted that at the commencement of the Cheru rule in Palenam they numbered 12,000 families, and the Kharwar 18,000; and if an individual of one or the other is asked to what tribe he belongs, he will say, not that he is a Cheru or a Kharwar, but that he belongs to the 12,000 or to the 18,000, as the case may be. The Palenam Cheru now live strictly as Rajputs, and wear the polta or caste thread. They do not, however, intermarry with really good Rajput families. Intermarriages between Cheru and Kharwar families have taken place.—Dilaton, Ethnol. of Bengal, 126; Imp. Gaz.

GORAM. HIND. Literally, white people; a term applied to Europeans by natives of India, who call themselves Kala-log, or black people, also Kala-admi, black man.

GORAM, a group of three islands in the Eastern Archipelago. S.E. of Goram is a high group, composed of raised coral reefs 300 or 400 feet, with a volcano on the island of Teir, which broke forth in 1659. In the Goram group, at Manowoko, east of Ceram, a slight infusion of Papuan
on a mixture of Malay and Bugi has produced a

good-looking people. The Goram people are

wholly traders. Every year they visit the Tenimer,

Ke, and Aru Islands, the whole N.W. coast of N.

Guinea from Oetanata to Salwatty, and the islands

of Waigyu and Mysol. They also extend their

to Tidore, Ternate, Banda, and Ambonaya.

Their prahu's are all built by the Ke islanders, who

anually turn out hundreds of neat boats. The

Goram people trade in trepang, medicinal Missou

bark, wild nutmegs, and tortoise-shell, which they

sell to the Bugi traders at Ceram Laut and Aru.

—Wall, ii. pp. 53, 60; Bickmore, p. 243.

GORAYAT. Hind. The village watchman of

Hindustan. See Pasban.

GORDI, a fine race of Central India. Their

features and manners show them to be decidedly

Aryan, of a type less alloyed than that of most

castes. The old remains of former greatness, so

common in Central India, especially the curious

cairns and stone circles, are attributed to them.—

Sir G. Campbell, J. F. S.

GORDONIA FLORIBUNDA. Wall. The

A-nan-foo and Theet-ya of the Burmese. A

conspicuous tree of Moulnein, Chappedong, Tavoy,

and Martaban. There is some difference be-

tween the Tavoy and Moulnein trees; that of

Moulnein has leaves precisely like G. obtusa, with

shallow serration, but the leaves of the Tavoy

tree are quite entire, and the Burmese have
different names for them. The compact timbers of

Gordonia floribunda and Gordonia integrifolia

are called itch-wood by the Tavoyers, from the

itching which the chips or bark occasion when

brought in contact with the skin. The timber is

used for house-posts, and for rice mortars.

Malwa.

GORDONIA OBTUSA. Wall. Gordonia

parviflora, W. III. | Nagetta, NEELCHERRIES.

This very beautiful tree is very common on

the Neelgherry's, the Wynad, and throughout the

Western Ghats of the Madras Presidency, from

2500 to 7500 feet elevation. Its timber is white,

with a straw tint, even-grained, and pleasant to

work, and not unlike beech. It is very generally

in use for planks, doors, rafters, and beams, but

warps if not well seasoned.—Beddome, Fl. Syl.

GORDONIA SPECIOSA. Thuc. Garria

speciosa, Gardn. A large tree, 40 to 50 feet high,

rather uncommon, in damp forests of the central

province of Ceylon at an elevation of 5000 feet

GORDONIA WALLICHI is a common tree in the

Eastern Himalaya and in Sikkim; much prized for ploughshares and other purposes re-

quiring a hard wood. It is the Sing-brang-kan of

the Lepcha, and in Sikkim ascends to 4000

feet. Oaks at this elevation occur as solitary

trees, of species different from those of Darjiling.

There are three or four oaks with a cup-shaped

involure, and three with spineous involucres

enclosing an eatable sweet nut; these generally

grow on dry clayey soil. Gordonia Wallchii is

an erect and singularly handsome tree. It ascends

4000 feet on the mountains. In very dry soils it

is replaced by sal (Vateria robusta), and more

rarely by the Pinus longifolia.—J. As. Soc. Bengal,

GORDONIA ZEYLANTICA. Wright.

Var. a. lanceolata. | Var. b. elliptica.

Grows in forests of the central province of

Ceylon, at an elevation of 4000 to 7000 feet.—

GORGIAR. Hind. In Chutia Nagpur, a method

of settling village boundary disputes. The watch-

men of the two villages are buried up to the waist

in two holes, and whoever holds out longest is

the victor.—W.

GORGHEN, a river which rises in Kurdistan,

and, after a course of 120 miles, falls into the

Caspian. The Yonum Turkoman occupies its valley.

—Collett, Khiva (C. Asia).

GORY, a dynasty that ruled at Mandu, in Malwa.

Sultan Dilawar governed the province from A.D. 1357

but assumed independence 1401

Sultan Hoshang Gori, 1405

Ghazni Khan, 1432

Mamud Khan, contemporary of Rana Khumbe

of Chittore, 1435

Ghias-ud-Din, 1469

Mamud il, 1532

Malwa incorporated with Gujarat, 1564

Malwa annexed by Akbar, 1568

GORIWAR, an agricultural tribe in the Northern

Circars.

GOR-KHAR, or wild ass, Equus onager, has been

often confounded with the Kiang or wild

horse, E. hemionus; it inhabits chiefly the rather

hilly districts of Baluchistan, part of the sandy

plains of Sind; and another animal is to be found

to the westward of Baluchistan, in Persia, which

is called Kulan (Equus hemippus). Dr. Barth

has mentioned that, according to the description

given to him, he thinks the ass he saw in Africa

identical with the Gor-khar, or wild asses of Sind

and Baluchistan. The Gor-khar is also called

Khar-guddha. Though an inhabitant of the

Sind desert, it most abounds in the southern part,

about Dhalt, and the deeproot which extends

from Barmair to Banksirr and Bubairr along the

north bank of the Great Runn or Salt

Desert.—Todd's Rajasthan, ii. p. 328. See Kiang.

GOROWA, a Hindu caste who wear the janava,

yotnai, poitair, Sansk., and claim to have a gotra.

They are styled saiva Brahmans. They worship

the lingam as Siva or Mahadeo. They are

engaged in all civil avocations; and as agricult-

urists; are never soldierly. They are of a bamboo-

yellow colour, and are burly men. They do not

know where they came from, but reside in the

Western Dekhan. Qu. Gurao?

GOROWLI, a feudatory chieftaincy in Bunde-

khand, with an area of 50 square miles, a popula-

tion of 5000 souls, and a revenue of Rs. 15,000.

GORRE CHIMIDII. Tel. Andrographis eh-

oides, Nees. The name means sheep's mucus,

the whole plant being very viscus. Gore-

porous. Lea, sp., signifies sheeps's droppings.

GOSAIN, Goswami. From Go, Sansk., sense

or passion, and Sen, master. One who masters

or restrains his passions; modified vernacularly,

as Gosain. Sects of Hindus, whose discipless

are styled Gosami, Sami, Swami, Gosali, Gosavi,

Gosayi, etc. A religious mendicant in general.

As a special name, it is applied to very different

classes of persons, identified only by their profess-

ing a religious and mendicant life. The most

respectable are the reputed descendants spiritually

of Sankaracharya, of whom there are ten chief

branches, and who are thence also called the

Das-nami, or ten-named Gosains, attaching to the

ordinary Hindu appellation one of the terms,
Tirtha, or shrine: Astana, an order; Yana and Aranya, a wood; Sarsawati, the goddess of eloquence; Bharati, the goddess of speech; Puri, a city; Giri and Parvata, a hill; Sagara, the ocean;—as Awanda-gir, Vidyanaya, Puran-gir, Rama-Asrama. These, although they are occasionally vagrants, are usually assembled in marts, or conventional residences under a superior. Some of their establishments are liberally endowed, and of great reputed sanctity, particularly that of Sringeri in the Western Ghats, near the sources of the Tungabhadra, said to have been founded by Sankara himself. Individuals of the three pure castes are admissible, and in some cases Sudras also; but as they profess celibacy, their numbers are in part recruited by the purchase or adoption of boys at an early age.

The Das-nami Gosains worship preferentially Siva, of whom Sankara is said to have been an avatara, but many have been distinguished as advocates of the Vedanta doctrines. One division of them, termed Atits, differs from the more rigid Dandi Gosains, in following secular pursuits as traders and ministrant priests of temples. Some of them marry and settle, when they are termed Samyogi or Gharbharhi. These Gosains, although met with in Upper India, are most numerous and influential in the south.

In Hindustan the term is more correctly applied to two different classes, both worshippers of Vishnu,—the Gosains of Goluk, who are descended from Valabhabharya, and, although religious characters, are allowed to marry and follow secular pursuits; and the Gosains of Bengal, who are the disciples of Chatina, a native of Bengal, who instituted a new form of Vaishnava worship at the end of the 15th century. They also marry, and, like the Gokulashta, lead domestic and respectable lives. The term is also applied loosely to mere vagrants, some of whom wandered about formerly in armed gangs, and levied contributions forcibly on the villages, plundered them; or now, coming singly or in small bands, exact money by inflicting disgraceful tortures upon themselves; these sometimes go naked.

Gosain, female Gosain, Mahi, one who, on arriving at years of discretion, adopts a life of continence and mendicancy.

Dauri Gosai, Mahi, a class of religious vagrants said to be disciples of Goraknath, in which case they are not properly Gosains but Jogis. They sing hymns in honour of Bhairava, playing on the dura, or a small drum shaped like an hour-glass, whence their name Dauri, a player on the dura.

The ceremony observed at the initiation of a Gosain is as follows. The candidate is generally a boy, but may be an adult. At the Siva-ratri festival (in honour of Siva), water brought from a tank, in which an image of the god has been deposited, is applied to the head of the novitiate, which is thereupon shaved. The guru, or spiritual guide, whispers to the disciple a mantra or sacred text. In honour of the event, all the Gosains in the neighbourhood assemble together, and give their new member their blessing; and a sweetmeat called laddu, made very large, is distributed amongst them. The novitiate is now regarded as a Gosain; but he does not become a perfect one until the Vijayaj Hom has been performed, at which a Gosain famous for religion and learning gives him the original mantra of Siva. The ceremony generally occupies three days in Benares. On the first day the Gosain is again shaved, leaving a tuft on the top of the head, called in Hindi Chundii, but in Sanskrit Shikhi. For that day he is considered to be a Brahman, and is obliged to beg at a few houses. On the second day he is held to be a Brahma- charya, and wears coloured garments, and also the janao or sacred cord. On the third day the janao is taken from him, and the chundi is cut off. The mantra of Siva is made known to him, and also the Rudri Gayatri (not the usual one daily pronounced by Brahmins). He is now a full Gosain or Wan-Parrast, is removed from other persons, and abandons the secular world. Henceforth he is bound to observe all the tenets of the Gosains. The complete Gosain who have performed the ceremony of Vijayaj Hom are celibates. It is customary, therefore, for men not to perform it until they are forty or fifty years of age, as it involves the abandonment of the secular world and families. Gosains will eat food in the houses of Brahmans and Rajputs only. At death their bodies are not burned, but are either buried or thrown into the Ganges.

The Vaishnava Gosains observe none of the Hindu festivals except those of Krishna; but the anniversaries of the deaths of their founders are observed as such. They do not, says Mr. Ward, reject the mythology or the ceremonies of the Hindus, but they believe that those of Hari (Krishna) only are necessary. On the nights of their festivals, the initiating incantation may be heard resounding through the stillness of the night: 'Hari, Krishna; Hari, Krishna; Krishna, Krishna; Hari, Hari; Hari, Ram; Hari, Ram; Hari, Ram; Hari, Hari!'

In Northern India, the Vaishnava Gosains worshippers of Vishnu, called Goluk Gosain, followers of Valabhabharya, marry and follow religious pursuits; and in Bengal, Gosains who follow the doctrines of Chatina, are called Byragi and Sava Gosain. They sometimes come in conflict, and at Hardwar, on the Ganges, a celebrated place of pilgrimage, soldiers of the Bengal army had to keep the peace, long after a battle that occurred, about the middle of the 18th century, in which they fought almost to extermination. The descendants of Nityananda are Gosains of Khurda. The descendants of Adwaite are Gosains of Santipur, and there the principal idol is Shambhunath. But one-third of the people of Santipur are Vaishnavas.

The Gosai of Gujerat worship Siva. They wear orange-tawny clothes, and the tilak or sectarian mark upon their forehead is horizontal.

The priests of Eklinga are Gosain or Goswami. The high priest and his order are celibates, and the office is continued by adopted disciples. Of such spiritual descent they calculated 64 since the sage Hari, whose benediction obtained for the town Eklinga the name of Chittoro, when driven from Samratra by the Parthians. A numerous class of Gosains have adopted celibacy, who yet follow secular employments both in commerce and arms. The mercantile Gosains are amongst the richest individuals in India, and at Udaipur were thus useful when the Mahrattas demanded a war contribution, as their privileged character did not prevent their being offered and
taken as hostages for its payment. Gosains who profess arms, partake of the character of the knights of St. John of Jerusalem. They live in monasteries scattered over the country, possess lands, and beg, or serve for pay when called upon. As defensive soldiers, they are good. Siva, their patron, is the god of war, and, like him, they make great use of intoxicating herbs, and even of spiritual liquors. Mewar could always muster many hundreds of the Kaempfhat Jogi, or 'split-ea ascetics,' so called from the habit of piercing the ear, and placing therein a ring of the conch shell, which is their battle-trumpet. The poet Chand gives an animated description of the body-guard of the king of Kanouj, which was composed of these monastic warriors. The Iuna of Mewar, as the divan or vice-regent of Siva, when he visits the temple, supersedes the high priest of Eklings in his duties, and performs the ceremonies. The shrine of Eklings is endowed with twenty-four large villages from the fice, besides parcels of land from the chiefains.—Tod's Rajasthan; Tr. of Hind.; Cole. Myth. Hind.; Rasmalai, Hinda Annals, ii. pp. 312; Elliot, Sup.; Wilson's Glossary; Sherring's Hindu Tribes and Castes, p. 257.

GOSHA. HIND. Concealed. A Gosha woman means a woman who carries out the Mahomedan law of concealing herself from the sight of men, except certain near relatives. Many Hindu women, however, follow this rule. A Mahomedan ascetic is called a Gosha Nashin, who has withdrawn from the world and become an ascetic, or who lives a redusee life. It means sitting in a corner; and the term is applied to a woman of rank who is desirous to lead an ascetic life. The term for her is properly Gosha, or Parda, Nashin.

GOSHOO. HIND. Gold thread used to emboider caps.

GOSSYPIUM, cotton plant.

Gossypium, . . . . G. [Karpasa], . . . . SANNEK,
Kapasa ka jhar, . . . . HIND. Punjab,
Carbassus, . . . . EAT. Patti chetta, . . . . Tel.

The genus Gossypium, belonging to the natural order Malvaceae and its species, from the hair or wool which surrounds its seeds, are, next to food plants, the most important of the vegetable kingdom. Taking the population of British India and allied states at 250 millions, and allowing 10 pounds of raw cotton per man annually, the produce and yield of this plant annually exported may be taken at about 22 million cwt. There are several recognised species. De Candolle admits 13, and notices others. Two others were described by Dr. Roxburgh, and another in the Flore de Senebogam. Of varieties, Mr. Bennett says that he knows more than one hundred kinds, and they appear to him never ending. Dr. Royle was of opinion that the species may be reduced to G. Peruvianum (G. acuminatum), G. Indicum (G. herbaceum), G. arboresum, and G. Barbadense. Baron Fred. von Mueller (1880) notices as species — G. arboresum, Linn., the tree cotton; G. Barbadense, Linn., West India or Sea Island cotton, with its tall Egyptian variety called Bamia cotton; G. hisutum, L., upland or short-staple cotton; G. religiosum, Linn. (G. Peruvianum, Cavan.), kidney cotton, Peruvian or Brazilian cotton; G. Tattense, Parlatore (G. religiosum, Banks and Solander), and G. tomentosum, Nittal (G. Sandiviscus, Parlatore, G. religiosum, A. Gray).

There can be no doubt that the cotton plant is indigenous in America, and the species of the old world appear to be Indian and Chinese. Cloth manufactured from cotton has been brought from the tombs of Peru; and cotton seeds have been obtained by Rosselini from the monuments of Thebes. The Sanskrit name Karpasas has been taken into different tongues. The Hebrew word Karpasas of the book of Esther (i. 6) and the Latin Carbensas are derived from it; and the Karpasas mentioned in the Periplus of Arrian has been rendered by Dr. Vincent fine muslin. Pliny (ib. xix. c. 1) mentions the cultivation in Upper Egypt of a small shrub, called by some Gossypion, by others Xylon, bearing fruit like a nut, from the interior of which a kind of wool is produced. The species of the cotton plant grow in the warm tropical regions of America and Asia, but they are likewise extra-tropical; and Baron Humboldt mentions having seen it growing at 5500 feet in Mexico, and 9000 feet of elevation in the equinoctial Andes. It is largely grown in China. Dr. Royle mentions that it is cultivated in small quantities at 4000 feet of elevation in 30° N. in the Himalaya; and Dr. Stewart tells us that it is grown in many places all over the Panjab as a hot-weather crop, ripening up to Christmas, and that it is cultivated up to the Kashmir valley (5000 feet), but the quality does not appear first rate.—Rozb.; Dr. Stewart's P. Pl. p. 27; Cleghorn, Report, Br. Ass.; Eng. Cyc.; Royde, Prod. Res. of Ind.; Von Mueller.

GOSSYPIUM ACUMINATUM. Rozb. The
Brazil or Pernambuco cotton.

Wa-ku-la, . . . . BURN. Pamidi patti, . . . . Tel.

This species is indigenous, growing in the mountains of Bengal and in Malaicea. It is not cultivated; but as the wool is separated easily from the seeds, it is very desirable to make trial of it in agriculture.—Rozb.; Royde; Voigt.

GOSSYPIUM ARBOREUM. Linn. This tall perennial species, Nu wa, BURN., tree cotton, is found in Celebes and in every part of India. It is noticed among lists of the plants of Arabia, and also of Egypt. It is the New Orleans cotton (G. sanguineum, Hassk.). According to Dr. Wight, almost the only distinction between G. religiosus and G. arboresum is that the former has a yellow and the latter a purple flower.—Eng. Cyc.; W. Jc.

GOSSYPIUM BARBADENSE. Linn. This cotton plant, a native of the West Indies, is cultivated in India. It is called Barbadoes, Bourbon, Sea Island, West India, long-stapled, Upland Georgian, and short-stapled cotton. Swartz described this species as extensively cultivated in the West Indies. It is also one of the cultivated cottons of Egypt. Mr. Dellechheimer has noticed a new and almost branchless tall plant, exceedingly prolific, raised in Egypt, called Bamia cotton, which Sir Joseph Hooker considers to be a variety of G. Barbadense. It is more than probable that the Sea Island or long-staple cotton is a variety of this species, as its seeds agree in character. More than this it is not possible to say.—W. Jc.; Royle, Ill.; Rozb.; Voigt; Eng. Cyc.; V. Mueller.

GOSSYPIUM HERBACEUM. L.; Rozb.; W. Jc.; Ill.; Royle.

GOTAMA, founder of the Nyaya school of philosophy. He is called also Sattananda, also frequently Gautama. He was author of a Dharmasutra or law book.—*Doesen*.

GOTAMA SWAMI, a Brahman of the Gautama family, whose personal name was Indra-Bhuti. He became a disciple of Mahavira, often represented in Jain sculptures, especially in Karuatica, and on the Malabar coast. A statue at Sravana Belgola in Mysore is 663 feet in height; another at Yeni is about 35 feet; one at Karkala, 24 miles west of Yenur, is 414 feet high. An inscription is on the last. See Hoisala.

GOTHI, the high priest of a Jaina temple.

GOTHIIC, a branch of the Indo-Germanic stock of languages. The Goths consulted the heart of victims; had oracles, had sybils; had a Venus in Friya, and Parnac in the Valkyrie.

GOTRA. SANSK. A hurdle, a pen, a fold, a tribe. Professor Wilson explains the term Gotra as meaning a family, lineage, relationship by descent from a common ancestor of the same name, or from some saint, or regard him as a primitive spiritual head, and whose designation they bear, as the Bharadwaja-gotra, Kasyapa-gotra, Sandilya-gotra, etc. In vol. ii. p. 12, of the Hindu Theatre, Professor Wilson says it is asserted that thirteen Gotra or families of Brahmins owe their origin to as many divine sages called after their name. Kasypa (Kusip) is one of the number. The Aṣawalajana Sutra of the Rig Veda contains the enumeration of the Gotra, and their subdivisions, but in a very involved and unintelligible style. The popular enumeration of them, however, is not uncommon; but it is nearly, if not wholly, confined to the south of India, where several of the reputed representatives of these tribes yet exist. Throughout the entire Peninsula every Brahman claims his own Got; every marriage is regulated by the Got, and no Brahman marries into his own Got. Gotra, Vanea, Varina, Paksha, and Gana are all used, in a similar sense, to indicate the larger as well as the smaller families descended from the eight rishi. The care taken by all Brahmins in the S. of the Peninsula in making their marriage selections, justifies the conclusion that the genealogical lists of the Brahmins at the present day furnish in their general outlines a correct account of the priestly families of the Hindus. The eight rishi have eight Gotra, which are subdivided into 49 Gotra, and these 49 into a still larger number of families. In common practice they consider the same gotra as the same family, as in the more classical Gotra of Wilson's *Dictionary*. Properly, those only are Got which bear the name of some rishi progenitor, as Sandilya, Bharadwaja Vasishtha, Kasyapa; but it has become the custom to call each subdivision of a tribe a Got, and, according to the Nirnay Sind, there are no less than ten thousand. Early genealogies of the Rajputs frequently exhibit them as abandoning their martial habits, and establishing religious septs or Gotra. Thus Reh was the fourth son of Proorwa, of the Lunar race; from him, in the fifteenth generation, was Harita, who with his eight brothers took the office of religion, and established the Kausika Gotra, a tribe of Brahmins. According to Colonel Tod, both Got and Kaup denote a clan, and in Rajputana its subdivisions have the patronymic

GOTAMA SWAMI, a Brahman of the Gautama family, whose personal name was Indra-Bhuti. He became a disciple of Mahavira, often represented in Jain sculptures, especially in Karuatica, and on the Malabar coast. A statue at Sravana Belgola in Mysore is 663 feet in height; another at Yeni is about 35 feet; one at Karkala, 24 miles west of Yenur, is 414 feet high. An inscription is on the last. See Hoisala.

GOTE. HIND. Presents given at the birth of a child.

GOTHI, the high priest of a Jaina temple.

GOTHIIC, a branch of the Indo-Germanic stock of languages. The Goths consulted the heart of victims; had oracles, had sybils; had a Venus in Friya, and Parnac in the Valkyrie.

GOTRA. SANSK. A hurdle, a pen, a fold, a tribe. Professor Wilson explains the term Gotra as meaning a family, lineage, relationship by descent from a common ancestor of the same name, or from some saint, or regard him as a primitive spiritual head, and whose designation they bear, as the Bharadwaja-gotra, Kasyapa-gotra, Sandilya-gotra, etc. In vol. ii. p. 12, of the Hindu Theatre, Professor Wilson says it is asserted that thirteen Gotra or families of Brahmins owe their origin to as many divine sages called after their name. Kasypa (Kusip) is one of the number. The Aṣawalajana Sutra of the Rig Veda contains the enumeration of the Gotra, and their subdivisions, but in a very involved and unintelligible style. The popular enumeration of them, however, is not uncommon; but it is nearly, if not wholly, confined to the south of India, where several of the reputed representatives of these tribes yet exist. Throughout the entire Peninsula every Brahman claims his own Got; every marriage is regulated by the Got, and no Brahman marries into his own Got. Gotra, Vanea, Varina, Paksha, and Gana are all used, in a similar sense, to indicate the larger as well as the smaller families descended from the eight rishi. The care taken by all Brahmins in the S. of the Peninsula in making their marriage selections, justifies the conclusion that the genealogical lists of the Brahmins at the present day furnish in their general outlines a correct account of the priestly families of the Hindus. The eight rishi have eight Gotra, which are subdivided into 49 Gotra, and these 49 into a still larger number of families. In common practice they consider the same gotra as the same family, as in the more classical Gotra of Wilson's *Dictionary*. Properly, those only are Got which bear the name of some rishi progenitor, as Sandilya, Bharadwaja Vasishtha, Kasyapa; but it has become the custom to call each subdivision of a tribe a Got, and, according to the Nirnay Sind, there are no less than ten thousand. Early genealogies of the Rajputs frequently exhibit them as abandoning their martial habits, and establishing religious septs or Gotra. Thus Reh was the fourth son of Proorwa, of the Lunar race; from him, in the fifteenth generation, was Harita, who with his eight brothers took the office of religion, and established the Kausika Gotra, a tribe of Brahmins. According to Colonel Tod, both Got and Kaup denote a clan, and in Rajputana its subdivisions have the patronymic

---

GOTRA.
terminating with the syllable ote, awnt, sote, in the use of which euphony alone is the guide: thus, Sukawut, sons of Sukta; Kurmasote, sons of Kurma; Mairawut or Mairote, mountainers, sons of the mountain.—Eliot; Wilson’s Hist. Theatre; Wilson’s Glossary.

GOTTI GADDA. Tel. Spatithum Chinsene, Lour., syn. of Apojongeton monostachys, Linn. The roots are much prized as food by the Yanadí.

GOU-CHUNA or Go-chunee is a field of wheat and chune, or Cicer arietinum, sow together. The practice of sowing culminating and leguminous plants together is advantageous to the land as well as to the crop. Dew readily forms on the leaves of the chune, which would not form on the wheat, and this in seasons of drought is often the means of preserving both crops. Agriculturists in Europe sow clover with barley, flax, and oats, and Lent-corn.—Eliot.

GOUGH, HUGH, VISCOUNT, born in 1779, was the son of George Gough, Esq. of Woodstown, county of Limerick, Ireland. He entered the British army in 1791, served at the capture of the Cape of Good Hope and of the Dutch fleet in Saldanha Bay, 1795, and afterwards in the West Indies, including the attack on Porto Rico, the braggard war in St. Lucia, and capture of Surinam. He proceeded to the Peninsula in 1809, and commanded the 87th regiment at the battle of Talavera, where he was dangerously wounded. Had horses shot under him both at Barossa and Vittoria and Nivelle; again severely wounded at Nivelle; for which engagements he received the gold cross. He also commanded this regiment at the sieges of Cadiz and Tariffa, where he was wounded in the head. At Barossa his regiment captured the eagle of the 8th French Regiment, and at Vittoria the baton of Marshal Jourdan. He was nominated to the Mysore division of the Madras army in 1837, and in 1840-41 went in command of the land forces against China, for which services he was made G.C.B. and a baronet. On the 11th August 1843 he was appointed Commander-in-Chief in India; and on the 29th of December 1843, with the right wing of the army of Gwalior, he defeated a Mahratta force at Mahanpur, and captured 56 guns, etc.; and on the same day General Grey, commanding the left wing of his army, routed another body of Mahrattas at Lumnar. In 1845 and 1846 the army under his personal command defeated the Sikh army at Moodkee 18th December, Ferossalal 21st and 22d October, and Sobroon 22d February 1846, for which services he received the thanks of both Houses of Parliament, and was raised to the peerage. During the last desperate struggle with the Sikhs in 1848-49, he subdued the enemy at a great expenditure of human life. The next year he received from his sovereign additional rank in the peerage, from the East India Company a pension of £2000, and a similar sum from Parliament for himself and his next two successors. Sir Henry Hardinge, who was Governor-General, had voluntarily served under him as second in command at the battle of Ferossalal. He was gifted with great powers of combination and strategy, but his impulsive personal bravery, rushing into the midst of the battle, and by hurrying on one movement before the previous arrangement could be carried out, disarranged and rendered useless his own valuable plans. General Havelock said he was a man with a lust for danger. He excited the warmest attachment in his soldiers, and his zeal succeeded almost as well as Suwarrow’s. He never lost a battle,—for Chillianwalla, though a terrible destruction of life, was not a lost battle; and at Gujerat, where, for the first time in his life, he took advice and let artillery have fair play, he destroyed the most dangerous enemy, savagely. Ilyer Ali, the British ever encountered in India. The victory was due in no slight degree to the reckless daring with which he inspired all under his command.—Loud. Spectator, Men of the Time.

GOUGHIA, a curious large evergreen laurel-like tree, found by Dr. Hooker at Chating, in the Lachen valley of Sikkim. It is very similar in foliage to a fine rhododendron. Wight gives Griffithiana and G. Neigherennis.—Hooker.

GOUL, amongst the Persians, a fabulous spirit, sometimes represented as in the form of a beautiful young woman, that resort to churches. They affirm that it entices the traveller by its cries, and then tears him to pieces with its claws.—Dc Bode’s Tr. p. 23. See Ghoul.

GOUR or Gaur, called also Lakhnauti, the ancient capital of Bengal, and its territory, supposed to be the Gangha Regio of Ptolemy. It stood on the left bank of the Ganges, on a stony embankment about 25 miles below Rajmahal. It was the capital of Bengal 730 years before Christ, and was repaired and beautified by Akbar, who gave it the name of Jahangard, which name it still bore by a part of the cirque in which it was situated. According to Ferishta’s account, the unworthiness of its air about the middle of the sixteenth century occasioned it to be deserted soon after, and the seat of government was removed to Tondah or Turmah, a few miles higher up the river; then to Rajmahal. Three causes, however, viz.; the removal of the capital, the desertion of its old bed by the Ganges, and the unworthiness of the region, all contributed to turn Gour into a wilderness. No part of the site of ancient Gour is nearer to the present bank of the Ganges than four miles and a half; and some parts of it which were originally washed by that river, are now 12 miles from it. Taking the extent of the ruins of Gour at the most reasonable calculation, it was not less than 15 miles in length (extending along the old bank of the Ganges), and from two to three miles in breadth. The first rulers who have been identified, were the family of Bhupala. Abul Fazl, however, enumerates three dynasties as prior to this family.

The first of the Vaidya rajas was Suk Sen, in A.D. 1063. Its last Hindu king was Lakshmanan. He had been placed on the throne in infancy, and during his long reign had been a just and liberal ruler. In A.D. 1203 Bengal was overrun by Bakhtiar, a general of Muhammad Gori, and the last Hindu king escaped to Orissa. Gour is also by many supposed to have been founded by one of the physician dynasty of Bengal, not long before the Mahommedan invasion, though Dow and Rennell state that it was the capital of Bengal, not 730 years before Christ.—Tr. of Hind. i. p. 94; Rec. Mems. p. 56; Prinsep’s Antiquities.

GOUR or Goura. Sanskrit pandits of old divided the colloquial languages of India into two classes, each containing five dialects, denominated respectively the five Goura and the five Dravida. By the term Goura or Guda is meant the Blasha or Prakrit or spoken tongues in Northern India,
some old ones of which have long ceased to be spoken, or have merged into others. At present the languages which may be considered Gaur are Bengali, Hindi with its neighbour the Hindustani, Panjabi, Gujerati, Marathi, and the languages of Kashmir and Nepal, altogether nine. The pandits named the five Dravidia or Dravira, viz. Telings, Kanniakata, Marathi, Gurjara, and Dravira or Tamil proper; but at present Dr. Caldwell displaces the Gurjara or Gujerati and the Marathi, and considers the Dravidian proper or Tamil, the Telings, and Canarese, to be the three principal languages of the Dravidian family; and he adds thereto the Malayalam, the Tulu, and the five other languages. Gaur, and Ku, altogether nine Dravidian or Tamil tongues. The Gaur alphabet is the immediate parent of the modern Bengali, and it is to be seen in the ancient inscriptions at Buddha Gaya in the Naga Arjuna cave, also in an inscription from Bhavaneswar in Orissa, and in one from Brahmeswar in Cuttack.

Dr. Caldwell's Comparative Grammar.

GOUR, a race on the cast of the Gond, who extend into the borders of the Chutia Nagpur agency in Udaipur and Sirguja. They are the dominant tribe in Sirguja; and the Sirguja raja is supposed to be a Gour, through claiming to be a Rajput. They are much Hinduized.—Sir George Campbell, p. 32.

GOURAHUR, an obscure tribe of Rajputs in Sarswain, Gungeri, Puchnurah, Budoara, and Bibram, on the borders of Budan and Alighur.

GOURAMI, the Ophiocephalus olfax, a freshwater fish of Cochin-China and China, which has been introduced into Penang, Malacca, Bengal, Neighhurries, Mauritius, Bourbon, Cape of Good Hope, Australia, and Cayenne. Like all the Labyrinthide, it is provided with an apparatus for retaining water, so that when out of the water it can keep its gills moist, and can run to some distance by means of its fins and tail, and even leap upon the near plants to catch insects; grows to 20 lbs. in weight. It is esteemed of more delicate flavour than the salmon or turbot.

GOURD. ENG. Karat, ARAB. Gourd is a term, like that of melon and pumpkin, applied as a suffix to the fruits of species of the natural order Cucurbitaceae or gourd tribe, and of the genera Cucurbita, Cucumen, and Lageneria. The Cucurbitaceae is a group of prostrate or climbing plants, with palmately-lobed leaves and tendrils, chiefly tropical, with but few species extending into cool regions. Many of the species are ariet and purgative.

Cucumis melo is the melon.

Benincasa cerifera, pumpkin or white gourd.

Lagenaria vulgaris, bottle gourd or white pumpkin.

Tricosanthes anguina is the snake gourd.

Cucumis sativa, the cucumber.

Cucurbita maxima, squash gourd or red gourd.

Cucurbita lanifera, the range gourd.

Cucurbita ovifera, vegetable marrow.

The wild gourd of 2 Kings iv. 39 is the bitter cucumber, Citrullus colocynthis.

Towel gourds (Luffa or Cynmpia, D. C.) are grown in the West Indies and West Africa. The close vascular network of the inside of this gourd serves as scrubbing brush and sponge.

GOURKANI, the name of the tribe to which Timur belonged, also Baber and his descendants.

—Ferrier, Hist. of Afghanis, p. 71.

GOUR-KAYET, one of the twelve subdivisions of the Kayaasth race; they are chiefly to be found in Bengal.—Elliot, Supp. Gloss.

GOURROO, also Gourna, an inferior class of Rajputs in Behur and Nugeena of Bijnore, Irradatar of Agra, and Suhar, Shergar, and Huzur Talsil of Murtha.—Elliot, Supp. Gloss.

GOVARDHAN, a mountain which the Yadu race worshipped. It is celebrated in Indian poetry, and is still a great place of Hindu pilgrimage. Nothing less than that it is the personification of Krishna has been the opinion of which Government has been held by his followers. Devout votaries perform the circuit of the mount, by going round its base, prostrating themselves at each step on the way, and marking the space covered by their bodies. This penance can be completed only in several years, and one devotee has been heard of who had been able to go round but half the mountain in seven years. No Hindu dares to bring home any stone from Govardhan; it is said to be endued with life. The Luka-Laki, or hide-and-seek tank, near Govardhan, speaks of the early age of that game among the Hindus, having been played by Krishna with the Gopis. Govardhan mountain is famed to have been reared by Krishna, who

"With one finger reared the vast Govardhan."

—Sir W. Jones' Hymns to Indra, xii. p. 274. Tr. of Hind.

GOVERNOR, the official designation in British India of the President in the Council of the Government at Calcutta, of the Governors of Bengal, of Ceylon, and of the Straits Settlements, all of whom rule with a council for administration and legislation. The rulers of Bengal and the Punjab are Lieutenant-Governors. Governor-General is the official designation of the chief ruler of British India. These have been in succession—Warren Hastings, Sir John Macpherson, Earl Cornwallis, Sir John Shore, Sir Alured Clarke, Marquis of Wellesley, Marquis Cornwallis, Sir George Barlow, the Earl of Minto, Marquis of Hastings, Mr. John Adams, the Earl of Amherst, Mr. Butterworth Bayley, Lord William Bentinck, Sir Charles Metcalfe, the Earl of Auckland, the Earl of Ellenborough, whom the Court of Directors recalled, Lord Hardinge, Marquis of Dalhousie, Earl Canning, the Earl of Elgin, Sir Robert Napier, Sir William Denison, Sir John Laurence, the Earl of Mayo, Lord Napier and Ettrick, Lord Northbrook, who resigned, Lord Lytton (1877), who was succeeded by Lord Ripon, and the Marquess of Salisbury. Governor-General have been Viceroy and Governor-General since Earl Canning, 1st Nov. 1858, and have under them 2 Governors, of Madras and Bombay; 3 Lieutenant-Governors, of Bengal, N.W. Provinces or Agra, and the Punjab and its dependencies; 5 Chief Commissioners, Oudh, Central Provinces, Burma, Sind, Hyderabad, Assigned Territories; as also 2 Residents, of Hyderabad and Nepal; 2 Agents to Governor-General, for Rajputana and Indore. Every order is issued in the name of the Governor-General in Council, but Lord Canning rearranged the Council into the form of a cabinet, with himself as president.

The Act for the Better Government of India (1858) enacts that India shall be governed by and in the name of the Queen of England.
through one of her principal Secretaries of State, assisted by a Council of fifteen members. By the Indian Councils Act (1861), the Governor-General's Council, and also the Councils of Madras and Bombay, were augmented by the addition of non-official members, either natives or Europeans, for legislative purposes only; and by another Act passed in the same year, High Courts of Judicature were constituted out of the old Supreme Courts at the presidency towns.

A Governor-General also rules the Portuguese Possessions of India; another Governor-General rules the Dutch East Indies, known as the Netherland Possessions in India; the Spanish East Indies in the Philippines have another Governor-General; and the French Possessions in India have a Governor.—Imp. Guz. iv.

GOVIND, the tenth Guru of the Sikhs from Nanak.

GOVINDA, Gopala, and Gokala are names of Krishna, derived from his pastoral avocation of herdman, from Go, a cow. Gopinath, husband or lord of the Gopi, another name, is derived from his association with the Gopi herdwomen. Mr. Garrett says that Govinda was given by Indra as a name to Krishna after he had raised Gavardhan. It is a frequently recurring name amongst the Hindus. The Gita Govinda are songs of Krishna; also a pastoral drama by Jayadeva, in praise of Krishna. Jayadeva, the bard of the Hindu race, in the opening of the songs of Govinda, says, 'If they would be delighted with the remembrance of Hari, or sensible to the raptures of love, listen to the voice of Jayadeva, whose notes are both sweet and brilliant.' Jayadeva opens the first interview of Krishna and Radha with an animated description of a night in the rainy season, in which Hari or Krishna is represented as a wanderer, and Radha, daughter of the herd chief Nanda, is sent to offer him shelter in their cot. Nanda thus speaks to Radha: 'The firmament is obscured by clouds, the woodlands are black with tamals trees; that youth who roves in the forest will be fearful in the gloom of night; go, my daughter, bring the wanderer to my rustic mansion.' Such was the command of Nanda the herdman, and hence arose the love of Radha and Madhava.

The poet proceeds to apostrophize Hari, which the Hindu bard terms Rupaca, or personal description:—O thou who reclinest on the bosom of Canala, whose ears flame with gems, and whose locks are embellished with sylvan flowers; thou from whom the day-star derived his effulgence, who slowest the venom-breathing Caliya, who beamest like a sun on the tribe of Yadu, that flourished like a lotus; thou who sittest on the plumes of Garuda, who sippest nectar from the radiant lips of Pedma, as the fluttering chacora drinks the moonbeams. Be victorious, O Hari.—Malcolm's Central India.

GOVINDGHUR, a huge fortress built in 1809 by Ranjit Singh, at Amritsar. It is garrisoned by British artillery and infantry.

GOWARI, a tribe of agriculturists speaking the Mahrati language, dwelling in the more civilised parts of the Central Provinces. They resemble the Raj Gond, but are fairer.

GOWDAH, Gowdian, or Gounden, also written Gonda, Gour, the title of all respectable farmers and the headmen of villages in the Canarese and Coorg districts.

GOWHATTY, a town in Kamrup, 335 miles from Calcutta; it is on the left bank of the Brahmaputra river, in lat. 26°11' N., and long. 91° 48' E., and is 180 feet above the sea-level. Pop. 11,492.

GOWLA. Guj., Hind., Tam. A brown-coloured seed, about the size of, and having much the same appearance as, the coriander seed, but more oval. They have a pleasant, sub-aromatic, and mucilaginous taste, and are considered by native practitioners as cordial and stomachic. They are cultivated in Egypt, from the Persian Gulf, and are distinguished in the bazaars either with or without husks.—Faullier.

GOYOSOO. Jap. A custom-house or townhall, where all foreigners transact business and see Japanese officials.

GRACILLARIA COFFEIIOLIELLA. The larva of this mines the coffee leaves; it is very common, but of no importance to the planter.—Pl. Nieuw.

A small and delicate fucus, well known for the amylaceous properties it possesses, and the large proportion of true starch it furnishes. The fronds are filiform, the filaments much branched, and of a light purple color. It grows abundantly in the large lake or backwater which extends between Putlam and Calpentyn, Ceylon. It is collected by the natives principally during the south-west monsoon, when it becomes separated by the agitation of the water. The moss is spread on mats, and dried in the sun for two or three days. It is then washed several times in fresh water, and again exposed to the sun, which bleaches it; after which it is collected in heaps for exportation. 100 grains weight yielded the following proportions:—Vegetable jelly, 54°50; true starch, 16°00; ligneous fibre, 18°00; sulphate and muriate of soda, 6°50; gum, 4°00; sulphate and phosphate of lime, 1°00; with a trace of wax and iron. For a decoction of Ceylon moss, take Ceylon moss ground to fine powder two drachmas, water one quart; boil for twenty minutes, strain through muslin. By increasing the proportion of the ground moss to half an ounce, the filtered solution on cooling becomes a firm jelly, which, when flavoured by cinnamon or lemon-peel, sugar, and a little wine, is an excellent article of light food for sick children and convalescents. The whole thallus of this one of the algae is sometimes imported from Ceylon and the East Indies, and used in Britain for dressing silk goods. The agar-agar is a sea-weed exported from the islands of the Indian Archipelago as a portion of the cargo of every junk. It form a gelatinous mass with water, to which the Chinese add sugar, and use it as a sweetmeat.—Beng. Phar. p. 276.

GRACILLARIA TENAX.

Gracillaria tenax, one of the algae of the order
GRALLUS.

Rhodomyienae. Mr. Williams and the Hon. Mr. Morrison say that the Chinese people collect this sea-weed on the coast to a great extent, using it for food, and also in the arts, affording an excellent material for glues and varnishes. It is boiled, and the transparent glue obtained is brushed upon a porous kind of paper called sha-chi, which it renders nearly transparent. It is also used as a size for stiffening silks and gauze, and extensively employed in the manufacture of lanterns and in the preparation of paper for lattices and windows. This and other kinds of fuic are boiled down to a jelly by the islanders on the south, and extensively used for food. About 27,000 lbs. are annually imported into Canton from the provinces of Foh-kien and Chekiang, and sold for 6d. to 8d. the pound. The Chinese make it the basis of an excellent glue and varnish, and employ it chiefly in the manufacture of lanterns, to strengthen or varnish the paper, and sometimes to thicken or give a gloss to silks or gauze. Mr. Neill thinks that the gummy substance called chin-chou or hai-tsee in China and Japan may be composed of this substance. Windows made of slips of bamboos and crossed diagonally, have frequently their interstices wholly filled with the transparent hai-tsee glue.—Mr. Neill; Williams, Middle Kingdom, p. 275; Morrison's Comp. Sum.

GRALLUS, a genus of birds of the order Natatorae, tribe Plectores, and family Graulidæ or cormorants, which comprise the Gr. carbo, Gr. Javanicus, Gr. Sinensis, the large, little, and lesser cormorants. Gr. Sinensis, Show, the leu-tze or fishing-bird of China (Phalacrocorax Sinensis) is bred and instructed in the art and practice of supplying his owner with fish. Around the gunnel of their light boats their cormorants perch. On each boat or raft are ten or a dozen birds, which at a signal from the owner plunge into the water; and it is astonishing to see the enormous size of fish with which they return grappled between their bills. They are so well trained, that it does not require either ring or cord about their throats to prevent them from swallowing any portion of their prey, except what the master was pleased to return to them for encouragement and food. The boat used is of a remarkably light make, and is carried to the lake, together with the fishing-birds, by the men who are there to be supported by it.—Jordon; Fortune.

GRAHA. Sansk. A planet; a moveable point in the heavens. In Hindu astronomy the planets have each a great number of names or epithets. The following number are known to every Indian, because they serve to give names to the seven days of the week:—Ravi, or Surya, the sun; Chandra, or Soma, the moon; Mangal, or Cuja, Mars; Budha, Mercury; Guru, or Vichnappati, Jupiter; Sura, or Bhrig, Venus; Sani, or Saturn. Besides these, the Hindu astronomers consider Rahu, the moon's ascending, and Ketu, her descending nodes, as obscure planets, which occasion the eclipses of the sun and moon. Graha, when the terms Madhya and Sphuta are prefixed to it, signifies the mean and apparent place of the planet in the Hindu sidereal or fixed zodiac. Graha laghavā is the name of a treatise on astronomy, written about the 4657th year of the Caiiy (A.D. 1555). The Graha, or planets of the Hindus, are sometimes worshipped together, and at others separately. Graha Parivritthi is an account of time used by the inhabitants of the southern provinces of the Peninsula of India. It consists of a cycle of 90 solar sidereal years of 356½ days. Its epoch is A.D. 24, and it is constructed of the sum of the products of the revolutions of Mars (15), Mercury (22), Jupiter (11), Venus (5), Saturn (9), and sun (1).—Cole. Myth. Hind. p. 38; Warren, Kala Saudita.

GRAHAM, JOHN, a servant of the Bombay Government, author of a catalogue of the plants growing in Bombay and its vicinity, 1830, in which he was assisted by Mr. Joseph Nimm of Bombay. Mr. Graham was a native of Dumfries-shire, and arrived in India in 1828. He died at Khandalla on the 28th May 1839, at the age of 31. The catalogue has unfortunately been of little use, owing to the absence of descriptions rendering it impossible to identify in a satisfactory manner the species referred to.—Hooker f. et Th.

GRAHILOTE or Gehlote, a Rajput tribe of the Suryavansi, the chief of which is the Maharana of Mewar. By universal consent, as well as by the gotra of this race, its princes are admitted to be the direct descendants of Rama, of the Solar line. A pedigree is deduced from him, and connected with Sumitra, the last prince mentioned in the genealogy of the Puranas.—Todd's Rajasthan.

GRAINS OF PARADISE, Shu-sha-jiu and Si-sha-tau, Chin., are small fruits produced by species of Amomum, Amomum grandi paradise, Linna, and A. grandiflorum. They are hot, acrid, and aromatic, and used for medicinal and other purposes as stomachic and cordial stimulants. Those of the Amomum xanthioides, the Elettaria cardamomum are also known by the same Chinese names.—Smith.

GRALLATORAE, the Graleæ of Linnaeus, the wader order of birds, which some naturalists arrange as under:

a. The young when hatched able to run at once.
1. Tribe Struthiones, comprising the ostriches, emus.
2. Tribe Prostrinæ, bustards, plovers, cranes.
3. Tribe Longirostræ, snipes and sandpipers.
4. Tribe Littoroæ, rails and water-hens.

b. With the young helpless when hatched.
5. Tribe Cistirostræ, storks, herons, and ibises.

Many of these are migratory, and come annually into India across the Himalaya. Mr. Hodgson says the grallatorial and natatorial birds begin to arrive in Nepal from the north towards the close of August, and continue arriving till the middle of September. The first to appear are the common snipe, the jack snipe, and Rynchelea; next, the scolopacous waders (except the woodcock); next, the great birds of the heron and stork and crane families; then the Natatoræ; and lastly the woodcocks, which do not reach Nepal till November. The time of the reap-pearance of these birds from the south is the beginning of March, and they go on arriving till the middle of May. The first which thus return to Nepal are the snipes; then come the teal and duck, then the large Natatoræ, and lastly the great cranes and storks. The Grallatoreæ which visit Nepal or pass over it are much more numerous than the Natatoræ. The wild swan was once seen in Nepal in the mid-winter of 1828.

None of the Natatoræ stay in Nepal beyond a week or two in autumn (when the rice-fields tempt them), or beyond a few days in spring, except

1243
the teak, the widgeon, and the coot, which remain for the whole season upon some few tanks whose sanctity precludes all molestation of them. There are cormorants throughout the season upon the larger rivers within the mountains, but none ever half in the valley beyond a day or two. For so long, however, both they and pelicans may be seen occasionally on the banks.

The larus and sterna are birds which usually affect the high seas; but Mr. Hodgson had killed both the red-legged gull and a genuine pelagic tern in the valley of Nepal. But so had he fishing eagles; and in truth, he adds, who shall limit the wanderings of these beautiful birds of the ethereal expanse? See Birds; Migration.

GRAM, a word supposed to be derived from the Portuguese Grao, grain, but applied by Europeans in India to the pulses from species of Cicer, Dolichos, and Phaseolus.

_Cicer arietinum_ furnishes that called Bengal grain, and is the Chenna or Chuna of Bengal.

_Madras gram_, generally known as Kulti, is the Dolichos uniflorus, _Lam._, the _D. biflorus_, _Roscb._. It has a pale yellow and a jet black variety, and is both used for cattle, and by people in curries. It has been tried in England, but unsuccessfully.

_Phaseolus mango, _Linn._, furnishes the green gram of all India; it is the _Ph. max._, _Roscb._. There are several varieties, one of them with black seeds, called black gram. It is a very important crop, and is largely exported. Its chemical composition, a starchy matter, 59.87; nitrogenous, 24.12; moisture, 11.05; fatty or oily matter, 1.22; and mineral constituents, 3.66.

_Mungo_ is the ground nut, the Arachis hypogea, which is eaten as a fruit, and yields an edible oil. Gram exported from India,—

GRAM or Grama. _Sansk._ A village and its lands, modified into the Hindi, Gam, Gaon, Gaum, and in Telugu Gramam. The village lands are held under several tenures in the different parts of India, either one individual being responsible for the revenue, or it is paid by a number of individuals as a coparcenary. In the Tamil portions of the S. of India, the Ekabhogam gramam (sole enjoyment) or Ijaman gramam (Yajaman, householder) is usually the property of a single individual. There are in N. India, Biaya chara or brotherhood villages, called also Pattadari (shore), in the Sanskrit, Pasung rarei and Pangi-vali, or by the Sanskrit terms Samohi or Samudayam. The Pattadari or share tenures in the south are called Arudi-kari, Achanthiram, Bhattachatri or Bhartivarti and Palabhogam.

Grana Deva, _Sansk._, a tutelar deity of the Hindus, who protects the fields, villages, and towns from evil spirits and from all evils. In the extreme south of India, Aynar with his two wives are frequently the Grana Devata, the genii lod. In many parts of India—the Grana Devata are the most popular objects of worship with the mass of people. See Devar.

Gramam, in the Travancore the headman of a village, is also the hereditary chief of the Shanar, a race who cultivate the palmyra for their palm-wine. In Bengal, Uriya, Tel., Karn., and Mal., it denotes the village barber.—_Wilson._

Grana Peraverticum, _Tam._, a village senate or council which ruled the village republics of India prior to the introduction of the present system.

GRAMMAR is a favourite study among all Hindus. It is a tradition that Agastyra wrote the first Tamil grammar, but it perished on account of the curse of his pupil Tolkappiyar. The latter wrote what is called the Tolkappiyam, the oldest treatise on the subject now in existence. It contains 1276 sutras, or rules in verse. Pavananti wrote the Nannul, in 462 sutras, considered the standard work on Tamil grammar. It is greatly admired for its logical arrangement and comprehensive brevity. The Tamils boast that its sutras do not contain a single redundant word. Though intelligible to good scholars, others will think that the remark of Sir William Jones applies to them in some measure. 'dark as the darkest oracles.'

GRAMMATOPHYLLUM, a gigantic epiphytal orchid peculiar to the Archipelago. Its clusters of leaves and flower-stems are ten or twelve feet long.—_Wallace._

GRANADA, a town in Spain. Its Albaebra, or ancient palace of the Moorish kings, in point of workmanship perhaps the most beautiful extant, and justly the pride of Granada, stands on a lofty eminence between the rivers Doura and Xenil, and derives its name from the red colour of the materials with which it is built. The words Al hamra signify the red house, or palace. For—_Alhamra._

GRANADILLA, Passiflora quadrangularis, the Jamaica passion-flower, flourishes well on the Tennessean coast, and is very prolific. The smooth oblong fruit grows nearly as large as a cucumber, and contains a succulent pulp, which makes a cooling, delicious dish, and, when prepared in tarts, can scarcely be distinguished from green apple. The Rev. Mr. Bennett of Tavoy introduced it among the Karens, by whom it is highly esteemed, and much sought for. It possesses all the attractive qualities of fine fruit, handsome fragrant blossoms, and, when trailed over an arbour, a rich, pleasing shade.—_Mason._

GRANARIES or Grain Pits. Kalanjemum, _Tam._, Patra, _Tel._, are underground pits in which grain is stored. Grain pits in India are in elevated dry spots, their size being according to the nature of the soil. All the preparation they undergo is the incineration of certain vegetable substances, and lining the sides and bottom with wheels and barley straw. The grain is then deposited in the pit, covered over with straw, and a terrace of earth about eighteen inches in height, and projecting in front beyond the orifice of the pit, is raised over it. This is secured with a coating of clay and cow-dung, which resists the ordinary rains, but is renewed as the rainfalls injure it. Grain can be kept in these for years without injury.

GRAND LAMA, the chief lama or priest of Buddha, in Tibet, who is supposed to be a Bodhisatwa, who abstains from accepting Buddhahood, and is re-born again and again for the benefit of mankind. See Buddha; Lama; Sakya.

GRAND MOGHUL, a title given in Europe to the last dynasty of Mahomedan rulers in India, who reigned at Delhi. See Moghul.

GRANEEA MADERASPATANA. _Poir._

Gr. Adamsania, _Cas._ Arctemia maderas, _Will._

Nanuti, ... _Beng._ Mashiputri, ... _Tam._

Nalum mats, ... _Malle._ Mustur, ... _Tel._
Grapes, the fruit of the vine, are grown in most parts of British India and in China. There are many species of the genus Vitis, but the V. vinifera is the only one known as the grape vine. V. Indica, the Ameloucha of the Indian Peninsula, Bengal, and Himalaya, produces beautiful clusters of round purple berries, and a large grape which is very fair eating; and the common vine of Europe is probably from this plant. The wild grapes of Isaiah v. 2 are a species of Solanum.

The vine seems to have been known in China from the earliest times, but varieties appear to have been re-introduced from Farghana, Ladakh, and other western countries. The wild V. Amurensis, Ruppins, of the Amur, has been supposed to be identical with the cultivated plant. Quantities of grapes are grown in Peh-chi-li and Shan-si provinces, green grapes in Sze-chuen and Foh-kien, and a very excellent sultana raisin in Tien-tsin.

Grapes dried before being ripe, and powdered, are used in Kahl as a pickle. In the Panjab several varieties of grapes are recognised, — Kan-dahari, a purple grape; Kishmishi, a small seedless grape, producing what are called in England sultana raisins,—these are of the varieties called Sahibi surkh and Sahibi abblak; Khatan grapes produce the large common raisins, called munakka; Fakhri, sometimes called Askari, a black grape; Munakka and Abjosh munakka are grapes dried in the sun; Rish bana; Dida-i-gau, a white grape, with some spots on the skin, which are said to resemble a cow's eye, hence its name; Pious Hindus refuse to eat this grape on that account; Karghani (white), called from the name of a place; Angur Jalalabadi, called also Khatta angur, grown at Charbagh, a few miles from Jalalabad; Charanurg, grown also at Jalalabad. The common sorts of grapes are Roche-i-surkh and Roche-i-safed, also Toran. Green grapes sold in the plains in the winter time, are the Hosaini or Shaikh kalli varieties; they are of large size, pale green colour, and of delicate flavour. They are picked before being quite ripe, and packed between layers of cotton wool, in round boxes, made of white paper, and tied up with a string of goat's hair; these are exported in thousands, and called Angur khatti. There is yet another, the Akta grape, which produces bloom raisins, called Dagh, or more properly Kishmish-i-daghi, which are prepared by dipping the ripe bunches of fruit into a boiling solution of quicklime and potash (hence called Abjosh, lit. infused in water) before drying in the shade.

In the Indian Peninsula there are several varieties, but the common lock-green is the most esteemed, though many persons like the Habshi grape. In the arid regions of Rajputana, where they depend entirely on the heavens for water, and where they calculate on a famine every seventh year, nothing that can administer to the wants of man is lost. The seeds of the wild grapes, as the bhzoek, buroo, herraroo, sewun, are collected, and, mixed with bajra flour, enter much into the food of the poorer classes. They also store up great quantities of the wild ber, khyr, and kharil berries; and the long pods of the karjna, astrigent and bitter as they are, are dried and formed into a flour.

Grape sugar, also called Glucose, is found in the fruits of most plants. It seems to act on the system in precisely the same way as cane-sugar. The result of the fermentation of grape-sugar is the production of alcohol, which does not differ much in composition from sugar.

Graphic Slate, that 'soils and writers,' is found east of Tavoy, and another and softer variety is found in Monmluen.—Mason.

Graphite, also called Black Lead and Plumbago, occurs in Travancore, Ceylon, Vishnagranam, at Gurjoli, and at Almorah. It occurs in Travancore, and also in the corresponding parallels on the eastern sides of the ghats in Tinnevelly, in both sites the rocks apparently coinciding in direction with the strata in Ceylon, in which this mineral occurs. Graphite is found in the districts of Simla. In Upper Burma it is found in large quantities to the east of Nat Talk, on a low range of hills near the village of Nyoke toke.

Grapus, a genus of the Crataeaceae.

Grapus strigosus, Edras, Red Sea, Indian Ocean, New Holland.

G. variegatus, Edras, New Holland, Chili.

G. mesapotam, Edras, Red Sea, Indian Ocean.

G. pleiatus, Edras, Sandwich Islands.

GRAPTOPHYLLUM HORTENSE. Nees. Justicia picta, Roxb.

A handsome flowering plant with large crimson flowers, native of Java, commonly cultivated in gardens in India. Var. b. G. lurido-sanguineum, the Sa-lat-ne of the Burmese, is larger.

Some varieties have red and dark red spots. The leaves are used for the decoration of the dessert after dinner, and other ornamental purposes. Few leaves can be found on which some grotesque resemblance to the human countenance may not be fancied or traced.—Riddell; Joffrey; Voya, 488.

GRAS, the griffin of Rajputana. The Naguni is half serpent, half woman. At Baroli the Gras and Naguni are represented in a highly finished sculpture.—Toft's Rajasstan, ii. p. 716.

GRAASIA. HIND. Garaso, Git. In Malwa, Gujerat, Cutch, and Rajputana, a chief of a tribe claiming revenues from villages. In Mewar, the Grasia is of mixed Bhil and Rajput descent, paying tribute to the Rana of Udaipur. In Western India, a military chief. The term is derived from Grass, a Sanskrit word which signifies a mouthful, and has been metaphorically applied to designate the small share of the produce of a country which these landowners claim.—Malcolm's Central India.

GRASS.
In England the grasses have received great and deserved attention. In some places hay grasses are cultivated; in some, those adopted for pasture or for catch-meadows; while in other localities preference is given to varieties which yield early or late pasture, or have the recommendation of being suitable to some peculiarity of the soil. In India, however, the subject has received no such minute consideration, although deserving accurate investigation and careful experiment. The pasture lands are everywhere left to nature. There is generally a right of common pasture, and there is nothing to prevent the village cattle from roaming at discretion.

The populations of Central and Southern Asia are largely pastoral and agricultural, and the grasses useful for cattle are therefore of vital importance. Nomads shift with the seasons of the year to their summer and winter grazing grounds; and in India, partly in this manner, and in part trusting to their natural grasses, they are still able to rear large herds and flocks, though the waste lands of India are yearly becoming more tilled to meet the wants of the increasing populations. Grass is but seldom cut and stacked as hay. The rapid growth and subsequent dryness render many natural Indian grasses unfit for pasture at the end of the year; and grass-cutters, who provide horses, usually search for and collect the dub grass, the Cynodon dactylon.

Sir W. Jones observes (As. Res. iv. p. 242) that it is the sweetest and most nutritious pasture for cattle, and its usefulness, added to its beauty, induced the Hindus, in their earliest ages, to believe that it was the mansion of a benevolent nymph. Even the Veda celebrates it, as in the following text of the A’tharvana: ‘May Durva, which rose from the water of life, which has a hundred roots and a hundred stems, efface a hundred of my sins, and prolong my existence on earth a hundred years.’

In the east coast of the Peninsula of India, the vegetation of most plants is interrupted for a longer period by the dry season, than in Europe by the winter. The sandy tracts about Madras remain perfectly arid, only a little relieved by partial showers during the south-west monsoon. This alternation of drought and heat at one season, and of heavy rains at another, necessarily precludes the pasture grounds of the Karnatic from attaining the verdant, flourishing condition observable in extra-tropical countries. At the same time, however, the temperature of the cold weather admits of the production of a considerable quantity of serviceable grass.

No grasses are cultivated in China for food for animals. The country produces many species fitted for rearing flocks and herds, and are extensively cultivated in the south of China for weaving floor matting of various degrees of fineness, the coarser kinds of which are used also to construct sheds to screen workmen when building houses, and even the walls of the huts tenanted by the poor; the best comes from Lien-tan, west of Canton.

Of the grasses eaten by cattle, Sir A. Burnes mentions that three are cultivated in Kâbul,—Riskha or Medicago sativa, the common lucerne; Shafful, a kind of trefoil; and the Si-barga (three leaves), a clover new to Europe, which from its great yield was named Trifolium giganteum.

Another plant, the Melilotus leucanthus, of Bokhara clover, differs much from the Trifolium giganteum in its properties, though, like it, of luxuriant growth.

In the Râkh of the Panjab, and in the ‘bar’ tracts during the rains, the whole surface of the plain is covered with grass. Thirty sorts—each with its distinctive name—were collected in the rainy season near Lahore.

Dr. Royce mentions that the grasses of Hurriana (Siris and Rohk)—and it is true of the râkh generally—consist of species of Panicum, Pennisetum, Cenchrus, Chetania, Daicytotonem, Chloris, Eleusine, Accrahe, Poa, Eragrostis, and Andropogon, and to these, species of Saccharum and Rotbollia should be added. In one place a clover or lucerne, Shaftul, is grown, also Sinji, but this principally by Europeans for their horses and other cattle. Cattle in India are usually fed (besides grass) on Bhusa, or, as it is called in Panjab, Turi, the chopped straws of wheat and barley; besides which they get Karbi, the dried stalks of Jowar (Sorghum vulgare); this latter when green and fresh is called Charr. Chopped leaves of the Ber (both Z. vulgaris and Z. nummularia), called Mula, are much used, and are said to be fattening. Dr. Henderson mentions that in Shâhpur, and one or two other districts, turnips are grown very extensively for feeding cattle during the cold weather, and they often attain a larger size than in Europe. A few of these are used in times of famine for food, as the Markan grass, the wild Sawank, and Phog. The seed of Calligonium polygonum is used as human food in the Panjab in times of famine. Dhaman or Anjan (Pennisetum cenchroides) is considered the best grass for cattle, rapidly improving their condition, and increasing their produce in milk. Jhang is a scented grass, probably Andropogon schenanthus; and the root of A. muricatum forms the khaskhas used in matting tatties and sareaus for cooling purposes.

The Durva or Hurrrial grass (Cynodon dactylon), unquestionably the best species which India possesses for forage, has been cultivated with great success at Vellore by Major Octley, who has given an interesting account of this grass in the Madras Journal of Science and Education, xv. p. 477. In upland districts rye-grass and clover grow; and both these exotic, when sown fresh, have been found to answer exceedingly well on the Shevaroy, Pulney, Neigherry, and Baba Booden Hills. The Guinea grass has been strongly recommended in Bengal.

Inoculating Grass.—In poor soils such as that of the Karnatic, grass seeds do not take so well as in rich land, and there is great difficulty in procuring a good sward. In this case recourse must be had to planting, or, as some call it, inoculating grass. This is done by taking pieces of turf from the banks of a river or tank, and spreading them over the land to be laid down, after it has been prepared in the same manner as it would have been to receive the seed. The turf should be taken up in little square pieces, and spread over the surface of the ground, leaving small interspaces between each piece. A stone roller or a wooden beater should then be employed to press them into the ground. In a few days the interspaces will be filled up, and a complete carpet of turf to have formed.
GRASS-CLOTH.

Before putting down the turf, poor stiff lands must be divided by ditches, ploughed in deep furrows, and exposed as much as possible to the wind and sun. Such soils may with careful culture and irrigation become permanent meadow land, but it is essential to get them into a sound state by most carefully clearing them of rush grass and weeds before laying down grass seeds, and subsequently by keeping the land free of coarse grass by hand weeding. Paring and burning the straws have been found useful, and if beneficial in the first instance, the operation may be repeated with advantage.

Lepidzia stricta, H. and A., the Japan clover of China and Japan, is much valued in N. America as a grass for cattle.—Von Mueller; Powell; Royle, Ill.; Mason; Williams; Hooker’s Ill. Jour.

GRASS-CLOTH, the Hia-pu or Chna-ma of the Chinese, is fabricated from the fibre of the Urtica nivea of Linum, the Boehmeria nivea of Gaudichaud. It is met with bleached and unbliached. It is extensively used by the Chinese, being woven into narrow pieces and into handkerchiefs, the export being chiefly to India and the United States, many handkerchiefs being sent to the latter country. Clothes are sent from the Chinese market to South America, made from grass-cloth and nankeen. No account of the quantity has been kept. Coarser sorts of China grass-cloth are furnished by the fibres of Sida tiliafolia and Dolichos bulbosus.—Smith.

GRASSHOPPER.

One of this tribe, a species of Detusics, is kept by the Chinese in cages for fighting. The Greeks ate grasshoppers, and liked them amusingly; the aborigines of New South Wales eat them raw, first taking off their wings.

GRASS OILS are obtained from species of Andropogon.—A. citratum, A. Martini, A. iaranae, and their allies. They are fragrant essential oils. In the south of the Peninsula of India, in Madura, are three grasses or sorts of grass, named Poopathal, Secompil, and Komatchpil, which are employed to furnish grass oils. The stalks are cut into pieces a span in length, and put into earthen pans with water, and exposed to the action of fire. In the south of India and Ceylon they are known to the British as the lemon grass oils, also citronelle oils, ginger grass oil, essence of verbena.

The grass oil of Nemaun, Roosa-ka-tel, Hind., was first brought to notice by Dr. Maxwell in 1829, and was further described by Dr. Forsay in 1842. This oil is obtained from the Andropogon Martini by distillation. 250 to 300 small bundles of the grass are placed in a boiler, covered with water, and distilled. About a seer of oil is obtained in the receiver. It is volatile, extremely pungent, of a light straw colour, very transparent, with a peculiar rich and agreeable odour. As a rubefacient, it is very highly esteemed by the wealthy natives of India for the cure of rheumatism, especially that of the chronic kind. Two dracons of the diluted oil are rubbed over the pained part in the heat of the sun, or before a fire, twice daily. It causes a strong sensation of heat or prickling, lasting for two hours or longer. The natives also regard it as an efficacious remedy in slight colds. They anoint the soles of the feet with the oil, and it is stated that slight diaphoresis is thus produced. It is also known as the ginger grass oil. It is employed as a substitute for caoutch oil. The grass has a strong aromatic taste, scenting the milk of those animals which feed on it. The oil is very fragrant and aromatic, and the colour is a pale straw. Much used in perfumery, and medicinally as a stimulant and diaphoretic. It has the power in a most remarkable degree of preventing the hair of the head from falling off after acute diseases, such as fever, or after confinement or prolonged nursing. It even restores it after it has fallen off, but it must be strong and pure.—Royle, Useful Plants; Trans. Med. and Phys. Soc. iii. p. 219; O’She.

GRASS TREE, or Australian Grass Tree or ‘Black Boy’ (Xanthorrhoea, sp.). Some of the grass trees are from 5 to 7 feet high, and as many in circumference. They have leaves 3 to 4 feet long, and flower-spikes 5 to 10 feet high, thickly clothed with hard scales and small white star-like flowers, except for about 14 feet at the base, which is bare. Abundance of red resin is exuded by them.—J. Backhouse.

GRASS-WRACK, Zostera marina, L., belongs to the small group of grass-like marine plants. It is common on the British coast, and in most parts of the world, near low-water mark. Used for packing and to stuff beds.

GRATIOLA SERRATA, Irvine.

GRACIALUS, a genus of cuckoo-shrikes, of the family Laniidae and sub-family Campephaginac.

GRAVET, a term in Ceylon applied to the space outside the principal forts in the island. The Singhalese word Cadavetta describes the enclosure or boundary of a temple or city, or a royal chase. It was adopted by the Portuguese, after the erection of these fortresses, to define the limits of the lands they had been permitted by the native princes to appropriate, and the word Garvetta is still used in the patois of the Portuguese descendants. When the Dutch seized the forts, the word passed into Gravette, which appears on their records; and from the British, in turn, took the present term Gravet.—Tennent’s Christianity in Ceylon, p. 291.

GHAY, J. E., author of Illustrations of Indian Zoology, chiefly from the collection of Major-General Hardwicke, Lond. 1830.

GREASE FOR RAILWAYS. The mixture used by the East Indian Railways for axle-grease is—tallow, 50 lbs.; country soap, 20 lbs.; castor-oil, 30 lbs.; water, about 10 gallons. Melt the tallow in a large vessel, cut the soap in slices and put into the water when the latter is warm. When the soap is fully dissolved, pour the water containing it into the tallow, after which add the castor-oil; immediately after the latter is added, take the mixture off the fire, and while it is cooling let it be stirred constantly till cool. The mixture may require a little more or less water, according to the temperature of the weather.

GREAT MOGHUL, a designation employed by the nations of Europe as the title of last dynasty emperors of Delhi, most of whom were descendants of Baber.

GREAT WALL OF CHINA was built by the
GREECE.

emperor Chi-hoang, of the Tsin dynasty, about B.C. 260. It was done by forced labour,—every third labouring man was compelled to work for his bare food as a remuneration. It extends from the sea to the most westerly province of Shen-si, about 1500 miles. It was built of earth faced with brick. From the west shore of the Gulf of Liau-tung, in lat. 39° 58' N., long. 119° 51' E., originating within 100 yards of the beach, and having a massy pier jutting out into the sea, it crosses mountains, valleys, and rivers, and was finished in five years. Its breadth admits of six horses riding abreast, and thus with every hundred yards towards Chi-hoang-ti who introduced yellow as the colour of the royal family. The route between Pekin and Western Asia and Europe issues from the western end of the Great Wall, to cross the desert of Gobi.

GREECE, a celebrated country in Europe, famed for the military exploits, learning, and arts of its inhabitants. The people of Greece call their country Ionia. It is the Yuuan of the Mahomedans, whose people the Hindoostan style Yavana. It has produced many men famed throughout the world,—Alexander the Great, his teacher Aristotle, Socrates, Hippocrates, Plato, who are not mentioned by Hindus, although known to all the Mahomedans of Asia, as Sikander, Rumi, Aristok, Skratuk, and Aflatan. The following Greek and Roman writers were known to the Mahomedans, viz.:

Herodotus, b.c. 450 Clemenb Alexand-
Ctesias, b.c. 400 Eusebius, 320
Oroondas, 420
Megalasteennes, 370 Festus Avienus, 380
Strabo, a.d. 20 Marcian, 420
Pomponius Mela, 20 Cosmas Indicopleus-
Pliny, 27 Stephen of Byzantium, 560
Persilus Mari Ery-
trh, 525 Ravenntot Fonymi-
Dionysius Periegetes, 80 Cosmographia, 7th cent.
Ptolemy, 130 Georgius Synecleus, 800
Arrian, 150 Eustaliuia, 12th cent.

But the first Greek historian who speaks clearly of India is Hekataios of Miletus (549-486 B.C.); the knowledge of Herodotus (450 B.C.) ended at the Indus; and Ctesias, the physician (401 B.C.) brought back from his residence in Persia only a few facts about the products of India,—its dyestuffs and fabrics, monks and parrots. India to the east of the Indus was first made known to Europe by the historians and men of science who accompanied Alexander the Great in 327 B.C. Their narratives, although now lost, are condensed in Strabo, Pliny, and Arrian. Soon afterwards, Megalasteennes, as Greek ambassador resident at a court in the centre of Bengal (306-298 B.C.), had opportunities for the closest observation. The knowledge of the Greeks and Romans concerning India practically dates from his researches, 300 B.C. Alexander the Great had entered India early in 327 B.C. He crossed the Indus above Attok, and advanced without a struggle over the intervening territory of the Taxiles to the Jhelum (Hydaspes). Having drawn up his troops at a bend of the Jhelum, about 14 miles west of Chillianwalle, the Greek general crossed under shelter of a tempestuous night. The enemy had 30,000 efficient infantry, 4000 horse, 300 chariots, 200 elephants; and Alexander's army numbered about 50,000, including 5000 Indian auxiliaries under Mophis of Taxila. Alexander found the Rawal Pindi district in possession of the Takka or Takshak, a Scythis race; and, 1300 years afterwards, Malmud found it in the possession of the Ghakkar, who are still there. It was from the Takshak that the Greek name of Taxiles was derived. Alexander advanced south-east through the kingdom of the younger Porus to Amritsar, and, after a sharp bend backward to the west to fight the Cacthei at Sangala, he reached the Beas (Hyphasis). The country was hostile, and the Greeks held only the land on which they encamped. At Multan, then as now the capital of the Southern Punjab, he had to fight a pitched battle with the Mallus, and was severely wounded in taking the town. His surgeon dressed his wound, and was kept within it by the sword. Further down near the confluence of the five rivers of the Punjab, he made a long halt, built a town, which he called Alexandria, and which is the modern Uch."
GREECE.

finding himself cut off from Syria by the Persian revolution, declared his independence.

Araxes is called Akeche by Eastern writers, and is said to have been a descendant of the ancient Persian kings. When he gained the kingdom, it is said he promised to exact no tribute, and merely to consider himself as the head of a confederacy of princes, united for the double object of maintaining their independence and freeing Persia from a foreign yoke. This is the commencement of that era of Persian history called by Eastern writers Muluk-ut-Tauif, or commonwealth of tribes. In A.D. 906 Phrases was taken by Ismail, founder of the Samani dynasty. It ceased now to be a seat of empire, and in A.D. 967 became the capital of the house of Shemug, a race of petty princes who maintained a kind of independence, while the dynasties of Sanaan and Dilemee divided the empire of Persia. In A.D. 1027 Phrases was the last conquest of Mahmud of Ghazni.

II. Bactria.

The sole evidence of the long line of Bactrian kings exists in the emanations from their mints, exumed from time to time in and around their ancient seats of government. In the almost total absence of annals, whether occidental or oriental, their coins furnish nearly all the testimony at present available with which to reconstruct the story of the survival, re-institution, and extinction, of the dominant Hellenic element on the site of Alexander's furthest conquest in the East, and of those potentates who swayed the dynasties of these lands for upwards of two centuries. Professor Wilson has given a list of these from Thedotus I., B.C. 256, to Pantaleon, B.C. 120. Then of Barbaric kings, Su Heraeus, Kadaphes and Kadphises, from B.C. 100 to B.C. 50. Of an Indo-Parthian dynasty; the Indo-Scythian princes of Kabul; and a classification of their contemporaries. Mr. Thomas, in Prinsep's Antiquities, quotes Major Cunningham's table:

B.C.
256. Diodesotus I., Bactriana (including Sogdiana, Bactria, and Margiana).
247. Agathocheles, Bactria and Paragamisade and Nysa.
250. Phryganeus, Paragamisade and Nysa.
196. Demetrius, do., do., and later in his reign, Patalene, Syrastene, Larice.
190. Helocheles-Bactriana and Paragamisade.
185. Eucrately-Bactriana, Ariana, besides Patalene, Syrastene, and Larice, as well as Nysa, Gandhara, Pekhotaht, and Taxila.
173. Antimachus Nikorhabos-Nysa, Gand., Peuk., and Taxila, contemporarily with Eucratides' reign, but independent of the rest of his dominions.
165. Philoxenes succeeds to Antimachus Nikorhabos' kingdom.
Nicob, do., with the exception of Taxila.
165. Apollodotus succeeds Eucratides in Ariana, as well as Pata, Syr., Larice.
Zolus, follow Apollodotus in Ariana alone.
Dionysus.
159. Lydus succeeds those in Paragamisade, and obtains Nicob's dominion of Nysa, Gand., Peuk.; while Mithridates I. possesses himself of Ariana, having previously gained Margiana from Eucratides.
Antialcides succeeds to Lydus' kingdom.
Amynius. Archebus follows Antialcides.
Greece.

Panjib had first been placed under Philip, while the civil administration of the country remained in the hands of its native princes, Taxiles and Porus. Afterwards, on the murder of Philip by the Macedonian soldiery, Alexander (Anabasis, vi. 2, vii.) directed Eudemos and Taxiles to govern the country until he should send another deputy. It is probable, however, that they continued to retain the charge; for, after Alexander's death in B.C. 329, Eudemos contrived by his general Eumenes to make himself master of the country, by the treacherous assassination of king Porus (Diodorus, xix. 5). Some few years later, in B.C. 317, he marched to the assistance of Eumenes with 3000 infantry and 5000 cavalry, and no less than 120 elephants. With this force he performed good service at the battle of Gabiene. But his continued absence gave the Indians an opportunity not to be neglected, and their liberty was fully asserted by the expulsion of the Greek troops and the slaughter of their chiefs.—Justin, xv. 4.—"Prefactos ejus occidet;" again, 'Molienti deinde bellum adversus prefactos Alexander's. Chandragupta was present when Porus was murdered, and he became the leader of the national movement, which ended in his own elevation to the sovereignty of the Panjib. Justin attributes his success to the assistance of banditti; Justin, xv. 4—"Contractis latronibus Indos ad novitatem regni sociavit." But in this Colonel Cunningham thinks he has been misled by a very natural mistake; for the Aratta, who were the dominant people of the Eastern Panjib, are never mentioned in the Mahabharata without being called robbers (Lassen, Pentapot. Indica), —"Arati prefecto latrones," and "Bahici latrones."

The Sanskrit name is Arashtra, the 'kingless,' which is preserved in the Adrastie of Arrian, who places them on the Ravi. They were the republican defenders of Sangala or Sakala, a fact which points to their Sanskrit name of Arashtra, or 'kingless.' But through their power was then confined to the Eastern Panjib, the people themselves had once spread over the whole country,—'Ubi fluvii illi quin ... ibi sedes sunt Arratorum' (Lassen, Pentapot. Indica, from the Mahabharat). They were known by the several names of Bahika, Jarttika, and Takka, of which the last would appear to have been their true appellation; for their old capital of Taxila or Takka-sila was known to the Greeks of Alexander, and the people themselves still exist in considerable numbers in the Panjib hills. The ancient extent of their power is proved by the present prevalence of their alphabetical characters, which, under the name of Takri or Takni, are now used by all the Hindus of Kashmir and the northern mountains, from Simla and Subathu to Kábul and Bamiyan. On these grounds, it is supposed that the principality of Justin with the Takka, or original inhabitants of the Panjib, and assigns to them the honour of delivering their native land from the thraldom of a foreign yoke. This event occurred most probably about 316 B.C., or shortly after the march of Eudemos to the assistance of Eumenes. It was followed immediately by the conquest of Gangetic India, Justin, xv. 4; and in 316 B.C. the rule of Chandragupta was acknowledged over the whole northern Peninsula, from the Indus to the mouths of the Ganges. According to Colonel Tod, the Yavan or Greek princes, who apparently continued to rule within the Indus after the Christian era, were either the remains of the Bactrian dynasty, or the independent kingdom of Demetrius or Apollodotos, who ruled in the Panjib, having as their capital Sagala, changed by Demetrius, ruled in his Hist. Bact. p. 84, that according to Claudius Ptolemy there was a city within the Hydaspex yet nearer the Indus, called Sagala, also Euthydemia; but he scarcely doubts that Demetrius called it Euthydemia, from his father, after his death and that of Menander. Demetrius was deprived of his patrimony A.D. C. 562. Sagala is conjectured by Colonel Tod to be the Salbanpurra of the Yadu when driven from Zabulistan, and that of the Yuchi or Yeti, who were fixed there from Central Asia in the 5th century, and, if so early as the 2d century, when Ptolemy wrote, may have originated the change to Yuti-media, the 'central Yuti.'

Numerous medals, chiefly found within the probable limits of the Greek kingdom of Sagala, either belong to these princes or the Parthian kings of Minagara on the Indus. The legends are in Greek on one side, and in the Sanskrit character on the reverse. The names of Apollodotos and Menander have been deciphered, and the titles of Great King, Saviour, and other epithets adopted by the Arsacide, are perfectly legible. The devices, however, resemble the Parthian. These Greeks and Parthians must have gradually merged into the Hindu population. Recent travellers—Burnes, Masson, and Ferrier—met with tribes who claim a Grecian descent. According to Burnes, the Mir of Badakashan, the chief of Darwaz in the valley of the Oxus, and the chiefs eastward of Darwaz who occupy the provinces of Kulub, Shaughman, and Wakhan, north of the Oxus, also the hill states of Chirral, Gilgit, and Iskardo, are all held by chiefs who claim a Grecian origin.

According to Ferrier, however, the whole of the princes who claim descent from Alexander are Tajak, who inhabited the country before it was overran by Turki or Tartar tribes. The Tajak, now Mahomedans, regard Alexander as a prophet. The Badakashan family are fair, but present nothing in form or feature resembling the Greek. They are not unlike the modern Persian, and there is a decided contrast between them and the Turk and Uzbek.

According to some writers, the fair complexion and regular features of the Siahposh Kafr, the variously coloured eye and shaded hair, indicate them to belong to the European family of nations, and disconnect them from the Tajak, the Hazara, the Uzbek, or the Kirghiz. It also merits consideration that the region now inhabited by the Siahposh is surrounded by the countries where, this is his dynasty ruled, and is encircled by the colonists, posts, and garrisons which they are known to have established; and by the fact of the establishment of military colonies of Macedonians at Alexandria ad Caucasum, Argieum, and Bazura, and of the garrisons of Nysa, Ora, Massaga, Peukelatis, and Aornis. General Ferrier, on reaching Gazergah, found there a small encampment of persons in the Uzbek dress, but whose configuration of features clearly indicated quite another origin. They stated that they were the descendants of the Yumani (Greeks) whom Alexander the Great (Sikander Rumi) had left in these.
GREECE.

countries; and from the replies he received to the numerous questions he put to these people, he was convinced of the existence of the real descendants of the ancient Greeks in those countries. These Yunnan, he says, are not isolated and dispersed here and there, but united in tribes, occupying a considerable tract of country; nothing, however, either in their language or their habits betrays their origin. They are Mahomedans, and have the reputation of being somewhat fanatical, and are not held in much consideration by the Tartars, amongst whom they are settled; but they are respected, for, like their ancestors, they are brave, and the consequences of their hatred are terrible to those who are the objects of it.

It is said in the Dabistan that Calliatheness sent to his uncle a technical system of logic (naya), which was the basis of the Aristotelian system. We also observe a close affinity between Aristotle's theory of the soul as regards its organism, and the Vedanta-darsana; and Plato's ideas as to the detachment of the soul from the world of sense, constituting the true subjective condition, bear an analogy to the Sankhya philosophy. The Greek kings as well as the Scythians adopted a language closely allied to the Sanskrit. The inscriptions for more than two centuries, during the Greek and Scythian connection, invariably contain the Greek with a vernacular translation. The coins of the Sah kings of Saurashtra have an imperfect Greek and Sanskrit inscription, while those of the Guptas (2d to 4th century A.D.) have an emblem of the Greek and Pali, showing the gradual appearance of the Greek from the Indian coins. The Greeks adopted the Indian symbol of Swastika.

Greece and Asia Minor seem to have been parcelled out among a number of deities, each of whom was the paternal god of some city or race, having not only separate rites, but a form of worship widely different. Each deity had his favourite abode, and local attachment to some valley or grove or town, to which the power and presence of the divinity especially belonged; and hence in Boeotian Thrace we trace the orgies of Bacchus, in Northern Thessaly the worship of Apollo, on the Corinthian shores the rites of Neptune, in Argos the temples of Juno, and in Ephesus the worship of Diana. Though acknowledged to be divine out of their own peculiar domains, yet their worshippers were rather averse to proselytism, fearing lest, by an extended communication, the local influence of the deity should be weakened. The sacred object of Ephesian worship was carefully preserved from the period of its first formation, through the ages which intervened, till the demolition of pagan temples which followed upon the rise of Christianity. The image of Diana consisted of a block of wood of beech or elm, but, according to some, of ebony or vine, shaped into a likeness of the goddess, and evidencing its remote antiquity by the ruggedness of its workmanship. The first statues were unshaped blocks and stones; and hence the word column was generally used by the Greeks to denote a statue. Greeks identified Baal with Zeus, as they did Astarte with Venus. The heaven-fallen idol of Ephesus was not a representation of the elegant huntress of classic fable, but an Egyptian hieroglyphic, a personification of nature. In this character she was pictured as a woman having a number of breasts, to denote, according to Jerome, that, as nature, she was the nurse, the supporter and life, of all living creatures.

The Greek people are now Christians; but until the time of Jesus Christ both Greece and Rome were worshippers of idols, of spirits of deified men, of gods residing in a higher sphere, and of demons in a hell below; and the gods of ancient Greece and Rome have been reckoned at not fewer than thirty thousand. These gods were in their characters simply exaggerated men, with human virtues and vices on an enlarged scale. The common people of Greece continued to believe in these gods until Christianity displaced them; but philosophers early appeared doubting their existence. Xenophanes, b.c. 534, denounced the adoration of the gods as godless fables; but he frankly admitted that he knew not God. About a century later lived the philosopher Thales, followed by Socrates, Plato, the Pyrrhonists, the Academics, the Peripatetics, Epicurus, and the Stoics, all of whom saw the absurdity of the popular creeds, and put forth philosophical views. Milton says of them (Paradise Regained, book iv.):

'The first and wisest of them all professed
To know this only, that he nothing knew;
The next to fabling fell and smooth conceits;
A third sort doubted all things, though plain sense;
Others in virtue placed felicity,
But virtue joined with riches and long life;
In corporal pleasure lie, and careless ease;
The Stoic last, in philosophic pride,
By him called wisdom.
Much of the soul they talk, but all awry,
And in themselves seek wisdom; and to themselves
All glory arrogate,—to God give none.'

In Homer's time the manners were rude and coarse; in subsequent centuries, immorality and vice grew. The Romans copied the Greeks in religion and manners, though Cato the Censor warned his countrymen against Greeks as the parents of every vice. For two centuries before the birth of Christ, immorality and infidelity greatly increased. From the time of Augustus superstition began to reappear, chiefly in the form of wild oriental rites. Human sacrifices were offered as late as the reign of Augustus; slavery was universal; in the public shows gladiators appeared,—sometimes more than 20,000 men perished in these exhibitions in one month. Both Greek and Roman authors complained that the charmers of the people were as grossly corrupt as that of the deities they worshipped.

It was from Chaldæa that the germs of Greek art and of much of the Greek pantheon and mythology originally came. Columnar architecture reached its first and highest development in Babylonia. The lions of Mykenæ are distinctly Assyrian in character; and the Greek Herakles, with his twelve labours, finds his prototype in the hero of the great Chaldæan epic.

Greek mythology is largely mixed up with the mythology of India.

Yama or Dharmaraja is the Grecian Pluto.
Vaitarini of the Hindu pantheon has its supposed analogue in the river Styx.
Corbans has corresponding dogs.
Durga is the analogue of Juno.
Narada, god of music,—Mercury.
Krishna,—Apollo.
Bhawani,—Venus.
Asvini-Durgas,—Prosperine.
Agni,—Vulcan, fire, ignis.
Swaha, wife of Agni,—Vesta.
Aswini-Kumars,—Castor and Pollux.

1251
GREEN COPPERAS.

Greewia.—Aurora.
Ata Deva.—Diana.
Kuvera.—Pluto, god of riches.
Indra.—Jupiter, god of the firmament.
Varuna.—Neptune, god of the water.
Pritivi.—Cybele, goddess of earth.
Vishwakarma.—Vulcan, architect of the gods.
Kartikeya or Skanda.—Mars, god of war.
Kama.—Cupid, Eros, god of love.
Surya or Arka.—Sol, the sun.
Hanuman, the monkey god, son of Pavana.—Pan.
Rama.—the Grecian Dionysus.
Hercules, an Indian deity.—Hercules.
Asinula, an Echus, Genii.
Vayu.—Zeus.
Sri, Lakshmi.—Ceres.
Anna-Purna.—Anna-Perenna.

The Greek Charites must be compared with the Sanskrit Haritas, the coursers of the sun; and both received their name from a root, Ghar, to shine or glisten. Zeus seems to be the Sanskrit Dyaus, and Eryins is Saranyu.

Sceythian coins exhibit Greek and Hindu divinities, and those under the Yu-chi have an image of Siva and the Nandu bull. The affinity between the Greek and Hindu gods and the goddesses, and the languages, literature, and religion, that the process of giving and receiving must have been reciprocal. Varaha Mihira, in his Brihat Sanhita, astronomy, says 'the Greeks indeed are foreigners, but with them this science is in a flourishing state.' We find that the later Greek physicians availed themselves of the Hindu medical works.

The Takshaks and Nagas were the tree and serpent worshippers, whose rites and objects of adoration have impressed themselves deeply on the architecture and sculptures of India. The names were applied in a confused manner to different races of Sceythic origin.—Imai, Gaz.; Tod's Rajastan; Princep's Antiquities by Thomas; Smith's B. W. Dict.; Ed. Ferrier's Journal; General Cunningham, A. C. G. O. I. Calcutta Review, No. 109; Malcolm's Persia; Weber, Hist. Ind. Lit.; Wilson in J. R. A. Soc. xii. 1550; Miller's Seven Churches of Asia; the Rev. J. Murray Mitchell, Letter to Indian Youth; Burns.

GREEN COPPERAS or Green Vitriol.
Sulphate of iron...Eng. Solfate di ferro...It.
Sulphate of fer...Fr. Tarosse...Mal.
Schwefelsaures eisen...Ger. Zunkur madnee...Pers.
Hareassins...Hind. Tootiya-sahh...Twm.
Hera-tutus...Anna baguli...Taw.

A principal ingredient in dyeing, in the manufacture of ink, and of Prussian blue. It is also used in tanning, painting, medicine, etc.—M'C.; Faulkner.

GREEN DYE. In the Comptes Rendus, xxxv. p. 558, there is an account by M. J. Persoz of a green colouring matter from China, of great stability, having the appearance of indigo, which communicates a beautiful and permanent sea-green colour to mortars of alumina and iron, and which is not a preparation of indigo or any derivative of this dyeing principle. It was in thin plates of a blue colour, resembling Japanese indigo, but of a finer grain, differing also from indigo in its composition and chemical properties. On infusing a very small quantity of it in water, this fluid soon acquired a deep blue colour, with a greenish tinge. Upon boiling and immersing a piece of canvas on which the mortars of iron and alumina had been printed, it was dyed a sea-green colour of greater or less intensity according to the strength of the mordant, the portions not coated remaining white. Dr. R. F. Thompson, civil surgeon of Malda, wrote as to a green dye as follows:—'One mound of the dried leaves will dye 1280 yards of cloth of a fine apple-green colour. The supply cheap and unlimited; cultivation easily extended from cuttings or seed; requires little care or watching, as no animal will eat it. The plant is doubly valuable from the seeds yielding a fine clear limpid oil for burning purposes, sample of which I also forward. It takes half an hour to dye a whole than of cloth. An oil obtained from the seeds of the plant yielding the green dye, and expressed in the ordinary bazar fashion in the common kolu, has a beautiful colour, limpid, and burns well. This plant is the Jatropha grandiflora. See Dyces; Rhamnus.'

GREENHEART, Nectandra Rodicci, Schk., a remarkably hard timber of British Guiana, classed among the first eight woods at Lloyd's. It might be introduced into India.

GREENSHANKS of India, of the genus Totauna, family Scolopacidæ. T. glottis and T. stagnatilis are known. T. fusces and T. calidris are the redshanks of India.

GREENSTONE, a volcanic rock common in the Peninsula of India. Some of it is exceedingly hard and difficult to work, but it takes a most beautiful and durable polish, as in the magnificent mausoleums of Goleconda, the tombs of Hyder Ali and Tipu Sultan at Seringapatam, parts of the temples at Bijapur, and in many of the sculptures of the Karnatic pagodas. It is much used for building and ornamental purposes in Madras, for round millstones, pestles and mortars, door-posts, etc. Greenstone dykes of the Peninsula break through the claylate of the eastern ranges of the Ceded Districts, in many places convert it into flinty slate, or turn it to a crystalline or hornblende rock, whilst the dyke acquires a distinctly slaty structure, and so much modified in mineral character as scarcely to be distinguished from the altered claylate of the vicinity.—Carter's Geol.

GREGORY ABUL FARAGIUS, the name by which Europeans designated Mar Gregorius.

GREGVILLEA ROBUSTA, Cunningham, a noble tree, the silk oak of Moreton Bay in Australia; attains the height of 50 to 70 feet, and a circumference of 6 to 8 feet. Its timber has a beautiful grain, and is used for staves of casks.—G. Bennett.

GREWIA, a genus of plants of the natural order Tiliaeae, the linden tribe. In the East Indies the principal species are:

abutilonia, Asieca, calophylla, columnarlis, denticulata, floribunda, polygama, elastica, hirsuta, lavigata, microstemma, microcos, multifora, occidentalis, oppositifolia, paniculata, pilosa, populifera, populinfolia, rotundifolia, salvifolia, sapida, sclerophylla, sepia, sinuata, tricholepis, tiliacifolia, ulmifolia, umbellata, vestita, villosa, viminea.

The bark of G. oppositifolia is employed in the Himalaya for making ropes; and G. elastica, Dhamnu of the natives, is valued for the strength and elasticity of its wood. Cattle are fed on the leaves of some species. The pleasant-tasted subacid fruit of several species is eaten by the natives of India, but principally used for making sherbet. G. affinis, rigida, and salicifolia, Stocks, are trees of Sind, the edible fruits of which are called gangi.
GREWIA ASIATICA.

or gango, which might be improved by cultivation. At Tavoy, when vessels require spars, they are usually furnished from a small tree which grows on the seacoast, belonging to this genus. The Mai-va of the Burmese in Tavoy, and the Tha-ran of the Burmese of Monmlein, are species of Grewia. The wood of a species in the Madras Provinces makes good walking-sticks.—M.E.J.R.; Eng. Cyclopedia; Mason; Voigt; Roxb.; Gaubert.

GREWIA ASIATICA. Linn.

Grows in the Peninsula of India, in Bengal, Northern India, and the Panjab, and is a large tree of Pegu, like G. floribunda, but not so plentiful. It is commonly cultivated in the plains of the Panjab for its pleasant, subacid, small berry-like fruit, eaten and used for making sherbet. A spirit is said to be distilled from it, and the fruit is much prized by Mahomedans, who prescribe it to cool the body in fevers. Cultivated at Ajmir, both large tree and small bush varieties; the large tree is very beautiful when in new foliage. The fruit, containing one or two small stones, is generally made into sherbet by pouring boiling water on it, and when cool adding sugar to the taste. The plants are grown readily from the seed. They are generally cut down almost to the ground in November, and even the leaves are burnt round the stalks, after which the roots are opened and maneuvered, and watered occasionally, when new shoots spring out, and the fruit is borne near the axilla of each leaf; when of a dark purple, they are ripe and fit for use. The appearance of its leaves has caused Europeans to mistake it for the hazel. The leaves and buds are officinal. In the Panjab there are two kinds, one sweet, called Shakarti, and other acid, Sharbatiri. G. Asiatica and G. tiliifolia both yield a useful bast. Wood white colour, and adapted for every purpose of house-building.—Roxb.; M'Clist; Stewart; Ainslie; Irvine; Biddell; Clegg; Rep.; Powell.

GREWIA BETULIFOLIA. Juss.

Gangi, Inare, Tr.-Ind.; Khireha, Tr.-Ind.

A small shrub, growing X.V. from Delhi, on the hills beyond the Indus, and up to 3000 feet on the Salt Range. Its small tasteless fruit is eaten by the natives.—Stewart.

GREWIA FLORIBUNDA. Wall.

A very common tree throughout the Rangoon, Pegu, and Toungoo districts. It is a good serviceable timber for all ordinary purposes of house-building. The bark affords a coarse, strong fibre, not much employed, however, by the Burmeses.—Dr. M'Clist; Cal. Cat. Exz., 1862.

GREWIA HOOKERI. M'Clist. Phet-woon, Bum.

Attains a girth of about 3 to 4 feet, and grows up tall and remarkably straight. It is found with tea in the forests of Pegu and Toungoo. Wood white coloured, and adapted for every purpose of house-building.—M'Clist.

GREWIA MICROCOOS. Linn.

A shrub in the Peninsula of India, and found as a small tree on elevated ground of British Burma. Wood not used. A cubic foot weighs 51 pounds.—Dr. Brindis, Cal. Cat. Exz., 1862.

GREWIA OBLIQUA. Gibson.

A small tree of Canara and Sunda, found mostly below. Wood used in agriculture, house-posts, etc.—Dr. Gibson.

GREWIA OPPOSITIFOLIA. Buch.

Damun, . . . Hind.; Pastu-wanna, Sind.; Paj.; Bihull, Bial, Sind., Paj.;

Grows in the Kheerce pass, in the Dehrah Doon, and in the Sutlej valley between Rampur and Sungnam, at an elevation of 5000 feet. The branches are periodically cut in winter time as provender for the cattle. Its inner bark is employed in the Himilaya for cordage and coarse cloth, and a kind of paper. The wood is tough and elastic, valued for handles and shafts and bungy sticks, and for the ring for supporting the seat of the single-roped bridge. The leaves largely serve as fodder, wherever it is common and are said to increase the quantity of milk. The bark is made into sandals, etc.—Roxb.; Royole; Cleggorn.

GREWIA ROTHII. D. C., W. and A.

G. salviifolia, Roxb.

A tree of the Panjab, Circars, and of the Cud-dapah Nullamallay; has a light ash-coloured wood, with a straight grain, hard and strong; is much used and very serviceable, and makes good walking-sticks.—Capt. Beddome; Mr. Latham.

GREWIA SPECTABILIS. M'Clist. Phet-woon, Bum.

Very plentiful; attains a girth of about 3 to 4 feet, and grows up tall and remarkably straight, with teak, in the forests of Pegu and Toungoo. Wood white coloured, and adapted for every purpose of house-building.—M'Clist.

GREWIA TILLEFOLIA. Roxb.

G. arborea, Roxb.; G. elastica, Royole.

Thadaal, Butala, . . . Can.; Tharra, Thada, . . . Tam.; Dhaman, . . . Ind.; Charachi, . . . Tel.;

A large and very common tree, all over India and Ceylon. It ascends the mountains to about 1000 feet, and is often of large size in favourable localities. The berries are eaten, having an agreeable acid flavour; the timber is highly prized for strength and elasticity, and is used for building purposes, bows, buggy shafts, walking-sticks, and a variety of other uses. It is light and rather soft, flexible and fibrous, coarse-grained and durable, of a light pinkish colour, turning to light-brown, and easily worked; unseasoned it weighs 45 to 50 lbs. the cubic foot, and 34 lbs. when seasoned; its specific gravity is $5.44$. The leaves make a good fodder, and the bark, like that of all the Grewias, is used as cordage.—Beddome, Roxb.; Voigt; Wight; Gibson; M. E. J. R.

GREWIA VESTITA. Wall. The dhaman.

Gr. elastica, Royole; Gr. Asiatica, Linn.

A tree, 15 to 20 feet high, found in the Sutlej valley between Rampur and Sungnam, at an elevation of 4000 feet; common in the Himalaya at moderate elevations, and in Sikkim, in Darjeeling, in Kashmir, in青海, and Gumsur, also in China. In timber it is highly valued for its strength and elasticity, and much used for bows, buggy shafts, and bungy sticks.
sticks. Its fruit is used to make sherbet. In China, the young branches, leaves, and berries are used in dyspepsia and diarrhoea. In the N.W. Himalaya, the branches are periodically cut in winter time as provender for the cattle.—Chely.jpg; Royal's Ill.; Smith.

**GRIFFITH, WILLIAM, F.L.S.,** a medical officer of the Madras army, author of numerous works on Indian botany. He accompanied the army which marched in 1838-39 from Sind through Quetta and Kandahar to Ghazni and Kabul. From Kabul he crossed the chain of the Hindu Kush to Bannian and Singhah, and spent some time in the Kunar valley; his collections, there amounted probably to about 1000 species, many of which are deposited in the Royal Herbarium at Kew. His collections from Malacca, Tenasserim, the Khassya mountains, and the whole Assam valley, Mishmi and Naga Hills, and Upper Irawadi, Calcutta, Bhiton, Siula, Sind, and Afghanistan, are probably not under 9000 species, which is by far the largest number ever obtained by individual exertions. He also made a collection of birds in Afghanistan. His posthumous notes and journals were published in Calcutta, edited by Dr. McClelland, under the auspices of the Indian Government. A mural tablet, erected to his memory in the cathedral church of Madras, says he was born at Ham, in the county of Surrey, March 1810. He had attained to the highest eminence in the scientific world, and was one of the most distinguished botanists of the age. He acquired his knowledge by personal investigation in the different provinces of British India and in the neighbouring kingdoms, from the banks of the Helmand and Oxus to the Straits of Malacca, where, in the capacity of Civil Assistant Surgeon, he died 9th February 1845, in the 35th year of his age, and the 13th year of his public service in India. *His early death is deeply deplored by numerous private friends; and his loss to the cause of science elicited a public and emphatic expression of regret from the Governor-General of India.* This tablet is erected as an humble tribute to his memory, by a few of his medical brethren of the Madras service.—Hooker *et al.*

**GRIHA. Sansk.** A house.

**Griha Kutumbine, literally, the head of the house or the family.**

**Grihapsa, Sansk., a Hindu married household.**

**Grihapsa-Dharma, Sansk.,** from Grihapsa, situated in a house, and Dharma, religion.

**Griha-Yajna, Sansk., domestic worship, especially the obliteration of clarified butter on the household fire.—IV.**

**Grihya, the sacred fire or altar on which it is kept, first lighted by a Brahman husband on the day of his marriage.—Miller.**

**GRIMM, Jacob,** author of Deutsche Mythologie, published 1835; under the designation Teutonic Mythology, it was translated from the 4th edition, with notes and appendix, by James Stephen Stallybrass.

**GRINDSTONES.**

The natives of India prepare a lap or grindstone composed of shell-lac as its basis, and corundum powder or other hard mineral as the grinding material. In Coimbatore, persons of the barber caste are the manufacturers of these. The stone being pounded and reduced to the form of fine-grained gunpowder, is heated in an earthen pot (chatty). The lac is then added, and the two stirred together until the mass is of the consistence of dough, when it is turned out, and beat and kneaded into the required shape. Not using a mould, the operation is tedious, and the finished article, when completed, not by any means of first-rate excellence. The principal objection to them seems to be the extreme hardness, which renders them less effective than the lap, by a small admixture of a softer substance, were rendered somewhat more yielding. As made there, it is a rather rude though durable machine. At the Hunsur farm, where pearl barley was prepared, English grindstones for making it required frequent renewal, but a lap of this description had been in use five years. The stone used in Coimbatore is powdered coarse garnet sand, found in the beds of the neighbouring hill streams. The corundum stones met with for sale in the bazars are usually small, generally more rounded and water-worn on the edges, as if collected in the beds of mountain streams, from among the pebbles they bring down.

Coarse grindstones are found at Verdachellum in S. Arote, Triputty, and Ootramaloor in Chingleput, Kurse Mungallia near Yellore, Woodimtta and Chellamocoor in the Cuddapah district, and Podelay and Woodingherry in Nellore. Hard gritty kinds, like the bharstone of France, occur in the Pelda Redapully Taluk of Nellore, and near Ghooty. Some of the sandstones of the Guntur, Bellary, Madura, and Mysore districts are very similar to those used as grindstones and flour-mill stones in Europe. Good dry whetstones are those of Nuggur, Matoor hill in Guntur, Tripupthy, Arnee, and Neecheria in Bellary. Fine-grained sandstones of a sharp cutting quality occur at Gootemokoka and Dyda in Guntur, at Chellumocoor and Chettywarappely in Cuddapah, and in the Pedelay Taluk and Woodingherry Hill in Nellore. A stone resembling the Ayrstone or snakestone occurs at Koopookonda, eight miles west of Vinaconallah in Gunoor. Good substitutes for Turkey stone occur at Cuddapah, Woodimtta, Chellumocoor, and Humphsark; and varieties of green and grey granular felspar at Seringapatam, Nellore, and on the banks of the Godavery. The latter are well suited for putting a fine edge on razors and gravers. Hones, silicious and slaty limestones of every quality, accompany the extensive beds of lithographic marble near Kurnool, Guntur, Bellary, Datchapally, and Gootty.

Grinding of grain in India is still done by the hand-mill, as in Isaiah xlvi. 1, 2, Matthew xxiv. 41.

This very beautiful flowering plant is a shrub or small tree, and is found in the islands of the Indian Ocean, in China, and in every part of the continent of India, especially in the jungly tracts.
at the foot of its several ranges of mountains. It grows in the N.W. Himalaya up to 4000 feet, is common in exposed places in the Maturtne and Ova districts of Ceylon up to an elevation of 4000 feet, and is very common in the Prone district. Its bright red calyx retains its colour till the seeds are ripe, gives the whole plant a very showy appearance, and points it out to the collectors of its flowers, which form an article of commerce, and are used for a red dye. In the bazaars of Bengal they are found in a dry state, under the name of Datokhe. Sheep-skins steeped in an infusion of the dried leaves take on a fine red, of which native slippers are made. The dried flowers are employed in N. India, under the name of Dhauri, in dyeing with morinda bark. In Kandesli the flowers form a considerable article of commerce, inland, as a dye. It grows abundantly in the hilly tracts of the N. Circars. Its gum, called Dhauka or Dhau-ka-gond, is brought from Mowar and Harowtee, and is abundant, white in colour; and, like the katira and tragacanth gum, swells in water. In cloth-dyeing it is applied to those parts that the dye is not wished to touch. It is eaten in Luddoo; one maund costs ten rupees. Its wood is used for fuel, and by liquor distillers for fermenting liquor; its leaves are used in infusion as tea.—Irune; O.Sh.; McIl.; Stewart; Clep.; The. Zeyl.

GRITACHEE. SANSK. In Hindu mythology, a celestial cousin, from Ghrita, clarified butter, and Anch, to worship.

GRITSA-MADA, the author of many hymns in the second mandala of the Rig-Veda.

GROBAGAN is in Burna. Here, in the limestone district, is a mud volcano, 16 feet in diameter. The black mud every two to five seconds bubbles up and subsides; it rises to a height of 20 to 30 feet, then explodes with a dull noise, scattering a shower of warm black mud in every direction. Round about are warm brine springs, from which salt is extracted. Its eruptions are most frequent in the rainy season. It is called Kowga, the place of abode; and an old legend is, that it is the residence of a monster snake, whose writhings cause the eruptions.—Oldham in Yale's Embassy.

GROSSULARIACEÆ, the current worts or current tribe of Lindley. They are unarmed or thorny shrubs, arranged in five genera, one of which, the genus Ribes, occurs in India. R. grossularia is the gooseberry; R. rubrum is the red currant, and R. nigra is the black currant. Dr. Roby regards the Himalayan Ribes as a distinct species, and names it R. Himalense.—Voigt.

GROUND FISH, the Bora-chung of Bhutan. It inhabits the gills and slow-running streams near the hills, but is found also in ponds and banks, into which they penetrate from one to five or six feet, and are found generally two in each chamber, coiled concentrically like snakes; the entrance is generally a few inches below the surface, so that the fish can return to the water at pleasure. It is believed that they take possession of holes made by land-crabs. The bora-chung would appear to be a species of Ophiocephalus, probably the O. barka described by Buchanan as inhabiting holes in the banks of rivers tributary to the Ganges.—Dr. Campbell; Tennant's Ceylon. See Fish.

GROUND-NUt.

GROUND-NUT, Earth-nut; Japan, China, pulse.

The ground-nut is the fruit of the Arachis hypogea. The plant has somewhat the appearance of the dwarf garden pea, though more bushy. It is cultivated in the S. of Europe, largely in America, Africa, Asia, Australia, and the Archipelago, and is named from the circumstance of its introducing its fruit or pod into the earth, for the purpose of ripening its seed. The flowers, leaves, and stems are produced in the ordinary manner seen in the pea tribe. When the yellow flower has withered and the seed fertilised, there is nothing left but the bare stem which had supported it. This stem, in which is the germ of the future fruit and pod, now grows rapidly in a curved manner, with a tendency to arrive shortly on the surface of the ground, into which the now naked stem penetrates several inches. In this obscure position the fruit takes its ripened form, and is either gathered from its hiding-place, or left to the future season, when its time of rising into new existence calls it from its natural position. When mature, it is of a pale yellow colour, wrinkled, and forms an oblong pod, sometimes contracted in the middle; it contains generally two seeds, a valuable article of food in the tropical parts of Africa, America, and Asia. They are sweetish and almond-like, and yield an oil when pressed, not inferior in quality to that obtained from the olive. The leaf resembles that of clover, and, like it, affords excellent food for cattle. The cake, after the oil is expressed, forms an excellent manure. The Arachis seeds are usually sown in the dry, warm weather from May to June, and are placed at the distance of eighteen inches from each other. Insects are fond of them; and if the season is cold and unfavourable to them, or the growth retarded, they become musty and bad, or eaten by insects. In some parts of America it yields from 30 to 80 bushels of nuts per acre. On the western coast of Africa it is planted to a great extent. In South Carolina the seed is roasted and used as chocolate. The leaves are used medicinally; it is greedily devoured in the green state by cattle. Two varieties are grown in Malacca, the white seed and the brown seed; and also in Java, in the vicinity of sugar plantations, the oil-cake being used as manure. It is there known as Katang. The seeds are consumed as a cheap popular luxury, being half roasted, and then eaten with salt.

Ground-Nut Oil, Manilla nut oil. This valuable oil is obtained by expression from the ground-nut, and, under favourable circumstances, the Arachis will produce half its weight of oil. When heated and pressed the quality is very considerably improved. This oil is good for every purpose for which olive or almond oil is used. For domestic purposes it is esteemed, and it does not become rancid so quickly as other oils. In lamps, the brilliance of its light is superior to that of olive oil, and its durability is seven minutes per hour beyond the combustion of the best olive oil, with the additional advantage of scarcely any smoke. Under the term ground-nut oil, or Manilla oil, there was exported from the Madras Presidency, in the four years 1852-53 to 1855-56, chiefly to the United Kingdom, Bon-
bay, and the Indian French ports, to the amount of 534,024 gallons, valued at Rs. 2,12,896. 1950 parts of seed, separated from their coverings and blanched, give 1405 of kernels, from which, by cold pressure, 703 parts of oil are procured. For machinery the naval steam cruisers on the African coast adopt it. Ground-nuts from the river Gambi and from Sierra Leone, at £10 per ton, sell in London at £11. From France the oil finds its way over the world in the shape of olive oil,—the skill of the French chemists enabling them to imitate the real Lucca and Florence oils, so as to deceive the nicest judges.—Eng. Cyc.; Ed. Phil. Mag.; Simmonds; Jury Rep. Mad. Ex.; Useful Plants; O'Sh.

GROUND RANATANS. The excellent walking-sticks known to the British under this name, are made from the Rhapis flabelliformis, which grows in Lin-kin and Southern China. See Calamus.

GROVES of trees were planted by the ancient Egyptians within the courtyards of their temples, but the law of Moses (Deuteronomy xvi. 21) forbade the Hebrews to plant any tree near the altar of the Lord, though the Alexandrian Jews, in later times, planted groves near their synagogues. Individual trees, throughout India, are regarded as habitation of spirits, both good and bad, and noon is the particular period at which their evil influence is believed to be exercised. In the Fiji Islands a fine grove exists in the Rewa district, near the mission station of Mataiura. These sacred groves and trees are not worshipped as gods, but, as in the Odin religion, are looked upon as places where certain gods had taken up their abode. Hindu kings formerly planted mango groves as acts of merit, and gave them to Brahmans or to the public.—Fiji Islands; Ward, iii. p. 107.

GRUB, a term familiar to coffee planters in Ceylon and the Peninsula of India, applied to insects which injure the coffee plant and coffee berry. Mr. Nieter tells us that the brown and white bug and the black and white grub are the only important enemies of the coffee tree, and that the destruction caused by Arhines, Limacodes, Zebuzera, Phymatea, Sthricia, and the coffee rat, appear to be of a more local and occasional nature.

Bug.—The appearance and disappearance of the coffee bug, he tells us, is most capricious. It comes and goes, now rapidly spreading over a whole estate, now confining itself to a single tree amongst thousands; here leaving an estate in the course of a twelvemonth, there remaining permanently; sometimes spreading over a whole estate, sometimes attacking a single field, then leaving it for another and another. But the white bug prefers dry, and the brown, damp localities, the latter being found more plentiful in close ravines and amongst heavy rotting timbers than on open hill sides, and it is probably to this predilection that the shifting of the insect is attributable. The bug of course seeks out the softest and most sheltered parts of the tree, the young shoots, the undersides of the leaves and the clusters of berries. The injury done by the white bug seems more severe than that from the brown, but, not being so plentiful as the latter, it is of less general importance. The white bug is especially fond of congregating amongst the clusters of berries, which drop off from the injury they receive, and trees often lose their entire crop in this manner. The injury produced by the brown bug is the weakening of the tree, and is thus more general, but the crop does not drop off altogether nor so suddenly. With white bugs on an estate the crop can hardly be estimated; with brown bugs it can.

White Grub.—Under this name are included the larvae of various Melolonthide, the cockheavers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. Mr. J. L. Gordon of Rambodde considers the white grub to be by far the greatest enemy of the coffee trees which the planter has to contend with, as he never knew a single tree recover after their attack; and he adds that they had destroyed at Rambodde, in two years, between eight and ten thousand trees of fine old coffee. Mr. Gordon used to dig up the soil at the foot of the trees and take out such grubs as he could find.

Black Grub.—The larva of the moth called Agrotis segetum is the very destructive black grub. This pest is about an inch long, and is most abundant from August to October. The caterpillar lives in the ground, but comes out at night to feed, and is very common and injurious. They attack not only coffee trees, but all sorts of vegetables and flowers, and are very destructive to gardens and in the field, as they eat everything that is artificially raised, despising grass and weeds. They generally appear only on certain fields, and will not go over an estate. The insect is not confined to Ceylon; its ravages are well known in India, at the Cape of Good Hope, and in Europe, where it injures the grain and beetroot crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off, and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated, when it is mentioned that Mr. Nieter lost by them in one season, in certain fields, as many as 25 per cent. of the young trees he had put down.—Nieter on the Enemies of the Coffee Plants. See Bug; Coffee; Leaf Disease.

GRUBBER and Dervile, two Jesuit fathers, who in a.d. 1661 travelled from China via Tibet. They were the first Christians from Europe who are known to have penetrated into the populous parts of Tibet. Marco Polo in his journey in the 13th century, was to the N.W. by the sources of the Oxus.—Priness, Tibet, p. 11.

GRUNDLEY. John Ernest Grundley, an eminent missionary at Tranquebar, to whom George r. of England, in a letter dated 23d August 1717, addressed an autograph letter.

GRUNTH is the name of the books of the Sikh religionists. Grunt’hee, from Gruntha, a book, one who is learned in the Grunth. The Adi Grunth compiled by Nanak and his immediate successors was translated by Professor Trumpp. Nanak quotes largely from Kahir. The Grunth of Guru Govind Singh of a later date is written in Gurmukh, the Sikh alphabet.

GRUS, a genus of birds belonging to the family Gruidae, in which are the genera Grus and Anthropoidae. The words Grane, Grus, Geranos, with the Hindustani Saras, Kakarra, Karrach, etc., all have reference to the loud trumpeting voices of the birds in question, which form a very distinct group by themselves, that should be confounded with no other. The so-called gigantic crane or
adjutant is not a crane, and can merely clatter its mandibles together. The word Crane is often used vaguely.

Grus Antigone, Linn., Sarat, Sarhans.

G. torquata, Vuillot. | G. orientalis, Pallas.

The saras is found throughout the greater part of India and Burma. It breeds on some island or spot nearly surrounded by water. Its fine trumpet call, uttered when alarmed or on the wing, can be heard a couple of miles away. In the territories of Holkar it is almost venerated. It breeds south of the Himalaya, and birds too young to fly are occasionally brought for sale to Calcutta. Turner, describing the lake Rantuch, says prodigious numbers of the saras are seen here at certain seasons of the year. Instances are known of the saras breeding in captivity. A pair was allowed the range of a large walled garden (protected from jackals), containing shallow inundated enclosures for the growth of rice. Their nest was commenced under water, and raised for some inches above the surface; the eggs are two in number, about 3½ inches long by 2½ inches broad, of a bluish-white, with a few distantly-placed rufous specks and blotches.

Grus Australasiana, Gould, is the native companion of the Australian colonist; has more of the aspect of G. vulgaris, Pallus, but is considerably larger. It is only found in N. Australia and N.S. Wales. It evinces great aptitude for domestication, and gets its name native companion from the docility with which it accommodates itself to the society of man.

Grus Cinerea, Bechstein. | Ardea grus, Linn.

The crane of Europe, Asia, N. Africa, is migratory; now rare in Britain. In Scandinavia it usually breeds in extended morasses, far away from the haunts of men. It makes its nest, consisting of stalks of plants and the like, on a tussock, and often amongst willow and other bushes. The female lays two eggs. The European crane is equal to any in the majesty of its gait, and even in the beauty of its plumage, if we except the Manchurian. It is the most widely distributed of the whole family; visits India in numerous flocks during the cold weather. In the Dekhan and Central India it is generally seen in parties of from eight to twenty, but sometimes in much larger numbers, especially in the N.W. Provinces. It feeds chiefly on grain, and commits great havoc in the wheat-fields and rice-fields.

Grus Lencogeranos, Pallus, is the large white crane; visits several parts of N.W. India, and the interior of the Himalayas in the winter season.

Grus Monacha, Temminck, is from N.E. Asia and Japan, as also is Grus vipo, the white-necked crane, an ornamental species.—Blyth.

GRYLLOTALPA VULGARIS; Mole cricket. Goorhgoorha, | Hind. | Ghooorhgoorha,

Occurs in the temperate and tropical regions of the Old World. It is of nocturnal habits, and is a destructive creature of all vegetable products. In Dinapur and Bankapur, in November and December, it attacks the young poppy plant.

GRYLLUS CAMPESTRIS, in China, about midsummer are made to fight with each other. They are sold at rates from a few cash to tens of dollars, and there is much gambling and betting on them amongst all classes. Gryllus migratorius is the common locust. There are, however, other locusts, one of them of a red colour; species of Gryllus (Ghulya and Phanga, Hind.) attack the young poppy plant in November and December in Lower Bengal.

GUALACUM OFFICINALE, Lignum vitae.

This plant was introduced into the Madras Gardens, and found to thrive remarkably well. It is a native of Jamaica and Hispaniola. Both the bark and wood are used as sudorifics in the treatment of gout, rheumatism, and chronic or secondary syphilis. The resin is obtained by spontaneous exudation.

GUALAMA, the Singhalese devil-bird, supposed to be a owl or a night-hawk. Its shout is clear, resembles that of a human being in agony, and can be heard to a great distance.—Tennent.

Biyawak, Bewak, Malay. Udum, | Makrak, | Manurak, | Patna.

The iguana, a reptile of India, found about old walls and underground buildings. It is about two feet long, tail long and tapers off; eyes, back, tail, and throat are serrated; its whole surface is covered with shining scales. The flesh is eaten by the Mahomeans of India, and in the West Indies it is salted and barreled for exportation. In India the body of the dried guana is made into an eucalyptus, with a certain portion of ghi, and used as a strengthening medicine in consumptive complaints. An animal oil is obtained from it.—Foulkner.

GUANO, the accumulated dung of sea-birds, found on many islands. The white layer of the first year is considered the best. A variety of guano found in the limestone caves on the Tenasserim coast is much used as a manure by European and Chinese planters in Pinang and Province Wellesley. M. A. Ramonde, Professor of Natural History at Lima, was sent in 1853 by the Peruvian Government to the Chinchas Islands. In some places he found guano up to 30 feet in depth. From the bodies of animals as well as from various manufactured articles found in it, he concluded that the deposit belongs to the present epoch of the earth's history. The birds observed during his visit were—Pelecanus magus, Molin; Carbo Gaimardii, Lesson; C. albipalla, Branfil; Sula variegata, Tschudi; Spheniscus Humboldti, Meyen; Plotos anhing, Linn.; Rhynchoptera nigra, Lem.; Larus modestus, Tschudi; Puffinaria Garnotii, Lesson; Sterna inca, Lesson. Some of them only appear at the breeding seasons. The pelicans do not seem to produce much guano, as they almost always inhabit the cliffs, and their excrement falls into the ocean. The same may be said of the species of Carbo. The species of Sula contribute more to the deposit, their number being greater, and their habitats being more in the interior of the islands. The species of Plotos and Rhynchoptera are very rare, those of Larus more numerous. The Sterna only visit the islands to lay their eggs, but their numbers are so very great that they must contribute in a great measure to the formation of guano. The Spheniscus abounds in the southern island,
which is inhabited. These birds not being able to fly, hollow out habitations for themselves in the guano. The birds which produce the largest quantity of guano are the Puffinaria; their number is incalculable. — L. Institut. May 1856; Ed. New Phil. Jour. November 1856.

GUARAPU. A drink prepared from sugar-cane.

GUARDAFUT, the Ras Jardan of Hafin of the Arabs, meaning the Highland of Cret of Hafin. A cane, or head of the coast of Africa, nearly opposite Alden. It is the Opone of Ptolemy.

GUARD FIS, eaten at Penang. It is the Hemiarphus Russelli, Cuc., the Toda pendex of the Malays. See Fish.

GUAREA TRICHLIOIDES. Its bark is a violent emetic and purgative. Wight in Icones gives G. paniculata.— W. Lc. : O'Sh.

This moderate-sized tree grows in the Bengal and Madras Presidencies, and is common in the Bombay coast and Ghat forests. It may be easily recognized by its great straightness and handsome appearance. Its wood is reddish and close grained, useful in carpentry, as well as for naval purposes, as boat masts, small spars, etc. The natives on the Godavery do not use it, and say that it is soft.

A very handsome, erect, growing, large tree of India and Java, but with a soft and useless wood. It is much grown in Madras as a highly ornamental avenue tree, and it should be planted in avenues more than it is at present. The true asok, Jonesia asoka, is rarely seen in Southern India.—Roxb.; Voigt; Wight; Beddome.

There are two kinds of guava fruit largely grown in India and in the islands of the E. Archipelago,—one white within, the other red. The wood is extremely close grained, tough, and compact; is preferred for making wooden mallets, and other things required to stand hard knocks; and it is also used for wood engraving. London says 'the fruit ripens freely in Britain, but is of little merit.' The white guava is the species more usually cultivated, but the red is not uncommon.—Mason; Ains. Mat. Med. p. 211.

The Guazuma is a genus of the family Sterculiaceae; and G. tomentosum, sometimes known as bastard cedar, the gunstock tree, was introduced by Dr. Anderson about the end of the 18th century from America. It grows in Ceylon; common in the Deklan, pretty common about Madras. The fruit is tuberous, about the size of a cherry. Between its outer bark of sap-wood is a fibrous substance about half an inch in thickness, richly impregnated with mucilage, which is extracted by macerating for twelve hours in warm water; and is greatly employed in the West Indies and in South America in clarifying sugar, as a Kydia is in India. Its wood is light and loose grained, and of a light-brown colour, and is used for furniture, coach panels, for packing-cases, paneling, etc. It weighs about 40 to 45 lbs. per cubic foot unseasoned, and 32 lbs. when seasoned, and its specific gravity is .512. It was largely cultivated at one time in the Madras Presidency, under the name of bastard cedar, as fodder for cattle. The fibres of its straight, luxuriant young branches were submitted to trial by Dr. Roxburgh; and while the hemp broke when dry with 160 lbs., and 209 lbs. when wet, that of the bastard cedar broke with 100 lbs., when dry, and 140 lbs. when wet.—Chishorn, M. E. J. R.; Thou.; Voigt; Riddell; O'Sk; Royle, Fil. P.

GUADA, Gode, Gudi, as in Nanajongde, Methagoo, is probably from the Telugu and Karnatica Gudi, a temple, a pagoda. Gud, Mah., a house. GUDA, a mixed race in Sind, from Sindias and Sidi women; they were equally slaves with their mothers, and could be bought or sold at will. —Postan's Ind., p. 359.

GUADAIR. SANSK. A beggar, so named from their carrying a metal pan containing scented wood. See Hindu; Ukbara.

GUDBA, a Kolarian tribe, numerous in the eastern part of Bastar and Jeypore, but scarce to the west of Bastar. Some of their most important words are identical with those used by the Kurki in the W., and by the Kol and Suntal on the E. —P. C. G. Rep. p. 6.

GUDDEE, a tribe resembling the Ghosi. They are now mostly Mahomedans, and have a few scattered communities in Goomkootsar and Surava of Meerut, and in the Rumpur territory. It is not unusual to call any converted Hindoos a Guddie, which is looked on by a Mahomedan as a term of reproach. A Guddie tribe occupy the Kangra Hills. Elliot, Supp. Gloss. See Gudha.

GUDDI PADA, flying of paper kites at the new year on the new moon of Chaitra, about the 5th April.

GUDEER, a feast celebrated by Shahi Mahomedans. See Ghadir.

GUD'HA. Hind. An ass, a donkey, Gadheka-hal, a donkey's plough. Before the British domination in India, it was not uncommon to yoke donkeys in a plough and drive them over the ruins of a captured fort, as a mode of showing mass about half an inch in thickness, compact. The furrows thus raised were levelled by the tabor, ki-mye, or iron harrow. Horace says (Carm. i. 16): —

"Exito gravii
Stravere, et a/Is urbis ultimae
Stetere causa, cur perirent
Punditis, imperatoreque moris
Hostile aramum exercitus insolens."

This mode of wreaking vengeance has been in especial favour with eastern nations, and was
practised by Chengiz Khan and Timur with unrestrained severity. Hence the common expression, 'I shall saw barley where you now stand,' as in the vaunt of the bandit minstrel Kurruglow, at p. 138 of Popular Poetry of Persia.

Gadhe-par-Charhana, literally, to seat upon a jackass, is a punishment more commonly known by the Arabic Taskheer publication, celebration; which is rendered by Golius, 'Per urben duci jussit solum in exemplum: fere asino aut caneno impositum.'—Elliot, Supp. Gloss.

GUDHI or Guri, a ceremony amongst the Maharrats. A pole is erected on the first day of the year before the house-door, and ornamented with cloth, mango sprigs, etc.—W. GUDI. Tel. A temple. This may be the word from which Pagodhas been obtained. Pagudhi, a devil temple.

GUDIGAR. KAR. A caste at Nager in Mysore, carvers in sandal-wood, horn, and ivory.

GUEST, amongst several of the eastern nations, the dread to be held to a guest are still regulated as in ancient times. Luke x. 7 says, 'Go not from house to house;' and it would be a great offence among the Hindus if a guest, after being made welcome at a house, were to leave it and go to another. Also Luke xiv. 6, etc., 'A certain man made a great supper, and bade many.' Messengers are sent to invite guests to a Hindu feast, when not only relations, but all persons of the same division of caste in the neighbourhood, are invited. A refusal to attend is considered as a great affront. Mark xiv. 14 says, 'Where is the guest-chamber?' Respectable Hindu householders have a room which they call the stranger's room (Attie-hee-shale), and which is especially set apart for the use of guests. Lane, in his Modern Egyptians, p. 443, answering the question, What does a musair (traveller) expect and receive? says, 'By a Sunnche law, a traveller in the desert may claim entertainment for three days unquestioned.' Most Bedawi will suffer almost any injury to themselves, rather than allow their guests to be ill-treated. In the great tribe of the Bihaseen which inhabits the desert between the Nile and the Red Sea, unmarried daughters are offered to guests.

GUETTARDA SPECIOSA. Linn.

Cadamba jasminiflora, L. | Jasminum sambac, L. | Wilcke.

Pannir, DUKH', TAM., TEL. Himma, . . . | SANSK.

Rava-pu, . . . | MALAUK.

Nili-pitchea, . . . | SINGII.

A small but very handsome tree, with large white and very fragrant flowers, in blossom throughout the year. It grows at Calcutta and near Galle in Ceylon, and is cultivated in Indian gardens. Amongst Hindus the tree is sacred both to Siva and Vishnu.—Roxb.; Riddell; Ain.; Thou. Zeyl. ii. p. 103.

GUERO UPAS, or Valley of Poison, is on the side of the volcano Papandayan, in Java. It is 500 feet below the run of the old crater, which is now the Telaga-batu or White Lake. It is a small barley place, with many creevices from which carbonic acid is poured; and many dead animals, dogs, cats, squirrels, rhinoceros, tigers, birds, and snakes, are said to be seen in it, but this has lately been discredited.—Bikmore, p. 58.

GUGAL, a term applied in India to the fragrant residuals of several trees, also to the trees themselves. The resin, Gugalam Telugu, is also called Gugal-ka-Gond, also Indian B'dellium, and its synonyms are given as Moogl (Arabic), Baughan turb, and Allatun. In Syrian, the Makhzan-ul-Adwija says it is called Badliyun, which is like a corruption of B'dellium. It is the fragrant gum-resin of Balsamodendron Roxburghii, the Amyris agallocha, a tree which is plentiful in the Ajmir Hills, and which yields a fragrant gum-resin used in sacred fumigations by the Brahmons; it is no doubt the B'dellium of the ancients. It has a similarity to myrrh; is used also in flatulencies, taken in ghi; is one of the ingredients in the incense or dhoop. The word Gugal in combination, when applied to a tree, indicates particular plants yielding resins, as Guggilam chettu, Agieceras fragrans, Kon.; Guggulu or Sala is Vatica robusta; and Guggilapu chettu is Boswellia glabra.—Elliot, Fl. Andar. See B'dellium.

GUFE or Hundes, 120 miles long and 15 to 60 broad, is commonly known as the plain of Tibet. It is comprised between the Himalaya and its Caspian branch. It extends from the Kansarwar and Rakastal down the course of the Sutlej to Kanawar. It is wholly under Chinese influence. Its undulating surface is covered with an alluvial deposit, declining from 15,200 feet, the level of the lakes, to 10,000 feet at the confines of Kanawar. The Sutlej and its feeders traverse it, flowing in deep narrow ravines 1000 to 3000 feet below its mean level.—I. f. et T. 223.

GUGLI, a class of Brahmons at Vaishnava shrines.

GUHA or Gooha, in Sanskrit a secret place, from Gouli, to hide or to cover; hence Guhya, parts requiring to be concealed. In Hindu mythology, when the goddess Sati burst, and the gods in her womb came forth, this part of her body fell in Nepal, where, at a place called Guhyasthan, they continue to be devoutly worshipped.

GUHURWAR, also written Gahurwar, a tribe of Rajputs found in Dehra Mungalpur, Bithur, Gajnow, Kanauj, and the Central Doab. The Gahurwar of Khera Munogore in Mirzapur have been converted to Mahomedanism, and those of Mahaic in Ghazipur are reckoned an inferior branch. The chief of the Gahurwar resided at Bijapur, a few miles to the west of Mirzapur, where the liberality of the British Government enabled him to keep up some show of respectability. At the time of the first occupation of Benarees by the British, he was a fugitive from the tyranny and oppression of the Goutum Blinmar, who had expelled the Gahurwar family in A.D. 1758. The Gahurwar are recorded among the 36 royal tribes of Rajputs, and are said to be of the same family as the Rathor, with whom it is said they never intermarry.—Elliot, Supp. Gloss.

GUHWARA. HIND. A swinging cradle.

GUIHAKA are cave-dwellers, Hindu demi-gods; the servants of Cuviera, the deformed deity of riches, and he who brings the dark souls of men, addicted in this world to vices and confabulations, transmigrates.—Moore, p. 108; Wilford.

GUI, amongst the Oraon, a sworn friendship between two girls. They each say, 'Tu aar main gai jurabi; Amren phul jagabi.' Then each plucks flowers and arranges them neatly in the other's hair, exchange necklaces and embrace, and give a joint feast. See Brother-making; Munh bula-bhai.
GUIA KHATAI. A Bokharian Hakim presented Dr. Honigberger with this hard, pitch-like plaster spread on a small piece of red linen, which he stated had been prepared in China, and which was capable of removing every kind of pain, simply by application. One and the same plaster serves for several cases. The form is square, three or four inches in diameter; each of them bears a Chinese seal. According to the assertion of the Hakim, its constituent parts are sweet-oil and litharge; the latter, an indiscernible powder, is added to the former. The Bokharian doctor stated that it should be applied as near as possible to the affected part. It acts as a rubefacient, without blistering.—Dr. Honigberger, p. 252.

GUILANDINA BONDUC. *Linn.*

A great thoroy climber, with yellow flowers, and with long briar-like trailing and climbing shoots. It grows in the East and West Indies, and the Eastern Archipelago. The bonduc nut is an irregularly round grey seed; the almond or kernel is white, very hard, and intensely bitter; it gets a blood-red colour from nitric acid. Mr. Piddington detected in the nuts, oil, starch, sugar, and resin. Bonduc nut is the commonest antiperiodic in the bazar medicines of Bengal, and it is undoubtedly one of considerable utility, especially in convulsions from fever. If it do not stop the paroxysm the first time, it seldom fails the second. The common way of exhibiting this substance is to give of the nut finely powdered and of black pepper each 6 to 20 grs. three times daily. In the Panjab, asefaotida is added to the black pepper. In Chittagong it is administered in pills, 4 grains of the pounded kernel with 4 grains of the black pepper. It is a very effectual remedy, but to make it so the pills must be given fresh. If the seeds are not broken they will keep good for years; but if broken, and the kernel kept for four or five days, they become useless as a medicine for fever. Bondunc nut oil is mentioned by Ainslie as useful in convulsions and palsy.

GUILIELMA SPECIOSA, *Mart.* is the Piritu or Pirijao of Venezuela, the Pupumbo of the Amazon district, and the Paripon of Guiana. It is a palm of an intensely hard wood; sharp needle-like spines are thickly disposed in rings or bands round its slender cylindrical trunk. The Indians subsist for months on its farinaceous fruit.—Seeman.

GUINDY, a hamlet and country-seat of the Governor of Madras.

GUIANA FOWL. *Nomina melaeasis, Linn.* is believed to be descended from the Numida ptilorhyncha of the hot, arid parts of E. Africa, but it has become wild in Jamaica and St. Domingo, and has there become small, with black legs. The guinea-fowl is the Bohemian of the barnyard. They are hardy and prolific, and are valuable in gardens, as they rarely scratch the ground, are eager in their search for insects, and with a scraping motion of their bill gather the seeds of grasses.—Darwin.

GUIZA GRASS, Panicum jumentorum. When well manured and kept clear of weeds, it grows luxuriantly, and admits of being cut every six weeks or two months. A small patch near Colombo, about an acre and a half, for 7 or 8 years supplied 3 or 4 milch cows and from 5 to 7 horses continually with all the grass required for their consumption, and latterly left a surplus which was dried for bedding and hay. When first planted it frequently attains a height of over 9 feet; and a stalk taken promiscuously from a small patch planted in Combonaco measured 1 foot 45 inches in length; when cut two or three times it grows thicker, but not so high. Mr. Wedderburn in Coimbator with the view of utilizing the washings in the municipal slaughter-house, had a piece of neighbouring waste land, in extent four acres, enclosed and irrigated by the diluted filth of the slaughter-house floor. Besides this, pondrette, consisting of night-shade and such was applied. These four acres of land produce annually thirty-two tons of guinea grass, at ten rupees per ton. This nourishes bullocks better than double the weight of paddy straw at seven to ten rupees per ton. It is excellent feeding for horses and cattle, and is generally preferred by them to the ordinary country grass, though horses which are hard worked seem to prefer the dry grass roots supplied by the grass-cutters. It should not be given to cattle fresh, but the supply for one day should be cut the day previous; and it should not be cut too close to the ground, but the stalk ought to be left 7 to 9 inches high. It is a good plan to move the ground between the roots every time the grass is cut, and it should be heavily manured after every three or four cuttings. It is very hard, and may be easily propagated. It requires abundant moisture, but will not live in a soil which is at all marshy. It answers best planted in small tufts 1 foot 9 inches to 2 feet apart, which rapidly spread into stools from 6 inches to a foot in diameter.—Spry's Suggestions, p. 15.

GUIZOTA-WORM, Filaria Medinensis, *Gmel.*

Paretiti, . . . ABAR. Dracunculus, . . . LAT. Drakontion, . . . GR. Pejsuk, . . . JUSPE. Nara, Narm, . . . HIND. Sougenw, . . . SEENAR. Langan, synchron, . . .

It occurs in Africa, Arabia, Persia, India, and Turkestan, most frequently appearing in the feet and legs. It has been supposed to be transmitted by the means of the cyclops,a little fresh-water crustacean received by means of the drinking water. At the end of six weeks the presence of the animal is revealed by tumours; then wounds appear, caused by the dissemination of the eggs. Gordius ornatus occurs in the Philippines.

GUITAR, a musical instrument similar to the cither, supposed to have obtained its name from the Sih-tarn, the three-stringed.

GUIZOTIA OLEIFERA. *D. C., W. III.*

Ulisi, Valisi, Valasalu, Telisi, Valisal, *Fam.*

This plant is grown in Egypt, Abyssinia, and throughout the East Indies. It has large bright yellow-coloured flowers, and it ripens its seed in February and March. The seed in shape is like the black cummin seed, and a sweet-tasted oil is
GUJERAT.

manufactured from it, and used for nearly the same purposes as the sesamum or gingelly oil. The seeds yield about 34 per cent. of oil, which sells at about 10d. per gallon. It is exported under the name of Niger seed. It was first shipped to London experimentally in 1851. It is a favourite crop, of easy cultivation, and giving good returns.—*Mad. Ez. J. Rep. Col. Cat.*, 1862.

GUJAH, a race in the N.W. Provinces of India, notoriously predatory, but gradually becoming more settled to habits of peaceful Industry. Their former importance may be rated by their having given name to provinces of Gujerat on the western coast of India, and to Gujerat in the Punjab. They are sometimes considered to be among the prior occupants of India, and have been so reckoned by Tod, who declares them also to be a tribe of Rajputs. Sir R. Jenkins also says that in the Nagpur territory they consider themselves to be Rajputs, and that, as they are descendants from Lava, Rama's second son, they have an undoubted right to be so regarded. They must at one time have been dominant, for Edrisi, quoting Ibn Khordadbah, states that Juur or Hurz was the hereditary title of a king as well as the name of the country. Guar are in Kashmir, in the Punjab, and are spread all over the Dehli territory, the Upper Doab and Upper Rohilkhand, and they enumerate 84 different tribes. In Dehli the chief tribes are the—

In the Doab—

In Rohilkhand—

K’usanne. Bavee.

All these tribes intermarry on terms of equality, the prohibited gotra or tribe being only those of the father, mother, and paternal and maternal grandmother. A great part of the district of Saharanpur was called Gujerat during the 18th century. By the Gujar themselves it was said to consist of three parts, and the division is known amongst them to this day, and is usually adopted in ordinary converse. In 1811 Colonel Tod's duties called him to a survey, amidst the ravines of the Chambal, of the tract called Gujargar, a district inhabited by the Gujar tribe. Turbulent and independent, like the sons of Esau, their hand against every man, and every man's hand against them, about the middle of the 18th century, their nominal prince, Suraj Mull, the Jit chief of Bhruptur, had pursued exactly the same plan toward the population of these villages, whom he captured in a night attack, that Jannema did to the inhabitants of Mahahurkat. He threw them into pits with combustibles, and actually thus consumed them. The Gujar race has largely pressed into the Central Provinces of India, and have settled down to agricultural pursuits; and those in Hoshangabad and Nemur are fair farmers. They are agriculturists in the N.W. Provinces, but, whether of the Hindu or Mahomedan faith, they everywhere prefer pasturage to the plough. The Gujurs of Kashmir are shepherd proprietors, and said to have come from Gujerat in the Punjab; they live in log houses, in recesses at the foot of the Panjal, and in the woods. The Gujar tribe in the Panjal are probably of primitive antiquity. They have not lost the pastoral habits of their race, though they devote much attention to agriculture, and they are more industrious and less predatory than their brethren of Hindustan. Many of the thieves in Hindustan are of this tribe.

In 1857, in the revolt in India, the whole of the Gujar villages around Dehli, after fifty years of compulsory quiet, broke out and plundered all over that district within a few hours of the outbreak of the mutiny. And whenever any fugitives during the mutiny came to a Gujar village, they were invariably plundered. The instant the strong arm of a government was removed, these and other predatory races resumed their ancient habits. They are cultivators and keepers of cattle and buffaloes, living in separate villages of their own, and are numerous about Dehli and in the Merut and Saharanpur districts of the Doab. They are numerous in the Panjal, on the northern frontier of British India, in Swat and the adjacent hills, and in the hills about Kashmir; and they are said to have preceded the Swat tribe as the inhabitants and owners of part of the Hazara district east of the Indus. In the hills about Kashmir the Gujars have pastoral vagrant habits. In all the northern, if not in all the Jat country, the Gujar are much mixed with the Jat, and form a considerable part of the population. They are numerous in all Northern Rajputana, and extend into Malwa and the adjoining parts of Central India as far east as Bundelkhand, one of the chiefs in which is a Gujar. The last Nagpur prince is stated to have been a Gujar, but at present there are no Gujar in Gujerat. Those located in the east in Hindustan, trace their origin from the west.

The Gujar have no resemblance to the pre-Aryan races. They are a handsome tribe, and both men and women are noted for their powerful figures and fair comPLEXIONS. They are particularly remarkable for the height and strength of their men, and their women are proportionately tall. They are remarkable for their hardihood and endurance, their self-denial, and their heroism. They are noted for their fondness of the chase, and are most expert in the use of the bow and arrow. They are men of enterprise and enterprise, and are noted for their love of adventure and adventure. They are noted for their love of adventure and adventure. They are noted for their love of adventure and adventure. They are noted for their love of adventure and adventure. They are noted for their love of adventure and adventure. They are noted for their love of adventure and adventure.
GULAL.

Gujarat gives its name to a British revenue dis-

trict, lying between lat. 32° 10' 30" and 33° N.,

and between long. 78° 20' and 74° 31' E., with an

area of 2029 square miles, and a population in

1868 of 616,847 persons. There are numerous re-

lics of antiquity in this district, and mounds of

ancient construction yield considerable numbers

of early coins. General Cunningham has identi-

cied one of these shapeless masses, now occupied

by the village of Noga or Mong, with the site of

Nikaea, the city built by Alexander on the field of

his victory over Porus. This mound is about six

miles west of the Pabbi range, and has a height

of 50 feet, with a superficial dimension of 600 by

400 feet. Copper coins of all the so-called Indo-

Scythian kings, with the Abundes, were found. While

the siege of Multan (Multtan) still dragged slowly

on, Sher Sinh established himself at Ramnagar,

on the Gujranwala side of the Chenab, 22 miles

below Gujarat, leaving the main body of his army

on the northern bank. Here he awaited the

attack of Lord Gough, who attempted, unsuccess-

fully, to drive him across the river, 22d November

1848, and withdrew with heavy loss; but, sending

round a strong detachment under Sir Joseph

Thackwell by the Wazirabad ferry, he turned the

flank of the enemy, and won the battle of Sadullu-

pur. Sher Sinh retired northward, and took a

strong position between the Jhelum and the Pabbi

Hills. The battle of Chillianwala followed (13th

January 1849). On 6th February, Sher Sinh

again eluded Lord Gough, and marched southward

to make a dash upon Lahore; but the British-Indian

army followed, and on the 22d of February Sher

Sinh turned a guard, and thus his victory was con-

verted into a victory over the Sikhs. The products of the districts are

grain, cotton, opium, safflower, tobacco, indigo,

goor, wool, and ghi. About half the grain is

exported on camels, mules, bullocks, and donkeys,

but chiefly by boats to Pind Dadun Khan, and

from thence by boat to Multan and Sind. Kofti-

gari, or gold-inlaying in iron, is peculiar to Gujarat,

and a very brisk business is carried on by the

workmen. Under former rulers, this inlaid work

was used chiefly in ornamenting weapons, but,

under the peaceful rule of the British Government,

the craftsmen now make principally baskets, trays,

paper-weights, paper-knives, bracelets, and orna-

ments.—Rennell's Memoir, p. 85; Cunningham,

Ancient Geog. of India, p. 179; Imp. Gaz.

GUJERATI, a term applied to a mercantile race

from Ceylon. They are of Rajput origin, and

are principally of the Jain religion. See

Marwari; Gujerat.

GUJ. HIND. Wheat and barley sown together.

GUJ.-PIPAR or Gui-Pipl, according to Dr.

Irvine, is supposed to be the root of Borassus

flabelliformis, brought from Kabil; is astringent,

and is given in medicine to promote digestion;

one seer costs two rupees. According to other

writers it is the sliced dried fruit of Scindapsus

officinalis, Schott.

GUJRA or Sumurrum, bracelets made of col-

oured thread, worn at the Maharani.

GUJARANWALA, a British revenue district in

the Panjub, lying between lat. 31° 32' and 32° 33' N.,

and between long. 73° 11' 50" and 74° 28' 15" E., with an area of 2563 square miles, and a popula-

tion in 1868 of 550,576. The Jats number in all

287,000 persons, or 43.15 per cent. of the

whole population. Farther north, their fellow

tribesmen have almost all become Mahomedans.

GUL. HIND, Pers. A rose, but compounded

with many words to indicate other flowers and

flowering plants. Gulab, rose-water; Gulab-pass,

or Gulab-dan, a rose-water sprinkler; Gulab katu,

or the otto, an essential oil from rose leaves.

Gul, fire-balls for the hookah; a piece of hard

charcoal for lighting the pipe or hookah; also the

cinder or refuse that comes from a hookah, pipe, or

chillum when smoked out.

GULAB SINGH, raja of Jumoom in the time of

Ranjit Singh, was a Dogra Rajput, brother of raj-

Dhan Singh, and raja Suchit Singh. He was cruel,

tyrannical, and exacting, but tolerant in religious

matters. After the Sutlej campaign, the treaty of

Lahore, dated 9th March 1846, left the British

possession of the hill and plain country between

the rivers Beas and Sutlej, and of the hill country

between the Beas and the Indus, including the

provinces of Kashmir and Hazara, and they con-

ferred on Gulab Singh, territories in the hills, and

recognised his independence. He began life as a

horseman in a troop commanded by jemadar

Khashul Singh, then the favourite chamberlain of

Ranjit Singh. He soon raised himself to an inde-

pendent command, in which he distinguished

himself by making prisoner Agur Khan, chief of

Rajouri. For this service the principlship of

Jumoom was conferred on his family. He took

up his residence in Jumoom, and soon extended

his authority over his Rajput neighbours, and

eventually into Ladak. He took an important

part in the negotiations which followed the battle

of Sobraon, and was conducted as the British govern-

ment which ensued broke irretrievably the power

of the Sikhs. The products of the district are

grain, cotton, opium, safflower, tobacco, indigo,

goor, wool, and ghi. About half the grain is

exported on camels, mules, bullocks, and donkeys,

but chiefly by boats to Pind Dadun Khan, and

from thence by boat to Multan and Sind. Kofti-

gari, or gold-inlaying in iron, is peculiar to Gujarat,

and a very brisk business is carried on by the

workmen. Under former rulers, this inlaid work

was used chiefly in ornamenting weapons, but,

under the peaceful rule of the British Government,

the craftsmen now make principally baskets, trays,

paper-weights, paper-knives, bracelets, and orna-

ments.—Rennell's Memoir, p. 85; Cunningham,

Ancient Geog. of India, p. 179; Imp. Gaz.

GULANCHA.

GULANCHA, also Gudanchea. Hind. Root and stem of Cocculus cordifolius. It is intensely bitter. A transverse section is very porous and radiated. A decoction is a valuable bitter tonic and alterative; dose, one ounce flavoured with honey, thrice daily. Is the Panchana preparation of the native physician.—O'Sh.; Beng. Phar. p. 277.

GULBHANGA. Hind. The flower-bearing or female plant of the hemp. Gulbhanga-i-bilishi, a narcotic.

GULKHETUR, a famous field at Tanesur, close to the Grand Truck Road, about 30 miles south of Ambala.

GULIERI. Hind. An iron from Gwalior used for wire-drawing.

GULF OF AKABAH. The Red Sea at its northern end separates into two branches, the Gulf of Suez to the west and the Gulf of Akabah to the east. Akabah is a continuation of the valley of the Dead Sea and the river Jordan. It is a desolate and deserted sea, useless to commerce, and shunned by the native craft on account of the violent northern winds which almost constantly prevail there, raising the sea into a deep and turbulent swell.—Findlay.

GULF OF CAMBAY is about 72 miles long, 80 miles wide at its mouth, and 14 miles at its head. The Nerbudda and the Tapti rivers disembogue into it; and the smaller rivers are the Sabarmati, Myhe, and Dharudar. The mass of alluvial matter brought down by these rivers, and the peculiar motion of the tides, has thrown up many enormous sandbanks; the flood-waves come in the form of a bore. At Perim, 26 miles from the entrance of the gulf, the tidal stream is forced through a space four times less than it occupied before; and again, 27 miles farther north, below the Bore Rocks, it flows into a channel only one-ninth its original width, from which circumstances the velocity of the tide is greatly increased. At the head of the gulf, where it separates into the channels of the Myhe river and the Cambay Creek to the east, and into those of the Sabarmati on the north-east, the accumulated waters of the flood-wave assume the form of a bore, the wave coming in perpendicularly. The eastern or principal bore rises five miles to the W.S.W. of Cambay Creek, and is not perceptible in the deep tides, unless the previous springs have been unusually high, when it may be observed slightly through the quarter. It generally commences when the winds begin to lift, the waves increasing daily in height as the tides gain strength, and it is at its greatest height about two days after new and full moon. It also varies with the night and day tide, which differ in height six or eight feet, the night tide both of new and full moon being the highest; as the highest tide must have the greatest velocity, so the wave of the bore will be highest with the greatest tide. At about 14 miles below Cambay, the high springs were found to rise 33 feet. And the flood runs at six miles and the ebb at seven miles an hour. The bore first shows itself in the channel at eight miles below Cambay, as a wave 3½ feet high, with a rate of seven knots. In the first hour the water rose six feet during the first ten minutes. Above Cambay the wave breaks in seven feet high, with a velocity of ten knots. The western bore, running into the Sabarmati river, is almost precisely similar to the eastern bore, but it washes away by its force very large portions of the shore and adjoining sandbanks. In places where the force of the wave is directed to one point, it frequently flows quite perpendicularly, having the appearance of a wall, when it curls and breaks with a thundering roar. In the centre of the channel in the main line of the rush of the bore there is less danger than near the shore, where the wave curls along the banks.—Findlay.

GULF OF CUTCH is an extensive inlet of the Arabian Sea, running eastward 90 or 100 miles, and separating Cutch from Kattiyawar, and terminating at its head like the Kori, in the flat desert of the Rann. At its mouth, between Dwarkas and the Cutch coast, it is 30 miles broad.—Findlay.

GULF OF MANAAR lies between Ceylon and the Peninsula of India, and has a width of 130 miles, extending to the line of islands and banks separating it from Palk's Straits, and a breadth of 200 miles from Point de Galle to Cape Comorin. In the 19th century the British deepened it, to admit ships of greater draught.—Findlay.

GULF OF MARTABAN is the north-east angle formed by the delta of the Irrawadi and the Martaban, Amherst, and Tenasserim coasts. Between Baragu point and Klangouk island it is 130 miles wide, and recedes to the banks of the Sitang river.—Findlay.

GULF OF OMAN is the funnel-shaped entrance to the Persian Gulf, included between the province of Oman and the opposite coast of Makran. The south coast of the Gulf of Oman, from the Ruweis-ul-Jabal nearly to Muscat, is fertile and well covered with date trees. It extends in a wide plain to the foot of the mountains, and increases in breadth from 29 miles at Cape Musendom to 110 miles at its eastern end. From Muscat to Musendom it is 200 miles in length, and within these limits its area is 14,000 square miles. The coast on the Persian side is mountainous, with deep water close to it; but the Arabian coast, excepting the Ruweis-ul-Jabal mountains, is low, fronted by reefs and shoals at a great distance from the shore for nearly its whole length, forming the celebrated pearl banks.

GULF OF PEH-CHI-LI, on the E. coast of China, is at the mouth of the Pei-ho river, and is separated from the Yellow Sea by the Mian-tau group of rocks. The shore is low and flat. GULF OF PERSIA, or Khali-ul-Fars, is the large inland sea bounded on the N.E. by Persia and on the S. by Arabia. The Persian Gulf, from the coast of Oman to the Basra river, is 450 miles. Inside its breadth varies from 100 to 180 miles, but at its entrance at the narrowest part it is only 29 miles. Within a line drawn due east from Ras Musendom, it comprises an area of nearly 70,000 square miles. The northern or Persian side presents in its whole extent, from the delta of the Euphrates to the Makran coast, a series of rugged precipitous mountain ranges, one behind the other, running nearly parallel to the coast and to each other, and increasing in height as they recede from the sea. A belt of low land of varying width runs between the mountains and the sea, called by the Persians the Garm-sair, hot and unininviting, with a few date groves. The small seaport towns are occupied by Arabs. The southern coast, from the mouth of the Euphrates (Shat-ul-Arab) to the Ruweis-ul-Jabal, is generally of white sand, a perfect desert, with extensive uninhabited tracts. Water scarce and bad, though there are date

There are two leading modifications of gum, one of which is represented by gum-arabic, and the other by gum-tragacanth. There are many intermediate varieties, amongst which cherry-tree gum may be distinguished; and the different kinds of gums have been classed under the generic terms of arable, tragacanthine, and cerasine.

Gum-arabic, gum of the cherry, gum-tragacanth, and others, flow spontaneously from the branches and trunks of the trees producing them. The gummy matter resides in the bark and albumen; it is the nutritive juice of the plant. But as the wood absorbs more moisture from the air than the bark, and hence swells more, in consequence of its enlargement it distends the bark, which by the internal pressure of the wood gives way, and gummy matter escapes.

Artificial Gum.—In the process of calico-printing and for stiffening different goods, an artificially prepared gum has for some years been employed. Starch or curculio is, by the action of diastase—a peculiar azotised substance formed during the germination of seeds—converted into a gummy mucilaginous substance named dextrine. It is known in commerce under the name of British gum and torrefied starch. The term leucoem has been applied by Payen to a modified dextrine, whiter and more soluble than can be obtained by torrefaction. It is formed by moistening 1000 parts of dry starch (potato starch is generally used) with very dilute nitric acid, consisting of 2 parts of concentrated acid and 300 of water. The mixture is divided into small blocks, which, when dried in the air, are rubbed down, and exposed in a proper drying stove to a current of air heated to about 150° or 160°; the powder is afterwirds well dried at a temperature not exceeding 230°. When well made, it dissolves in cold or tepid water as easily as gum-arabic.

Gum-Arabic.

Gum-arabic is the produce of species of Acacia growing in Arabia, India, Upper Egypt, Senegal, etc. Acacia seyal, A. Ehrenbergii, A. tortilis, A. vera of Africa, all yield the gum-arabic of commerce. That known in commerce as the finer gum Senegal is said to be the produce of A. vera. A. albidus (the A. Senegal of Willde.), A. seyal, and A. Arabica also yield it, and the inferior reddish varieties from A. Adansoni. Barbary gum is said to be the produce of A. gumnifera.

Gum Senegal is exported from Portendic, Sierra Leone, and the French settlements on the Senegal, being produced chiefly in the desert country to the north of the Senegal. A. vera is stated by the authors of the Fl. de Senegambia to yield the pale and fine varieties, A. albidus (A. Senegal, Willde.), and A. Adansoni the inferior reddish varieties. A. seyal, A. vera, and A. Arabica are found in Senegambia.

Barbary Gum is exported from Mogador on the west coast of Africa. It is of inferior quality, and, moreover, a mixture of two or three kinds.

The East India Gum of commerce is the produce of A. Arabica, A. sericata, Aegle maramelos, Feronia elephantum, Azadirachta Indica, Melia azedarach, Odina wodleri, and Prosopis spicigera. It is known as Gond, Babul gond, and Ghati gond. It occurs in rounded pieces or tears, and in fragments, up to the size of a walnut or larger. It dissolves almost completely in water. The solution is purer when made with cold water, and keeps better.

East India Gum is exported to Europe chiefly from Bombay, having been previously conveyed there from the coast of Arabia, and is largely of African origin. Some is also exported from Calcutta and Bombay by the names of Babul and
GUM.

Ghatti gum, and is of good quality, but is yielded also by Acacia serissa, and by species of other genera.

A gum is also obtained at the Cape from the Acacia karroo, A. horrida, and A. giraffe, and from the A. decurrens of New Holland.

According to the locality producing it, gum-arabic is known as Turkey or Arabic gum, Barbary or Morocco gum, Senegal, East India, and Cape gum. The mucilage of each of these varieties of gum is employed to give lustre to crapes and silks, and for cementing into cakes the various pigments used by artists in water colours.

Cherry-tree Gum, including that of peach and apricot trees and other species of Prunus, resin is obtained in inferior gum-arabic in its external characters, but is only partially soluble in cold water.

Mastic Resin is produced in Scio from the Pistacia lentiscus, the lentish tree. That which collects on the branches of the trees is called mastic in the tear, and fetches the highest price, while that which falls to the ground constitutes the common mastic. Mastic varnish is well known from its transparency, and its peculiar toughness and tenacity even when spread in the thinnest coat on wood or on canvas. This is due to the presence of a peculiar resin, which does not possess any acid properties.

Olibanum was the frankincense used by the ancients in their religious ceremonies. Moses speaks of it in Exodus; and it long formed a constituent in the preparation of incense. It is produced in India from the Boswellia thurifera, but there are also African and Arabian varieties.

Myrrh—This gum-resin was an object of trade more than 3500 years ago. It is produced in various parts of Asia and Africa, one myrrh tree bearing the scientific name of Balsamodendron myrrha. Turkey myrrh is considered the finest, the East Indian being the second in quality. It is employed medicinally as a dentrifrice, and in the preparation of fumigating pastilles.

Tragacanth is gathered in Crete from the Astragalus tragacantha. It is largely employed in calico printing, and has many uses in the arts.

Catechu is an extract rather than a gum, obtained from the Acacia catechu.

Gambier has similar properties to catechu. It is obtained from the Uncaria gambier, and both of these are employed in calico printing, dyeing, etc.

Gum Kino of commerce is obtained from the Sterculia cinerea and P. marsupium, and Eucalyptus resinifera. It is used in medicine, and has been proposed to be employed in the arts. The dragon’s blood is from P. draco.

Gamboge is obtained in Ceylon, Malabar, Siam, from species of Garcinia. It is much used as a pigment, and in miniature painting it is employed to colour varnishes and lacquers.

Elemi gum-resin is the product of a tree still undetermined, and although it is of considerable importance, and is imported in large quantities, the locality producing it is not distinctly known. It forms an essential ingredient in many of the finest varnishes.

Copal resin exudes spontaneously from two trees, Rhus copallinum, and Elaeocarpus copalifer, the first being an American and West Indian, and the second an East Indian tree. A variety of copal is obtained from the coasts of Guinea. The American kind comes to Britain in flat fragments, the East Indian in roundish masses, and the latter furnishes the finest varnishes. Fresh essence of turpentine dissolves it completely, but old turpentine will not do so. It is stated that essence of turpentine, digested upon sulphur, will dissolve double its own weight without letting any fall. The oil of rosemary also dissolves copal with great readiness. An excellent varnish may be made by dissolving one part of copal and one of essence of rosemary, with from two to three parts of pure alcohol.

The employment of the gums and resins in the arts has been greatly facilitated by the discovery of new solvents, such as the new alcohols and ethers, naphtha, benzole, chloroform, and others.

Gum-ammomiacum.

Ushek, Feshah, Agan, Sanough b’ sherin, Pera.

This is a bitter, nauseous, bad-smelling gum-resin, and used in medicine. Dorema ammoniacum, Ferula ammonifera, Fex, F. orientalis, and F. Persica, have all been named as its source.

Gum-anime is a gum-resin the product of the Hymenaea courbaril, the courbaril locust tree of South America, introduced into Tenasserim, and easily propagated. This gum-resin is of a pale brownish colour, and is met with in commerce partly in translucent and somewhatunctuous grains or tears, and partly in large brittle masses. But the commercial article is doubtless the product also of the Vateria Indica or gum-copal tree, which yields almost a precisely similar resin. For ordinary purposes these may be used indifferently, but where purity is demanded, copal is almost insoluble, while anime is wholly soluble in alcohol.

Dekamallee is the gum of Gardenia lucida; it exudes in amber-coloured transparent drops at the ends of young shoots, from which it is collected. It is a strong, disagreeable-smelling gum-resin, procurable in most Indian bazaars, and much used by native physicians as an external application, when dissolved in spirits, for cleaning foul ulcers. It is also used by some European practitioners in cases of worms in children. It is most useful in preventing vermin breeding in wounds, keeping away flies from sores, on account of its strong aroma; and it is an article in the materia medica of the village farrier. Its effect in preventing the access of flies to festering wounds and running sores is remarkable.

Dammer is a vernacular term for the resins of various trees growing in India and in the Eastern Archipelago. In Bombay the term Dammer is also applied to pitch. Throughout India, Bal and Rala are terms applied to all resinous substances; but the Bal of Northern India, and exported from the Punjab, is not similar to that of the resins of Vatica robusta and of V. tumbaga, which form the chief part of the dammers of India. These are very brittle, and are amber-coloured.

Sal-tree Dammer is the resin of V. robusta and of other species. It occurs in sticks much resembling in shape the black dammer, but differing widely in colour and consistency. In colour it varies from a light yellow to a dark brown, the two colours being very frequently found in the same lump, and giving it the appearance of having a regular ‘grain.’ It is friable, and differs from the white dammer of the western coast in its inferior hardness, opacity, and its peculiar form.
GUM.

and from the black dammar in its colour. There are extensive tracts of Gigulun (Vatican) jungles in the Gumur and Cuttack provinces. The Khond and Uria races living in and near these jungles, wound trees in several places, the resin issues, and is collected when sufficiently solid. The dammer collected from the decayed parts of the tree is of a dark colour.

Piney Resin of the Vaterra Indica is amber-coloured and very tough. It is known as Piney dammer, white dammer of Malabar, Indian copal, and Indian gum-anime. This resin when soft is Piney varnish. It is largely exported from the forests of Travancore and Western Ghats.

Black Dammer of Malabar is the product of Canarium strictum.

White Dammer of Singapore occurs in fragments of variable size, marked with reddish streaks, transparent, amber-like, brittle, with brilliant fracture, very inflammable, inodorous, and tasteless. This resin flows from the Damurra orientations which grows on the lofty mountains of Amboyna. It hangs from the branches, and resembles stalactites, the pieces being sometimes as large as the hand, and 4 to 8 inches long; some pieces are like anime resin. This substance, in contact with wood-oil, makes a useful coarse varnish for doors and windows. It is also sometimes employed as a pitch in dockyards, and by mariners in the preparation of certain plasters. When melted with gingelly oil, it is used for covering corks in bottles.

Coedie or Kurrie Gum, called also Australian dammer of New Zealand, is the product of Dammar Australis.

The dammer of the Tenasserim Provinces is the product of three different genera, belonging to the wood-oil tree family,—the Vatica, the Hopea, and the Dipterocarpus.

Gum Elemi of commerce is said to be yielded by several species of Amyris.

Brazilian Elemi is called also Aouaceli balsam. It is obtained from the Icena heterophylla.

American Elemi comes from Icena iciecarba; resin of courina from I. ambrosia.

Gum Galbanum is referred to Ophoidia galbanifera, Don, Galbanum officinale, Don, and Female galbanum, Don. There appear to be two kinds of galbanum, Levant and Persia. The Persian, which is the one which comes to commerce, is yielded by Ophoidia galbanifera.

Gum-eleastic, caoutchouc, or India rubber, is obtained in S.E. Asia from several milky-juiced plants, belonging to different families (Sapotaceae, Apocynaceae, Moraceae, and Euphorbiaceae). Assam in particular furnishes large quantities of India rubber from Ficus elastica; whilst supplies from Labuan are of the Urceola elastica; and from the Peninsula, of Cryptostegia grandiflora.

Isodonra gutta yields the famous guuta-percha of commerce, which, like India rubber and caoutchouc, rapidly rose in demand after its first discovery, and merchants anxiously look for new sources of supply.

Gum Sagapennum, believed to be the produce of an amphiher of Western Asia, perhaps Perula Persica, Wil. (Sagapenna, Wil. Fl.)

The Turpentine are oleo-resins obtained from coniferous plants. Pinus palustris and P. teda yield turpentine, Canada turpentine, or Canada balsam, is from the Abies balsamea. Spirits of turpentine is obtained by distilling the crude turpentine. Camphene is the rectified spirit. Turpentine is extensively employed as the solvent of the other resinous bodies in the formation of varnishes. Its solvent powers in this respect render it exceedingly valuable to the artist, and also to the manufacturer. The rectified oil of turpentine has been much used to a solvent of caoutchouc. It has been stated by Bouchard that the unrectified oil dissolved India rubber with great difficulty, whereas the oil rectified without water was an excellent solvent, but that it was rendered still better when it was distilled from bricks.

Scio Turpentine, called also Chian and Cyprus turpentine, is the product of a Pistacia in the island of Scio. It is obtained by cutting crossways with a hatchet the trunks of the largest trees; the turpentine runs down on flat stones placed to receive it, each tree yielding about eight or ten ounces.

The Oleo-resins or wood-oils, the Gurjun oils of the genus Dipterocarpus, also the black varnish from the genus Melanorrhoea usitata, are all largely used in the arts and manufactures of S.E. Asia.

The export of gums from India during the ten years 1871-72 to 1880-81, ranged in value from £147,336 in 1871-72 to £332,393 in 1880-81. During the last ten years, 1881-82, produced, 323,393 cwts., valued at £294,685. In the eleven years 1850-51 to 1860-61, gum-lac, etc., the value of from £78,642 to £171,646 was exported, nearly all from Bengal. From 1872 to 1881, the value of its exports ranged from £208,680 in 1873, to £755,745 in 1876.—Ainslie; Crawford; McClennan's Tenasserim; Pereira; Royd; Prod. Res.; Eng. Cyl.; Hamilton's Senai, Hedjaz, p. 278; Rozh.; Morrison, Comp. Descr.; Mason; O.Sh.; Faulkner; Vegetable Kingdom; Poole; Drury's Useful Plants; Birdwood's Bombay Products; Porcell.

GUMADI. Tel. Gummar. HIND. Species of Gmelina, G. arborea, G. parviflora; Tella gumadi is G. Asiatica. Tagumadi, Gmelina parviflora, is a large timber tree, a native of the mountainous parts of India. The wood of such trees as will square into logs from 18 to 24 inches, resembles teak. The colour is almost exactly the same, the grain a little closer; at the same time it is as light or lighter, and is as easily worked. It is used for the decks of pinnaces about Chittagong, Dacca, etc., and is found to stand the weather without shrinking or warping, better than any other wood known there. It seems to be the Gm. Asiatica. Gm. arborea has a light-coloured wood, close-grained and light, grows in the Santal jungles, but scarce. It is used for planks, and in constructional palkies. It is this wood with which the beautiful lac ornaments are made, such as workboxes, envelope cases, pen-trays, etc., for which Suri is celebrated.—Cal. Engineers Journal, July 1860; Rohde, MSS.; Rozh.

GUMATTI. HIND. Mines in Mandi, Kangra Hills, etc., a dirty-grey rock-salt is obtained.

GUMBAZ. HIND. A dome, a mausoleum. The gumbaz covering the tombs of the Adal Shahi kings at Bijapur and Gogi are of magnificent dimensions, and in good preservation. Those at Kulburga and other places have, however, been dismantled. Those at Golkonda, near Hyderabad, and the Dekhan, over the Kutub Shahi kings, are in good order, though of small dimensions. Those over
the Imad Shahi of Berar are remarkable. Over the Barid Shahi of Beder there are large gumbaz, but mostly in ruins; and those at Roza, between Dowlatabad and Ellora, are small and mean in appearance, though the emperor Aurangzeb, who died at Ahmadnagar, is buried there.

GUM DRAGON TREE. of the Canary Islands, the Dracaena draco, affords a concrete, astringent, resinous juice, called dragon's blood. A tree growing at Orotava, in Teneriffe, attained much celebrity. Its hollow trunk had been used from time immemorial by the Guanches for their religious rites. The approximate circumference of the trunk in 1867 was about 78 feet, its height not exceeding 75 feet. It was greatly injured, if not destroyed, by a gale in the autumn of 1867. The gum dragon is a name of tragananth.

GUMGHATTY, in Bombay, is a commercial term for mixed gums from forest trees, from species of Acaea called Baba, the wood- apple tree, Feronia elephantum, the mango tree, the nim or margosa trees, species of Melia and Azadirachta, the Vachellia farnesiana, the Moringa pterygosperma, and the cotton trees, Cochlospermum gossypium; picked pieces are sold as gum-arabic.

GUMKA. Hind. Slight fermentation of ears of corn, induced to facilitate threshing.—W.

GUMP KAMLU or Kamawaru. Tel. A Sudra caste in Southern India, who do not permit any stranger to enter their houses.

GUMSUR, a hill tract lying between lat. 29° 40' and 20° 25' N., and long. 80° 10' and 85° 5' E., in the neighbourhood of Ganjam and Vizagapatam. For a long period after British occupation of the Peninsula, the zamundar held the Gumsur country on payment of rent. The native Chief in 1855 claimed exemption from civil process, also refused to pay arrears of revenue, and the territory was annexed by the British. In 1871 the population of Gumsur was 158,061. It is now a taluk of Ganjam.

GUMTI, a tributary to the Ganges. It rises in a small lake or morass 19 miles east of the town of Pilibhit, in lat. 28° 33', long. 80° 10', 520 feet above the sea. It runs S.S.E. into the Ganges, joining 30 miles below Benares, after a course of 482 miles. In the rainy season boats of 4000 or 4200 mounds burden are sometimes seen proceeding down the river to Lucknow. It runs near Lucknow, Juaopore, Sydpur, and near Chongong in Comillah.

GUM TREES of Australia are of several genera. The grass gum trees, Xanthorrhoea, sp., and Kingia Australis, R. Br., plants of Australia, bear some outward resemblance to each other, but belong respectively to the lily and the rush families. The blue gum tree of Tasmania (Eucalyptus globulus) and its ally E. corynocalyx of South Australia, and other species; also Cordyline congesta, Moreton Bay; Seaforthia elegans, Damnara robusta, of Queensland.

GUN. Several of the old cannon in the Peninsula of India are of great size. That with the largest diameter is at Bijapur. It was cast at Ahmadnagar about a.d. 1549, by a supposed native of Constantinople, named Rumi Khan, also Husain Khan, and the bed of its foundry was still unlevelled in a.d. 1839; it was close to Rumi Khan's mausoleum, which had been converted into a dwelling-house. The gun was dragged to Bijapur by means of elephants and bullocks. Rumi Khan was the Mir-atish, or commandant of artillery, under the Nizam Shah Bhaier dynasty of Ahmadnagar. The length of this gun is 15 feet, and calibre is 2 feet 4 inches, and a full-grown man can creep into it. It remains on a bastion of Bijapur, and Hindus have besmeared it with red-lead and worship it. Another gun may be seen not far off, on the summit of the high tower called the Oopuri Boorj, measuring 30 feet in length, and composed of bars of iron welded or rather bound together. The legend current regarding the Oopuri Boorj is that one of the kings, wishing to get his city fortified with as little expense to himself as possible, gave each of his nobles a certain portion of wall and rampart to build, and excited the greatest emulation among them as to whose work should be best done. One of the chief nobles was absent at this time, and on his return found the city completely walled in, and his peers rejoicing in their patriotic endeavours. Stung at being excluded from such a grand work, he expostulated with the king, who, to comfort him, promised him that he should build one that would surpass in height and splendour the work of the others. Hence this bastion. A built gun 27 feet long is now lying on the top of Gawilgarh Hill, and one 21 feet long was on the walls of Beder in 1869.

GUNA. Sansk. Merit, virtue; a property, a quality, of which, metaphysically, three are principal.

Sativa guna, the property of truth, purity, and wisdom.

Raja guna, the property of foulness, the source of passion and error.

Tama guna, the property of darkness, the source of inertness and ignorance.

Nir guna, deity abstractedly, without any of the three properties.—Wilson.

GUNA-DOSHA. MALEAL. From Guna, good; Dosham, bad. A form of marriage amongst the Nair people; the words mean for better or worse. See Polanydrty, p. 109.

GUNCH. Hind. Roots of Abrus precatorius, a substitute for liquorice root. The seeds are used as weights by jewellers, also for necklaces, bracelets, and other trinkets. They are of various colours, red, and red and black, and almost wholly black.—Cymbdis Diet.

GUND, a plateau in N. Cainta near Dandiili. It has a considerable forest tract, and near Dandiili is a Negro race. There is a succession of small rapids, amounting to a fall of 120 feet, in the Black River, but the timber can be floated downstream, though not without some difficulty.—Cleg.

GUNDA, four of anything. Like the Duna, the Gunda of accounts and the Gunda of practice do not coincide. See Ganda.

GUNDA BAROSA. Hind. Boswellia thurifera resin.

GUNDAL. Sansk. Tel. Cyperus hexastachys, Rott. Wight says the true name is Gunda, a fragrant grass; also a plant bearing a fragrant seed, which, with the addition of La, 'what eats,' becomes Gundala, a name of the Chakor or Perdic Chakor, Gray, which is said to eat the seeds above mentioned.—Elliot, Fl. Anher.

GUNDURGH, This mountain, prior to British supremacy, was a stronghold of banditti, who infested the high road passing through Husan Abdal to Peshawur. At the foot of one of its northern spur, opposite to Hurripur, is the
GUNONG.

GUNONG API.

GUNONGAPE.

strong village of Murree, where the Sikhs were several times repulsed by the mountaineers, and where Major Abbott found an asylum during an inundation.—Rec. Gov. of India, No. 11.

GUNDICOTA, a town and fortress in lat. 14° 51′ N. and long. 75° 22′ E., between Gooty and Cuddapah. It is on the summit of a precipice, forming the southern wall of a fissure that cleaves a range of sandstone hills from their summit to their base, and the Pennar river passes through the gap into the plains of Cuddapah. The district was ceded to the British by the Nizam in A.D. 1800.

GUNAGHAR. SANSK. From Gunga, and Dhara, to hold. Gunaghara-Shastri, he who knows the Shasta is called a Shastri.

GUNAPUTR or Gangapootr, a tribe of inferior Brahmanas (literally sons of the Gandes), found chiefly in Benares, Bithur, and Sheorapur in Cawnpur.—Elliot.

GUNAGULLY, a river of the plain of Dharwar, rises in lat. 15° 45′ N., long. 75° 10′ E., and runs S.S.W. into the Indian Ocean; length, 100 miles.

GUNAGULLY and Sadashewghur are shipping ports on the W. coast of India. Gunagulli was at one time the chief place of export for the metals, timber, etc., its position nearest to the Mogadda jungle above, and to the south of the Arbyle Ghat.—Gibson's Bombay Forest Report.

GUNGHILU, little bells fastened to a string, which is wound round the wrists and ankles, and which jingle at every motion of the limbs.

GUNKARI. HIND. Pewter anklets of Kulu.

GUN-METAL.

Stuck-goed. DUT. Metallum tormentorum, Stuckgurt. GER. Metallum tormentorum, Bronze. IT. Metal de canones, SP.

It is used for casting statues, cannon, bells, frames, stands for argand lamps, ornaments, etc. Bronze is an alloy of copper and tin, the quantity of tin employed varying according to the effect desired to be produced. Analysis has shown that ancient weapons and tools contained 8 to 15 per cent. of tin, medals from 8 to 12 per cent. tin, with 2 parts zinc added to each 100, for improving the bronze colour. The modern alloys of copper and tin, which are now produced in large quantities, are made up of a variety of metals bearing different names, as soft gum-metal, brass ordnance metal, with 8 to 12 per cent. tin, the various bell-metals, and the Chinese gong with 20 per cent. of tin, and speculum metal of 126-4 per cent. of copper with 58-9 of tin.—Tomlinson. See Alloys.

GUNNEIRA SCABRA, used for tarts, like the stalks of a species of rhubarb.

GUNNY.

Guni, BENG. | Koni, TAM. Gunpat, Gunipat, HIND. | Gona, Tel.

A strong, coarse sackcloth manufactured largely in Bengal, for making into bags, sacks, and packing generally. The material from which this is manufactured is the fibre of two plants, Corchorus olitorius and C. capsularis, both of which, but particularly the former, are extensively cultivated throughout Lower Bengal. Besides a large domestic consumption of gunny, the whole rice, paddy, wheat, sugar, salt, pepper, coffee, and other foreign produce, are exported in gunny bags or sacks. The kind of cloth of which the gunny bags are made is called in Bengal Chata, in Tamil Koni, and in Tel. Goni, also Tat. It is of three different kinds, and was formerly woven in pieces from three-quarters to one cubit wide, of which two or three were sewn together at the sides, into one piece, before offering it for sale. The first kind, intended for bedding, is 4 to 6 cubits long and from 2 to 3 cubits wide, and sells at about 8 rupees per 100 pieces. Secondly, that intended for covering bales of cloth is of the same dimensions, but is thicker than the former kind, and costs from 6 to 10 rupees per 100 pieces. Thirdly, that intended for making rice and sugar bags is 5 cubits long and 1½ or 1½ cubits wide, and ten bags cost 4 or 5 rupees. The exports from British India of gunny bags and gunnies have vastly increased. From 1850 to 1882 they were of the following value:

1850-51. £118,421 1856-57. £376,253
1851-52. 290,790 1857-58. 217,062
1852-53. 201,667 1858-59. 392,424
1853-54. 174,926 1859-60. 333,977
1854-55. 215,346 1860-61. 230,043
1855-56. 302,340 1851-52. 1,067,588

Gunny Bags exported from India.

1874-75. No. 8,010,824 Rs. 23,307,523
1875-76. 19,523,250 44,25,003
1876-77. 32,890,545 64,64,808
1877-78. 26,406,539 72,96,686
1878-79. 29,587,010 72,96,686
1879-80. 55,902,481 1,13,20,504

Gunny Cloths exported from India.

1874-75. Rs. 20,271
1875-76. 4,47,542
1876-77. 6,94,643
1877-78. 3,56,100
1878-79. 5,26,446
1879-80. 6,08,188

Gunny Rope and Twine exported from India.

Cwt. Rs.
1874-75. 5,000 24,404 1877-78. 4,428 54,431
1875-76. 1,362,44,632 1878-79. 2,768 23,286
1876-77. 4,555,34,759 1879-80. 2,063 16,754

GUNNYGULL, a hill ridge south of Kurnool, which is seamed with great veins of pure specular iron ore. See Iron.

GUNONG API. MALAY. Literally, fire mountain.

There are three volcanoes in the Eastern Archipelago of this name,—one within the circle of the Banda Islands, which is a conical active volcano 2900 ft. high; the second one, which is the most northern, is 1000 ft. high, and the third is near the W. end of Sumbawa, at the northern entrance to the Siphi Strait. Gunong Api, north of Wettas, rises six or seven thousand feet above the sea. It is an uninhabited volcano, and is a great landmark for ships trading with China, who pass up the Ombay passage and come down the Flores Sea. Nila is an active volcano 1700 feet high, in the E. Archipelago. It is E. of the Gunong Api that lies north of Wettas. In 1694 a great eruption occurred, part of the crater fell in, the whole island was a sea of lava, and the people fled to Banda; and a similar eruption occurred in September 1824, when all similarly fled.

Gunong Api of the Banda group is called by the French the grenade of Banda. It is a single island or cone of volcanic matter rising from a rocky base, and separated from Greater Banda by a narrow channel. Since the Banda Islands were discovered, there have been at least 13 great eruptions of this volcano. That of 1820 was very severe; and another occurred in 1824. The strongest eruptions were in the following years:

1598, 1615, 1632, 1691, 1711, 1749, 1798, 1820. That of 1691 was a terrible one. The most fatal earthquakes took place in 1629, 1683,
GUNPOWDER.

1866, 1743, and 1816. Its height is about 2000 feet. It is covered with magnificent vegetation, commencing at the line where the waves cease to beat, and continuing upwards to the point where the lava ceases to flow, being cooled by the air. This volcano is the curse of the group. The nutmeg is not cultivated, and the island is occupied by a few emigrants from Timor.

Gunong Bermen is a lofty mountain 100 miles north of the Lautman group of the Malay Peninsula. The upper part of the rivers and many of their feeders are occupied by five tribes of aborigines, viz., the Uday or Senang, who appear to be the same people who are known to the Binna of Johore under the name of Orang Pago, are found on the Seganet, Palungan, and Kapi, tributaries of the Muar, and in the vicinity of Gunong Ledang. The Uday or Senang have not any other weapons than the muspitan. This is the most savage of the aboriginal tribes that roam the mountains and forests in the centre of the Malay Peninsula, and upon the borders of the Malacca territory.

The Jakun partially frequent the same territory, the lower part of Palungan, Gampam, etc., and extend N. and N.W. within the British boundaries. They are found at Tidong, Ayer Chirimin, Ayer Itam, Durut Yassin, Ulo Kissang, and Pakit Singer. Many, the largest tribe, dwell around Gunong Bermen and the adjacent mountains. G. Risam, Lieila, Singwang, Kamuning, Kaya Libet, and G. Garus possess the higher part of both the western and eastern streams.

The Sakai succeed to them in the interior, frequenting the neighbourhood of Gunong Kinabalu.

On the N.W. the Mentira march with the Besi, one of the most numerous tribes, who occupy all the streams flowing in that direction from Gunong Bermen and the mountains lying to the southward of it.

These five tribes (as well as those inhabiting all the interior of the Peninsula to the north) are sometimes by the Malays called Orang Binua.

Another group are the Bermen tribes, so called from the circumstance of most of the streams on which they are found rising in the Bermen mountain system, receiving accessories from it, or joining rivers which have their source in its ravines.

Gunong Bedong, in the Natunas Islands in the China Seas, in lat. 4° 3' N., also called Quon Hill. Another mountain in the Natunas is called Gunong Ranay.

Gunong Geeth, or the Blue Mountains, a high range in Java, about 30 miles inland from Batavia. Pangeango rises 9954 feet, Salak 7322 feet, and Kaurang 6014 feet above the sea.

Gunong Gedong, about 7000 feet high, is about 30 miles E. by N. 3/4 N. from Malacca, and is also called Queen's Mount, also Mount Ophir.

Gunong Geral, also called Quedah Peak, is the highest hill on the Quedah main. Its summit is estimated at 6000 feet above the level of the sea.

Gunong Mar-epi, a sulphurous mountain in Java, 2000 feet high.—Bikorasa; Horbsburg.

GUNPOWDER.

GUNTA BARINGA.

Gunpowder is a compound of sulphur, charcoal, and nitre. The sulphur and charcoal in a state of fine powder are mixed with the saltpetre moist as it comes from the refinery. This compound, known as green charge, is long and carefully ground under iron and stone runners. This green charge is then milled into gunpowder under large iron runners, that used for Esfeld or Snider for petits, this being done for the space of two hours. It leaves the mill in a state partly of soft cake or mill cake, and partly of dust. These are then pressed into a hard cake at the rate of 70 tons on the square foot, and by the corning and granulating processes it is broken up into the grain, dried and glazed to the form in which it is sold as gunpowder.

The gunpowder made in Madras is sun-dried on a black drying terrace, on which, in 1854, the temperature ranged as under at noon:—

Jan., 130°—156° | May, 130°—154° | Sept., 130°—154°
Feb., 130°—156 | June, 132°—156 | Oct., 135°—150
March, 130°—154 | July, 150°—156 | Nov., 138°—146
April, 130°—156 | Aug., 129°—150 | Dec., 130°—150

Sir John Davies is of opinion that the art of printing, the composition of gunpowder, and the magnetic compass had their first origin in China. Gunpowder was known in England in A.D. 1390. A discovery of Angendre, which Dr. Pohl turned his attention to, is an explosive mixture of 28 parts of prussiate of potash, 23 of cane sugar, and 49 of chloride of potash. This mixture is white, and may be used as gunpowder; it is lighter than common gunpowder, but its strength is greater in the ratio of 167 to 100 for an equal weight of each, and in the ratio of 129 to 100 for equal volumes. Hence only 60 grammes of white powder are necessary to produce the effect of 100 grammes of black, which, moreover, leaves a residue of 68 grammes, while the former only leaves 31 1/2 grammes. White gunpowder has further the advantage of not heating the gun so fast as the other, because the temperature of its flame is much lower. It is easier to manufacture, less hygroscopic, less inflammable by percussion, and more economical than black gunpowder. In India the charcoal used for making gunpowder is made from the stalks of the Cuminum indica. In China it is made from the Cunninghamia excelsa and C. excelis. Gunpowder Play is the Laut-ul Barut, firing matchlocks in the air in the East to rejoice.—Davies' China.

GUNT. HIND. Rent-free lands.
GUNT. HIND. A hill honey or Tartar honey.
GUNTA. HIND. A small tank or small pond.
GUNTA BARINGA. Tel.

Bhiu jamb, BEN. Sirri-teku. SINGH. Gunt baranghi, DUKH. Chirru-dakki. TAM. Barunghi, SANSK. Ghantu bharangha, TEL. Bhooni jombuka, TEL.

Gunta baringa is the root of a plant growing in the hills about Lamsingi to the W. of Visagapatam. It is mentioned by Ainslie (p. 112, 1st ed. 1804) under its Tamil name Chippalekky. It grows in Southern India by native practitioners as a febrifuge. Aimsie says it is a small, knobby, somewhat warm, and slightly bitterish-tasted root, which the natives prescribe in fever and catarrh. The Vytteens consider an infusion or decoction of the leaves and tender shoots of this plant as attendant and diaphoretic. They are said to be slightly bitter and not unpleasant to the taste. Mr. W.
GUNTER.

Ferguson of Colombo is of opinion that Premna herbacea, Roxb., is the plant that produces the Gunta baringa.—Elliott, Flora. And.; M. J. R.; Ind. Ann.; Med. Sci., 1856.

GUNTER, Dr. A., a learned naturalist. In 1860, Lieut.-Colonel Playfair and Dr. A. Gunter published a work on the fishes of Zanzibar. Dr. Gunter, in addition to all that he had written in the proceedings of the Zoological Society and other journals in the years 1860 to 1898, brought out seven volumes of a Catalogue of the Fishes in the British Museum.

GUNTUR, a town in lat. 16° 12' N., and long. 80° 20' E., which gives its name to a revenue district of the Madras Presidency. A body tract of 1000 square miles is known as the Pahad, but an extensive plain surrounds the Condaived range of hills, rising 1725 feet above the sea. The Innaconda hills rise 1920 feet above the sea. Bellumconda, 35 miles N.W. of Gunter, is a conspicuous hill on which, as also on the Condaived hills, are remains of fortresses. The town of Khodinipuram, at the foot of Condaived, is a place of much sanctity. Arzampatam and Cotta-pallam are seaports. A raised beach extends from N. to S. from Chhina Ganjam towards the Kistna, and a tradition says the sea once reached that spot, near the town of Chhina Ganjam, and that Europeans traded, in a.d. 1224, to the town of Franguloddn, now in ruins. Earthquakes are of frequent occurrence. The Kistna river winds round the Pahad, and at Bezawara it has been dammed by an ancient 3750 feet long, to irrigate 1,000,000 acres in this and the Masulipatam district. Several marine lagoons run along the coast. The Buddhist temple of Amarnath on the Kistna is in ruins. Compact crystalline limestones occur. Gunter was thirteen years subject to British authority previous to the possession of the remaining four districts of the Northern Circars, viz. Ganjam, Vizagapatam, Rajamundry, and Masulipatam; these were acquired in 1765. But by the treaty concluded with the Moghul by Lord Clive, Gunter remained in the possession of Bazalet Jung, the Nizam's brother, to be enjoyed by him as a jaghir during his life, and it was not until the year 1788 that the country was finally transferred to the E. I. Company. In the district of Gunter, in one year, in consequence of drought, a famine destroyed one-half of the population, and caused a loss in revenue, for ten years, estimated at £50,000. The agricultural population are Teleng.

GUNYA, the gnomon, or carpenter's square.

GUPTA, a Sanskrit word meaning concealed or hidden, hence, Buddhist, from Gupta and Avadhuta, to resemble. Gupta-Para, from Gupta, and Para, a division of a town.

GUPTA, a dynasty that ruled in India from a.d. 319 to 465. They succeeded to the power of the Andhra. When in the plenitude of their power, the province of Northern India, with the province of Gujarat, was under their rule, and Samudra Gupta recorded on the Allahabad pillar that the whole of Southern India as far as Ceylon, also Assam and Nepal, were subject to them. About a.d. 465, Skandagupta lost Saurashtra and all their western provinces by the rebellion of his senapati Bhatarka, the founder of the Balabhi family. Two years after this event Skandagupta died, and the Gupta race were dethroned by foreign invaders, supposed to have been the White Huns. The Gupta dynasty were Buddhists, and one of them, Chandragupta II., made gifts to the tope at Sanchi which are recorded on its rail; but their other inscriptions on the lateral at Allahabad and Bhutari show a decided tendency towards Brahmanism. The following are tables of the Gupta kings, according to the views of writers who have made them a subject of special study:

Ferguson, pp. 725-6; J. R. A. S., 1880.

GUPTA VADHUTA, a mendicant branch of the Sakta sect of Hindus. An ascetic Hindu who does not avow his profession of mendicancy, or who observes its practices in secret.—Wilson.

GUPTESWARA, a title of Siva.

GUR. HIND. DUKH. Unclarified sugar; raw sugar with treacle or molasses, whether the product of the sugar-cane or of any of the palms; written Goor, also called Jagari. Gur-aik or Gud-aku, tobacco for the hookah, from Gur, and Aku, a leaf.

GUR, an epithet applied to Vrihaspati, Lord of the Bull, the Indian Jupiter, from Gur, preceptor or guardian.

GURJENDA. SINGH. A tree in Ceylon, the wood of which emits an offensive stench. Thunberg stated that it is neither the Sterculia foetida nor the Anagyris foetida.—Tennant.

GURKHA MAHR. A cow-keeper, a cow-herd, from Ga, cow, and rakha, to keep, the source of the Gurkha name.

GURAIL. HIND. The shamas of Kangra.

GURAN, a Kurd tribe of N. Persia. All-Hali sectarian belief in Persia is chiefly confined to the genuine Persian tribes of Lad descent, also among the Gurian Kurd, and around the higher parts of Zagros. Other Mahomedans accuse them of practising rites at night; and it is generally allowed that they preserve their customs a secret. They make use of wine and spirits, and eat swine's flesh.—MacGregor, p. 21.

GURAO. MAHL. According to Wilson, a mixed caste usually employed as the servant of the village temple, sweeping it, and deckling the village idol: he is also the village trumpeter. In the Dekhan.

1271
the Gurao is supposed to be the illegitimate offspring of a Brahman with a woman of another caste. They are now in very varied employ.—

Wilson. See Baluta.

GURKHA. The much-feared and respected caste of the Nepalese. In the Indian district of the Gorkha tribe is the seat of the ancient kingdom of Nepal, under the rule of a dynasty of Chetas—Hindu, and at one time independent. As early as 

1272

the GURKHA, a tribe of Afghans on the N.W. frontier, many of whom live in the hills, and some in the plains. They can muster about 2000 fighting men. Their hill frontage is not more than 20 miles long, but it is intersected by about 30 passes. Towards their southern limit stands the fort of Hurrund, a strong masonry structure, erected by Sawai Mull for restraining them. Near Hurrund is an important pass leading towards Kangdhar. Raids of theirs were reported in 1850, 1852; and in 1853 it was proclaimed that any of their hillmen found in the British territory would be seized and placed in confinement. In 1854 their headman entered into engagements to protect the passes, on which account they received an allowance of Rs. 1000 per annum. A section of the Gurkhani tribe are termed Lishari, who were always ready to join in forays with the Murrees, a more powerful tribe. In 1850 one raid was reported against them; in 1852, one; in 1853, four; and in 1854, four. These raids were not, however, successful. In front of the Gurkhanis and Lishari hills, and between Hurrund and Mithunkote, are plains inhabited by the Dreshuki, British subjects.

GURDASPUR, a district in the Amritsar division of the Panjab, with 906,300 inhabitants. The town is 44 miles from Amritsar.

GURDEZI, a country between Ghazni and India.

GURDEZI, properly Gardezi, a class of Syuds in Jowlee of Muzaffarnagar. They claim connection with the Barh Sudat.—Elliot.

GURGAN, the modern Vehren or Hyrcania.

GURGAON, a British revenue district in the Panjap, lying between lat. 27° 39' and 28° 30' 45" N., and long. 76° 15' and 77° 15' E.; area, 1015 square miles; population in 1868, 696,646. Of these are—Brahmans, 55,402; Bania, 88,214; Gujars, 21,818; Rajputs, 12,867; and Ranghar, 5883. The last two are indolent and thriftless cultivators. The Mina in the Gurgaon district are notorious for their thriving propensities. Devi, under the name of Sitala, as goddess of small pox, forms the chief object of Hindu worship throughout the district.—Imp. Gaz.

GURGHURA or Ghurghuray, Hind. The mole cricket, Gryllotalpa vulgaris. See Insects.

GURGUZ, a kind of battle-axe.

GURJARA, the ancient name of the tract between Jambuka or Jambusir on the Nerbudda and the Tapti river. The capital was named by Hiwen Tshang, Pi-lo-mi-lo or Balmir. This is exactly 800 miles N. of the ruins of Balabhi. This is exactly 800 miles N. of the ruins of Balabhi.

GURJA-RASHTRA, also Gurjara or Gujratith, a name of Gujerat.

GURJ, a Georgian. To say that a Persian lady resembles a Gurji or Georgian, is one of the highest compliments to her beauty. The hazards of Persia contain many lovely Circassians.—Onelegy's Travels, ii, p. 51.

GURJUN OIL, an oleo-resinous liquid afforded by several species of Dipterocarpus, deep brown, transparent, of nauseous odour, sometimes thick and white. The tree grows with a straight stem to the height of 30, 40, and 50 feet before it throws out branches, which grow horizontally, and produce flowers and seeds during the rainy season. If the seeds fall when there is a breeze of wind, they are carried a considerable distance, but very few of them germinate in a natural state. The oil is obtained by cutting a hole in the tree, from the ground, and about 4 to 5 inches deep, and the base is hollowed out to receive the oil. The whole of the hollow is cleared with fire, without which no oil exudes; after it is cleared, the oil exudes, collects in the hollow at the base, and is removed at intervals. The oil is thus extracted year after year, and sometimes there are two or three holes in the same tree, and the tree does not die. The oil is allowed to settle, when the clear part separates from a thick portion, which is called the Guad. If a growing tree be felled and cut into pieces, the oil exudes and concretes on the stem and ends of the pieces, very much resembling camphor, with an aromatic smell also. It is said that the tree yields from 3 to 5 maunds yearly, i.e. 240 to 400 pounds, and the same tree will yield oil for several years. It is a good balsamic medicine, and is very generally employed as a substitute for copaiba; but it would be more valuable as a varnish, as it is preservative to wood, to which it gives, with little trouble of application, a fine surface and polish; it becomes, however, white and milky if exposed to wet. It can be had in Chittagong in large quantities at Rs. 10 per maund.—Local Committee, Chittagong.

GURKHA, a race in Nepal, with broad Chines or Tartar-like physiognomy, small eyes, flat nose, and meagre whiskers, as well as of stout square make and sturdy limbs. The Gurkha, in every description of costume, and in all degrees of raggedness, are to be seen mingled with inhabitants of Kamaon, Sirmore, and Garhwal. The name is said to be derived from the Sanskrit Goraksha, or from Gao and Rakha, cowkeeper, and that the founder of the dynasty emigrated in the 14th century A.D. from Tirhat.

The present inhabitants of Nepal are the descendants of successive tide of invaders from beyond the Himalayan range, and of fugitives from the plains of Rajputana and of Oudh. But when the Mahomedan invasions of India began in the 11th century of our era, many Hindu princes fled beyond the Terai, to find a safe place of shelter in the valleys and recesses of the country round the sources of the rivers Gogra and Kosi. It is from the alliance of these Hindous with the women of the Gurung, Magar, and other Mongol tribes, that the warlike race of Nepal, the celebrated Khos or Gurkha, is supposed to have sprung. They had been settled at the town of Gurkha considerably to the west of Khatmandu for some centuries before the year 1708, when the crisis in their history arrived. Their chief was on terms of friendship with, and nominally subordinate to, the king of Khatmandu. He appears to have had his share in the defence of the state when Muhammad Taghbaluq strove to subject it to his dominion. On this occasion a Chinese army appeared upon the scene, and thoroughly discomfited the invading force. The division of the kingdom into several independent districts by the last of the great princes of the Mal dynasty, about the year 1600, had paved the way for the ultimate success of the Gurkhas, but it was not until more
GURKHA.

than a century and a half after this occurrence that the opportunity presented itself. The interval had been taken up by feuds between the rival chiefs or kings of Bhartagoa, Khatmandu, and Lalita Patan, from all of which the Gurkhas had kept steadily aloof. At this juncture Prithi Narayan, who claimed descent from the rajas of Udaipur, was chief of Gurkha, and his authority was also recognised in Kamaon and Nayakot. The king of Bhartagoa, hard pressed by his opponents, came to him with a request for assistance, and this Prithi Narayan willingly consented to give. But the Bhartagoa chief soon found that Prithi Narayan aspired to be his master rather than his ally, and the three kings made up their feuds, and opposed the Gurkha invader as the common enemy of all. One capital after the other, however, surrendered to Prithi Narayan. One of the kings was slain on the field of battle, a second died in prison, and the third fled to India. A small force was sent by the Governor-General to their assistance, but was recalled without effecting any result. After Prithi Narayan's death the task of conquering the whole of the country was brought to a satisfactory conclusion by his great-nephew the regent, Tappa, a youth of the ruler's youthful grandson, and from that time down to the present the supreme administrative authority in the kingdom has been in the hands of a regent rather than in those of the king.

Bahadur Shah, the regent, undertook an invasion of Tibet in the year 1791. A Gurkha army of at least 20,000 well-trained soldiers crossed the Himalaya and advanced towards the Sampu. It captured and plundered Teshu Lambu, but beat a hasty retreat on the approach of a large Chinese army. The Gurkhas were beaten in several battles, pursued within sight of Khatmandu, and compelled to acknowledge themselves vassals of the Chinese emperor. The Gurkhas then turned their attention to the districts south of the mountains, when their encroachments in the direction of Sikkim brought them into collision. War broke out between the British and the Gurkhas in 1814, and was concluded by a treaty written by Sir David Ochterlony, during the following year, restored the balance, and in February 1816 a treaty of peace was signed, by the terms of which Nepal was deprived of its more recent conquests, and reduced to its present dimensions. The Chinese sent an army on this occasion to assist the Gurkhas, but it arrived too late. One of the stipulations of this treaty was that the British were to have the right to station a resident at Khatmandu. During the Afghan wars of 1840-42, the resident, Mr. Brian Hodgson, averted a collision at the time when the Sikh question had reached a crisis. On the accession to power, in the year 1816, of Sir Jung Bahadur, who was the great-nephew of the regent, Bhim Sen Tappa, a more friendly attitude was observed towards the British Government, and staunch support was rendered during the Indian mutiny, and was rewarded in 1850 by the cession to Nepal of the Chitral Talu.

Mr. Hodgson, the resident, in the year 1833 wrote a paper on the advantages that would accrue to the British Government from inviting recruits from Nepal. 'The Gurkhas see,' he said, 'in foreign service nothing but the prospect of glory and spoil.' Their individual courage was represented as not more remarkable than their innate sense of discipline. They possess 'all that individual confidence, each in all, which grows out of national victory and success.' They had also a contempt for all the peoples of the plains, whom they styled Madhesive and Mr. Hodgson specified 30,000 Dakhreah, or soldiers off the roll, as furnishing a source immediately available. The Nepalese army now numbers more than 100,000 men, and the disapproval of the Khatmandu authorities to too many of their subjects entering a foreign service, have reduced the supply to a very limited extent. Owing to Mr. Hodgson's representations, a Gurkha regiment was included in the contingent force of Shah Shuja for the invasion of Afghanistan. It was practically annihilated in the defence of Charikar towards the close of the year 1841. But after the second Sikh war, the Gurkhas crossed the frontier in numbers to join the regiments which had been named after them, and recruited to a great extent from the hillmen of Kamaon, ended in 1816. The first, second, and third of these regiments were raised at the time of the war with Nepal, and did good service in the course of operations. The Gurkhas were known originally as the 66th Native Infantry, the Sirmur Rifles, and the Kamaon Battalion respectively. The 4th Gurkhas was raised at a later period; and the 5th, or Hazara Battalion, forms part of the Panjnad field force. Wherever there has been fighting on the Indian frontiers ever since the year 1838, these hardy troops have rendered the most valuable service. The whole of the Gurkha force was employed in Afghanistan, and three of their regiments were included in General Roberts' army. The steadiness of one regiment in face of the charge of the Ghazis contributed to the success of the day at Ahmed Khel, and another regiment shared up with the Gordon Highlanders the honour of leading the supreme attack on the strong position taken up by Ayub Khan at Baba Wall. Their record of service under the British flag is the narrative of untarnished valour and unshaken firmness. Every man's tour in India; Princep's Tibet; Fraser's Himalaya Mountains.

GURNAK, fishes of the genera Trigla and Dactylopterus, which have their English names from the grunting noise they make when taken out of the water. Two species, D. orientalis of the East Indies, and D. volitans of the Mediterranean, have the fine rays of the pectoral fins connected by membranes, by means of which they can support themselves for some time in the air like flying fish, and are known as the flying gurnard. Species of Exocetus are the flying fish, and a species of Pegasus is the flying horse.

GUROH. Hind. A band or troop of fakirs. Thus there is the Chistiah, Ba-nawa, the Kalandar, etc. Sar-guroh, leader of a band.

the guru corresponds to an ecclesiastical bishop, and each of the Hindu sects has a superintending guru. These have large incomes, reside in a temple, but make extensive ecclesiastical visitations or tours, accompanied by a band of disciples, who occasionally act as the assistant guru. In popular belief, the guru can work miracles and forgive sins. He can excommunicate and again restore to communion. In his tours he levies contributions from the people of his sect. The Jain have their own gurus.

Gurukkal is the head priest amongst the Saiva sect of the south of India. Gurukkal is also a titular appellation of the Moplah Mahomedans on the S.W. coast of the Peninsula of India.

Gurumata, a convention of the chiefs of the Sikh tribes, formerly held at Amritsar, on all occasions of importance.

Gurumukhi, a modification of the Devanagari alphabet devised by the Sikhs; it does not differ in shape, but the forms of many of the letters are interchanged.—Wheeler, Hist. of Ind.; Wilson.

GURUHADO. Uriya? A tree of Ganjum and Gushtump; extreme height, 22 feet. Rafters are occasionally made of this wood.—Copt. Macd.

GURUNG, a pastoral tribe who are living west of the Magar race, on the slopes of the mountains in Nepal, principally between Jumla and Kirant, at heights of 5000 and 6000 feet above the sea, and found by Captain Sierwill on the higher parts of the Singhalese range. They breed immense flocks of the Barwal goat and sheep, which they use for carriage. They are of a modified Mongolid type, and have 42 branches. They use their own language, which is peculiar, but little known, and used by the Buddhist priests to propagate their religion; and they have also learned the Khas language. They have adopted Hinduism, but retain also their former habits and customs. They eat beef, but do not use milk. The religion of the Khas, the Magar, and the Gurung differs only according as it combines a greater or less degree of the Hindu opinions with those of Buddhism. From their energy of character, love of enterprise, freedom from the shackles of caste, pure military habits, and perfect subjectivity to discipline, they are eminently fitted for a military life.

They form a tribe or clan or race in Nepal, and, along with the Kirant and Magar, also of Nepal, form the principal part of the Nepal army. These three tribes are said to differ only in their religion, according as it combines a greater or less degree of the Hindu opinions with those of Buddhism.

The Jarya, another tribe of Nepal, south of the Gurung, with whom they are intermixed and intermarry. They are Hindu in creed and manners.

GURU SICHER, a peak on Mount Abu, 5700 feet above the sea.

GURZ, an iron club, pointed at one end, and having a knob at the other covered with spikes. Gurz-mar is an order or gurah of fakirs. The members of this carry a gurz, with which they wound themselves to extort alms. The order is said to have originated with a pir named Sayid Ahmad Kabir.—Wilson's Glossary.

GUSHTASP, a Persian king of the Kaianid dynasty, mentioned in the earliest pages of Greek history. He was son of Lohmus; and the son of Gushtasp was Isfadlar, the Apanda or Astyages of the Greek historians. See Persian Kings.

GUTKA PERCHA.

GUTKULI. Malay. The thul or field of an extinct family.

GUTTA PERCHA, MALAY, is the concrete juice of the Isomandra gutta, a forest tree of Penang, of the Malay Peninsula from Penang to Singapore, of Sumatra and of Borneo. It is called the Taban tree by the Malays of the Malacca, and in Borneo it is known by the name of Nia. The ch is pronounced like the ch in the English word perch. The tree grows slowly to from 60 to 70 feet high, and 3 or 4 feet in diameter. Its foliage is of a pale green on the upper side, and covered with reddish-brown hairs beneath; it flourishes luxuriantly in alluvial tracts, at the foot of hills, and in such situations, in many cases forms the principal part of the jungle. The natives had discovered its valuable properties before it became known to Europeans. They constructed from it whips, shoes, traces, buckets, jugs, basins, timba or draw-buckets, and vessels of various kinds, and thus attracted attention to the substance, which has since been applied in Europe to a vast variety of domestic and scientific purposes. Their method of collecting the gum, however, has latterly been of the most destructive kind. They fell the trees at once, and by removing strips of bark at intervals, collect indeed a large quantity of sap at one time, but destroy all future supplies from that source. The tree was formerly very abundant, but all the large timber was soon felled. When 20 to 30 years old, it was cut down, and the smaller branches cleared away. Round the bark of the trunk and the larger branches circular incisions are made, at a distance from one another of a foot or a foot and half, and in a few days all the sap dribbles and falls into a coconut shell or other vessel placed below. The portions of juice are then collected into bamboo pitchers, and carried by the collectors to boil it, at their huts, in large caldrons, in order to steam off the water which has mixed with the juice, and to clear it of impurities. After boiling, it assumes its marketable consistency, and is brought for sale (Cameron). Pure gutta percha is greyish white, but it is generally brought to market of a reddish-brown hue. This is ascribed to chips of the bark which fall into the sap and give it their colour; but in addition to this there are frequently other matters, such as sawdust, purposely introduced as adulterants.

Dr. Montgomery of Bengal appears to have first noticed the native use of this substance in 1843. In 1843, Dr. d’Almeida presented a specimen of the inspissated juice to the Royal Society of Arts, and described some of the advantages which would accrue from its use. This communication led to no results. But another, made shortly after by Dr. Montgomery, was most successful, so that by the united efforts of these gentlemen gutta percha was introduced to public notice, and by the year 1858 about 2000 tons were annually exported from Singapore. In 1881, Great Britain imported 3422 tons of it from all places. A very small quantity, comparatively speaking, is to be obtained by tapping.

Dr. Oxley says that gutta ought not to require an elaborate process. The simple boiling in water, and rolling out into sheets, from which all foreign matter was removed, would probably be employed, and this, he thinks, would be generally sufficient, if manufacturers in giving their orders would take the precaution of requiring that the
GUTTA PERCHA.

GUZ.

article should be strained through a cloth at the time of its collection, and if they would encourage the natives to do this, by offering a somewhat higher price for gutta percha so prepared, a vast deal of trouble and expense might, in his opinion, be thereby saved. The great peculiarity which makes gutta percha convenient and valuable for a variety of purposes is, that when plunged into boiling water it becomes so soft and plastic, as to be easily moulded into any desired form, and this form it permanently retains on cooling. It was the discovery of this quality which first led the Malays to fabricate it into useful articles.

The juices of various trees have been brought to notice as possible substitutes for gutta percha, but none of them have been found to answer, not even the sap of Euphorbia cattiandu from the Coromandel coast, which at one time was considered a likely substitute. The gutta percha from Borneo is not so much esteemed as that from the Malay Peninsula, and doubts exist as to the identity of the trees. It seems to be a practice with the people who collect the gutta percha, to transplant the shoots of Potamonium, or of several other species of Isonandra with that of the true Isonandra gutta. And though this mixture confessedly depreciates the value of the gum, as the products of the several species have to some extent similar properties, the adulteration allows the commercial article to be applied to many purposes in the arts, from which the higher price and the scarcity of the true gum gutta would exclude it. There are said to be five or six species of Isonandra on the Koondals of the Western Ghats of India,—I. Wightiana, I. Perottetiana, I. Candollea, and I. lanceolata; and in Ceylon are I. grandis, and five other species. Some of these, however, have been referred to other genera, or are synonyms. One in the Peninsula, the I. acuminata, Wight, is now referred to the genus Bassia (B. elliptica), which yields the Fashonti, etc. General Oulden brought to notice the Pachonti tree of Malabar, but it was not found of much commercial value. It is said that while taking measures to transplant and cultivate the Isonandra gutta in Guiana, discovered at Surinam a juice-yielding tree possessed of analogous properties in the Sapota Mulleri, believed to be the same as the bullet tree of the English. It is a tall tree, yielding in the hot season a large quantity of milky juice. The tree grows abundantly on slightly elevated situations. The trunk is surrounded with a ring of chay, with elevated edges, and then an incision is made in the bark as far as the liber; the milky juice flows out immediately, and is collected in the clay reservoir. The juice resembles in some respects the milk of the cow; it forms a pelicle on its surface, which is renewed after removal. By the evaporation of the juice, 13 to 14 parts in 100 of pure gutta percha is obtained. Six volumes of absolute alcohol, added to ten of the juice, separates at once all the gutta percha and sediment and leaves the ether acts more readily than alcohol. The juice is not coagulated by acetic acid. This Surinam gutta product is sold at Amsterdam at the same price as the best gutta percha of commerce. The coagulated juice of a large climber found by Mr. Sandeman, of Munnipour, in his grant, has been pronounced inferior, inasmuch as it is sticky, and becomes brittle when exposed to cold, and it would be unsaleable in England. A Cachar kind of gutta percha is also brittle, and when dissolved in chloroform or benzole does not dry so quickly as the commercial article, and on heating this water it becomes more ductile and plastic, rather more so than common gutta percha. It is dissolved by the same agents as the latter.

Gutta of Borneo is collected in the Lawas district from at least five species of Isonandra, and adulterated with the juice of Ficus and one or two species of Artocarpus.

Gutta Podah of Billiton is vegetable wax.

Gutta Trap of Singapore is the inspisappated sap of an Artocarpus, used for birdlime.—Low's Sarawak; Singapore Cat. London Ez.., 1862; Indian Field, Calcutta, June 12, 1858; Tomlinson's Dictionary; Barbidge, p. 75. See Isonandra; Pachonti.

GUTTEAH of Chittagong, a tanning substance obtained from a bush that grows on the sides of creeks and rivers, in low ground which is inundated with the spring tide. It is cut for firewood, and the fishermen and shoemakers purchase it, and take the bark off to tan their fishing nets and leather, and afterwards sell the wood posts for firewood.

GUTWARA, properly Gatwara, but more correctly Ganthwara, a tribe of the Jat race who hold villages in Gohana (where they are called Aolan, after their chief town), also in Sonipat Bangur, and in the Doab on the opposite side of the Jumna. They trace their origin from Ghatzi, from which place they were accompanied by the bhat Bajwaen and the blacksmith Buda, of whom descendants are now living, and are engaged in the occupation of their fathers in the villages of the Ganthwara fraternity.—Elliott, Supp. Gloss.

GUTZAFF, CHARLES, a missionary of the Protestant Christian religion, who resided in Siam and China. He was acquainted with several Chinese dialects. He endeavoured to spread Christianity amongst them. He was afterwards an interpreter to the British in China, and Consul of Britain. He died about the year 1868. He greatly encouraged the Tao-ling movement. He wrote a Sketch of Chinese History, Ancient and Modern, comprising a retrospect of the Foreign Intercourse and Trade with China, Lond. 1884.

GUWAR, HIND. A hard refractory bean, cultivated in the Dikhan, steeped, and almost entirely used for animals. 100 parts contain starchy matter, 58-89; nitrogenous, 29-80; moisture, 11-75; mineral constituents (ash), 3-16; and fatty or oily matter, 1-40. It is the fruit of the Cyanopisis psoraloides.

GUWO UPAS, or Poisoned Valley in Java, three miles from Balor. It is about a mile in circumference, and 30 to 35 feet deep. Mr. Loudon mentions that on the 4th July 1830, when he visited it, the floor was covered with the skeletons of human beings, tigers, pigs, deer, pea-fowl, and all sorts of birds. A dog thrust into it, in 14 seconds fell on his back, and died in 18 minutes. Another fell in 11 minutes, and died in 7 minutes.

GUZ, also Gaz, a measure of length, a yard. 3 guz = 1 guntha, and 60 guz = 1 jareeb. The lftli guz is the standard guz, or yard measure of forty-one fingers, instituted by Akbar. After much controversy respecting its length, it was authoritatively declared by the British Government to be 33 inches long; and the declaration has
been attended with considerable convenience to revenue officers, as a bigha measured by this gus constitutes exactly five-eighths of an acre.

Since the middle of the 19th century the gus is generally regarded as the British standard yard of 86 inches.—*Eliot*.

GUZANJABIN, in the province of Kermanshah, is a kind of manna caused by a green fly on the back of the leaf of the dwarf oak. It is very accurately described by Diodorus Siculus. The Persians mix it with flour and sugar, and make it into little cakes, which they consider great delicacies, and export to all parts of Asia.—*Ed. Ferrier, Journ.* p. 26. See Gazanjab; Manna.

GUZERAT or Gujarat, the name given to the northern seaboard of the Bombay Presidency, extending from lat. 20° to 24° 45' N., and from long. 69° to 74° 20' E. The term Guzerat is sometimes also employed to include the peninsula of Kattyawar with its 180 pretty states. Guzerat Peninsula has the Gulf of Cutch on its north-west, and the Gulf of Cambay on its south-east. The area of the whole province is stated by Captain Nasmuth to be 31,752 square miles, of which only 10,736 belong to the British Government, in Ahmadabad, Kaira, Panach Mahal, Broach, and Surat, population 2,857,731, the remainder appertaining to tributary chiefs. Anhilwara was the dynastic name of three races that ruled in Guzerat from A.D. 696 till A.D. 1309, when Guzerat was annexed to Dehli by Ala-ud-Din Muhammad Shah. The name of these dynasties was taken from the town of Anhilpur, which rose to great distinction as a commercial site, and with Cambay as its seaport was the Tyre of India. At its height, Anhilpur was 12' cos (or 15 miles) in circuit, within which were many temples and colleges, 84 chak or squares, 84 bazars or market-places, with a mint for gold and silver coin. Col. Tod thinks it not unlikely that the Chaora, the tribe of the first dynasty of Anhilwara, is a mere corruption of Saura, as the ch and s are perpetually interchanging. The Mahrratta cannot pronounce the ch; with them Cheeto is Secto, etc. He thinks the Saura princes of this little country in all likelihood gave their name to the peninsula of Guzerat. Guzerat was overrun in A.D. 718 by Muhammad-bin-Kasim Walid's general, but when advancing on Chittore he was met by Bappa and totally defeated.

The city of Nehrwalla, says Rennell, the ancient capital of Guzerat, together with the whole of that peninsula, fell into the hands of Mahmud, who died four years afterwards (1028), possessed of the eastern and by much the largest part of Persia, as well as, nominally, of all the Indian provinces from the western part of the Ganges to the peninsula of Guzerat. It was governed by Mahomedans from A.D. 1396 to 1561, as under:—

Muzaffar Shah, A.D. 1396 A.H. 799
Abmad Shah, 1412 815
Muhammad Shah, 1443 847
Katub Shah, 1451 855
Daud Shah reigned one week,
Mahmud Shah, Begara, 1400 863
Muzaffar Shah 2nd, 1351 808
Sihand Shah, 1426 857
Mahmud Shah 2nd, 1526 932
Bahadur Shah, 1526 932
Miran Muhammad Shah Farukhi, 1356 845
Mamad Shah 3rd, 1563 961
Abmad Shah 2nd, 1561 969
Muzaffar Shah 3rd, 1561 969

The lowland of Guzerat resembles that of the Konkan, Canara, the Karnatic, and Orissa, but the interior of the province is mountainous. The alluvial tract is a soil eminently productive, and is occupied by Rajput tribes, Gujar, Kat'hi, Koli, and Kunbi, all claiming a distinct origin. The Koli of Guzerat are descendants of aboriginal tribes who occupied the country before the Aryan conquests. They have long since adopted some parts of Hindism. In the beginning of the nineteenth century they were a restless, turbulent race, despising agriculture, and living by plunder. Before the middle of the century they had settled down to be peaceful husbandmen, and the state of some of their villages vied with those of the Kunbi. In Guzerat the Kolis are of three sections: the most numerous, the Tullabahd (639,141), then the Puttunwaria, the Karez, the Dhandur, and Bhabria. They are in the Baroda district, north to Khyrullu and Massana in the Mahikanta, and form a large portion of the population. In 1853 there were 1,003,287 in Guzerat, Konkan, and Bombay. They are labourers and watchmen; and a few, under the name of Selottah, form escorts of treasure. The Guzerat Kunbi are a remarkably sturdy, independent race, and will often wrangle for days over a slight increase made in their rent.

The district of Diu is Portuguese, and the town of Diu during the past three centuries has been repeatedly besieged by rulers of Guzerat and the Dekhan, but it has continued in the power of the Portuguese.

The Guzerati language is spoken in the Peninsula by Rajput tribes, Gujar, Kat'hi, Koli, and Kunbi, all claiming a distinct origin. Guzerat is bounded by the Marwari a little to the north of Deesa, to the north and east by the Hindi or Rangi Basa of Malcolm, in Rajputana and Malwa respectively; and in the south it dovetails with Maharati in the valleys of the Nerbadda and Tapti, ending at Hamp on the former river, and running into the latter. The emigrants from Persia, now known as Parsees, who landed in this peninsula, have adopted the Guzerati language. In the Dekhan, Guzerati is a term applied to any native of Guzerat, but more especially to the traders and dealers from that country. In Bengal and Behar, one subdivision of the Kurni or agricultural tribe is called Guzerati, having perhaps come originally from thence, or possibly from being of Gujar origin. The Mahrratta and Guzerat Brahmins may eat together, but do not intermarry; and the first approach at social union is seemingly to be with the Mahrratta and Guzerat Brahmins, amongst whom the influence of European knowledge has had more effect than upon any of all the other races in India. Good seed has fallen on a good soil, and from a body of mendicants, these Brahmins have become active, powerful, and useful.—*Imp. Gaz*.

GUZELHUTTY, a pass running up a valley in which the Moyar flows to the Bhawani, between Coonoor and the Neighbour Hills. It is on the GWA or Goa, on the Arakan coast, in lat. 17° 38' 40" N., and long. 94° 38' 30" E.

GWADUR is a village on the north side of the Gwadur Bay, at the foot of a range of rocks. The electric telegraph comes overland here to the eastward of the town, and then up and over the peninsula into the sea, and then to Cape Musendon. —*Findlay*.

GYMNOSOPHII.

GYMNOSOPHII. Putia Periplocasylvestris, and. Voiyt, land Singh, and residence who and the isolated great. nearly had S.E. and its pancies was on Northern Agent cliff same Mandar, karas, others. GWALIOR, whole broadest, north-eivst act capture British of State Bai, is by the artillery, colossal was without sustaining him of artillery, of India, and colossal of the army. The face of the fort is perpendicular, and where the rock is naturally less precipitous it has been scarped, and in some portions the upper parts overhang the lower. Gwalior Rock was scaled and taken by Major Poplam in 1780. Warren Hastings had sent him with a force of 2400 infantry, with cavalry and artillery, to protect Gohtud, sixty miles S.E. of Agra. He captured Lahar, and proceeded to Gwalior. Sir Eyre Coote, commander-in-chief, had pronounced the attempt to capture it an act of madness; but on the night of the 3d August, twenty European soldiers and two companies of sepoys, led by Captain Bruce, scaled and took it without the loss of a single man. It was regarded as so powerful a fortress, that its capture was heard of by the chiefs of India with great astonishment. During the rebellion in Northern India, a massacre at Gwalior occurred on the 14th June 1857, but the town was recaptured by Sir Hugh Rose on the 28th June 1858. The British Indian Government kept a Political Agent at the court of Gwalior, by whom, also, Amjhera, Narwar, Bhandara, Khaltrar, Sarsi, Raghogarh, Baroda or Sheopore, and Barra, are superintended.

There are several caves in the steepest face of the cliff. The Sas Bahu, a great Jain temple, was excavated about A.D. 1093, and the Telki Mandar, originally a Vaishnava shrine, about the same time. In the 16th century, the Jains, on the cliff that sustains the fort, executed the most extensive series of Jain caves known to exist anywhere. Their style of execution is very inferior. The principal group is in the Urwahi ravine, and consists of 32 colossal seated figures of the Tirthankaras, the largest a standing figure 57 feet high. Another group, on the opposite face of the cliff, has 18 statues 20 to 30 feet high, and there are others.—Burgess, p. 509.

GYA. TIBET. A stranger, a foreigner; hence Gya-philing, a Frank foreigner.

GYMNOSPORIA SPINOZA.

let him proceed ever, continuing his penances in severity. Their present representatives are the Viragi and Sanyasi. In the Ramayana they are represented as lying in winter in cold water, living on dried leaves and water. Colonel Wade and Captain Osborne were witnesses to the intermittent algae, and disinterment, of a devotee at Lahore in 1857, who was buried for six weeks in a closed chest. It was suspended in a vault to avoid the attacks of white ants. The seal of Ranjit Singh was on the tomb. The systems of Hinduism and Buddhism encourage austerities; and the reformers Sahib, Sivar, Kabir, Rah- nue, and Chand all favoured it. The idea seems to be connected with the prevailing belief as to transmigration, leading to the infliction of self-torture as penance for the sins of the former or present existence, in the hope of absorption after the present term of life. The austerities are practised in the most varied form, from simple abstaining from marriage, to temporary or lifelong tortures and voluntary suicide by drowning, burning, placing themselves beneath the great wheels of idol cars. The tortures at the Hol festival, the deaths in the Ganges and at the Jagannath car, the prostrations for a pilgrimage around the hill of Govardhan, are of this kind; and in 1866, a Hindu ascetic was sitting in a cave at the editor's visit to Ellora, where he was said to have sat for five years.

An annual flowering plant of the order Capparidaceae, grows in the East and West Indies and America. The leaves of the wild plant are eaten in curries; bruised and applied to the skin, they act as a rubbed agent, and produce a very abundant acrid exudation, affording the relief derived from a blister, without its inconveniences. This freedom from inconvenience is not, however, always experienced. Dr. Wight once saw extensive vesication produced, by the application of the leaves of this plant to a cutaneous tumor to an infantile boil. The previously existing inflammation of the skin probably gave rise to this extensive action. This and other species are very pretty, and grow well in a light rich soil. The colours of the flowers are white, red, purple, and yellow. At Lahore, the seeds are used by the hakims in convulsions; those of Cleome viscosa are said to be antileptic.—Honigb.; Roxb.; Voigt; Riddell; Jeffery; Wight, Il.

GYNOCARDIA ODORATA. Lindley.
Chaulmoogra odorata, Roxb.

This is a native of Sylhet, is met with on the banks of streams in the Tougphoo forests, and also throughout India generally. It grows to a size equaling the large-size mango tree. When full grown it may be compared to the great maple of our country. It blooms in April and May, and the seed ripens at the close of the year. When the fruit is gathered, the seed is carefully taken out, dried, and sold to the native dealers in drugs, at about five rupees the maund of 84 lbs. Its seeds are medicinal, and have been recommended for tapeworm; and an ointment prepared from them is a favourite application among native practitioners for the treatment of several cutaneous diseases, especially herpes and scrofula. The seeds, Ta-fung-tsze, Chih, are used by the Chinese in leprosy, syphilis, lipoma, and worms. The seeds are sold in the bazaars in India, at about 18s. 1d. per cwt.; they yield by expression about 10 per cent. of a thick bland fixed oil, having a peculiar smell and taste. They are various in shape, nearly oval, smooth, grey, hard; embryo, white. For external application, they are beaten up with ghi or clarified butter, and applied to the diseased cutaneous surfaces three times daily. The expressed oil is prized in the treatment of leprosy in India, also in scrofula and phthisis. The surfaces of the ulcers are dressed with the oil, while a six-grain pill of the seed is given three times a day. The dose of the latter is gradually increased to twice the original quantity. One drachm given to a dog caused violent vomiting in 15 minutes. The expressed oil is sometimes given internally, in doses of five or six minims. Too large doses are apt to produce nausea and vomiting. Its wood is adapted for fancy work and cabinet-making.—Roxb.; Ed. New Phil. Mag., 1856; O'Sh.; M'Cli.

GYPSUM. Shih-kau, Si-il-shih, of the Chinese, is a native sulphate of lime. It occurs as selenite, plaster of-paris, abaster or snowy gyspum, radiated gyspum, and satin spar or fibrous gyspum. Extensive beds of crystalline and compact gyspum and selenite occur near Ennore, the Red Hills, Ootatooor, Nellore, Tisscor, Madura, Bangalore, Sadradas, Masulipatam, Hyderabad, and other localities. It can be purchased in most bazaars in India under the name of Kulnar and Karpoorn sialait, and is used in small doses as a medicine; but the natives do not appear to be acquainted with its use in taking casts, plastering, and house decoration, or in manufacturing Keene's cement. It occurs very abundantly in the Madras Presidency, in the form of fibrous and crystalline gyspum, both free from carbonate of lime and well suited for the manufacture of plaster-of-paris for moulds, busts, statues, or ornaments.

Gypsum of great purity was described by Dr. Jameson as occurring at Jalalpur, recommended for public buildings and ornamental works. In the western parts of Marwar are extensive rocks of earthy and granular sulphate of lime. Selenite occurs in various places in Kattyawan, and at Dholgoun in the Rajpipla country. Granular gyspum is found near the banks of the Tensserim, in
GYPSY.

They call themselves Rom, Romani, Rommon-ehal, or Roman-ehal, two Hindi words, meaning fieldwalkers. Their primitive name is said to be Tzengari. Gypsies did not leave India before A.D. 1000. They entered Europe through Greece, were in Crete in 1322, in Corfu in 1346, and in Wallachia in 1370. Who are their Indian remnant, if any, is very doubtful; but Nat'ch, Babigar, Dom, Korawa, and Yerkal have been named, and in Persia and the Turkoman country, the Kauli and Kara-chi. Their number amounts to about five millions, half a million being in Europe. But races with similar habits are found throughout Northern Africa and great part of Central, Southern, and Eastern Asia, ostensibly working as tinkers, smiths, farriers, dealers in horses, and naturally familiar with them; without religion, unscrupulous thieves: women, fortune-tellers, especially by chiromancy; eating animals which have died a natural death; fly animals, carry corpses, make mats, baskets, and small articles of wood; show great skill as dancers, musicians, singers, acrobats; and there is hardly a travelling company of such performers, or a theatre in Europe or America, in which there is not at least one Gypsy. Their hair remains black to advanced age, and they retain it longer than do Europeans or ordinary orientals.

The gypsies of Bokhara and on the banks of the Zar-afshan river chiefly dwell in tents made of biza, a coarse cotton stuff. The gypsies in the N. parts of Persia lead a wandering life, but always aloof from the other errant tribes; and they go by the name of Karachi, from the Turkish work Kara, meaning black. They exercise the trade of tinkers, and are consulted at times as horse doctors; but they are in general looked down upon by the inhabitants settled in towns and villages, and even by the other wandering tribes. In Kermanshah and Kurdistan, where their number is very considerable, they also lead a vagabond life, and are known by the denominations of Susmani and Kauli. In Ardelen, which is the Persian Kurdistan, there is a large village near Senuch inhabited solely by the gypsies; they are like the Indian Baysides, and dance at the Persian festivals or assemblies, to the music which their husbands perform on some stringed instruments. There are several liyat tribes in Persia, the sound of whose names bear some resemblance with Zigan. These are the Zenghen, once a very considerable, and until now reckoned a very noble, Kurdish tribe of Kermanshah. A branch of them was also transplanted by Nadir Shah into Iruristan, where another tribe of the same name of Zenghen, though of Kurish origin, is established.

A singular class of wanderers, known by the name of Mayadds, visited Lahore in 1868. They spoke a peculiar language among themselves, though when within earshot of Europeans and Indians they spoke Persian. The Mayadds were always armed on reaching the Indian frontier, a fact for which they accounted by saying that they were Shirmans, within the sound of which are the Persian words to sell as slaves. When, says Dr. Lettner, I visited their encampment, their frantic gesticulations, and the hurling of children by one woman to another in order to emphasize her rage, reminded me of a scene recorded in my account of the gypsies of Turkey,... when a case was decided in favour of that side in a tribal contention, which could dance...
most obscenely and use the strongest expressions whilst advocating their own cause. Others of the same tribe appear to have visited Lahore in 1570. In a woman on Bokhara, Mr. Khanoff alludes to three tribes established there, which, he thinks, belong to the gypsy race. They are called Jughi, Mezeng, and Luli; and though outwardly professing Mahomedanism, seem to have no religion at all. General Ferrier mentions that the gypsies in Persia lead a wandering life; each band is independent; they preserve their own ideas of caste as a peculiar people, and with them the dirtiest habits; live upon next to nothing, and detest a regular life and a fixed place of abode. There are more than 15,000 families of gypsies dispersed over various provinces of Persia, paying a heavy tax to the Government. They are called Kauli, also Fal-sen, or fortune-tellers; also Kabir-band, or sieve-makers, because this is their principal occupation; these, their wives, who do not hide their faces, sell from door to door. General Ferrier at Roust Abdullah Khan came on a camp of Kabir-band gypsies, and the moment they perceived the travellers they called off their dogs, who were replaced by the women and children, vociferous for alms. It was impossible to proceed a step, for they hung on the legs, clothes, and bridles of the travellers, and completely hampered them; they were absolutely forced to comply with their clamorous demands. The women had sunburnt complexions; they were tall, with finely developed forms, which they cared as little to conceal as they did their faces. The men were seated at a little distance, making sieves, and apparently quite unconcerned about the proceedings of their wives. These gypsies had the same wandering instincts like all others he met with in Asia.

In Egypt, the men are mostly blacksmitb, braziers, and tinkers, or itinerant sellers of the wares which are made by others of this class, particularly of trumpery trinkets of brass, etc. Some gypsies also follow the occupation of phial-wans or gymnasts, performing feats of strength and dexterity. Many of the women are fortune-tellers. They dress like the females of the lower class, but always go about the streets with unveiled faces. Their cry is, 'I perform divination.' Some of these gypsy women also cry, 'Nedukk-wa-n- tahir! We tattoo and circumsice.'

Professor Sayce says (li. p. 76) that the gypsies passed successively through Persia, Armenia, Greece, Roumania, Hungary, and Bohemia, whence they dispersed towards Germany, Poland, Russia, Scandinavia, Italy, Spain, England, and Scotland. The later researches of Potts, Miclosich, and others leave no doubt as to the Indian origin of the gypsies. Many of the individual words are identical in Gypsy and Hindustani; but the grammar of the first-mentioned language, as shown in the mutilated form which remains in English Romany and the more perfect system of the Turkish Chingian, is quite different from most of the modern vernaculars of India, and has but few points of contact with the older dialects. Somewhere about the year 429 A.D., a number of strolling minstrels did find their way into Persia; they were called Lari, and are described by Firuz in terms which might equally well apply to a band of English Romanies. The word Lari is still used in Persia for strolling minstrels and vagabonds; and, under the form Nuri, it is the generic appellative of gypsies in Syria and Egypt. Arab historians speak of these people under the alternative name of Zutt, which is with much reason believed to be a corruption of Jat. Gypsies in Europe are perhaps the only race who will eat animals that have died a natural death. Mullo haulo, or 'dead pig,' is their favourite delicacy.

In 1844, three years after the appearance of Borrow's Zincaul, or Gypsies of Spain, Dr. A. F. Pott, of Halle, issued a work, entitled Die Zigeuner in Europa und Asien. Later on, Professor Miclosich of Vienna published in parts an exhaustive treatise, Uber die Mundarten und die Wanderungen der Zigeuner Europas; and in 1870 Dr. Paspati published, in French, at Constantinople, a magnificent monograph on the language and literature of the Turkish gypsies, with the title Etudes sur les Chingianes. The Romany language is spoken with the greatest purity by the gypsies of the Ottoman empire. M. Paul Bataillard has also made a valuable contribution towards the ethnology and history of the Romany race, in his L'Apparition des Bohémiens en Europe (1844). Of those who have followed Borrow in his investigations of the English gypsy dialect and traditions, the most noteworthy are Mr. Charles G. Leland (Hans Breitmann), Dr. Bath Smart; and Dr. Smart's Dialect of the English Gypsies. A volume of ballads in Romany and English was compiled jointly by Mr. Leland, Professor E. H. Palmer, and Miss Janet Tuckey.—Lane; Ferrier's Journal; Pottinger's Travels; De Bode's Travels; Peschel; Sayce, p. 76.

GYPSY APPLE. Popowich speaks of the gypsy apple as a small black fruit unfit to be eaten. A fruit was shown to Baron de Bode in the forests of the Zagros mountains, on the road from Kermanshah to Baghdad, called by the natives Angur-i-Kauli. It grows on the mazi or gall-tree, of a yellowish transparent colour. On account of its glutinous property, is sometimes used as glue.

This tree is widely distributed throughout the world. It is called Tanaku and Kamar pulki in Telugu, and Zaitun in Hindustani. The wood is very light, soft, and white, and is much used at Condapilly, in the Northern Circars, for making light cavadi boxes and toys, and it takes paint and varnish well. It is also preferred before all other woods for making catamarns; necklaces and rosaries are made from the seed.—Roxb.
